Entered at San Francisco Postoffice as Second-Class Matter.

EDITORIAL

Greeting!

It is pleasant from time to time to meet in person those whom you have long known by reputation or through correspondence; and in a similar way it is pleasant once a year to drop the editorial 'we' and talk directly to the large circle of friends that editorship of the *Mining and Scientific Press* gives to the fortunate one who sits in the editorial chair. Not that the chair itself is much, 'tis indeed but a rickety old thing that long since should have been sent to the shop, but it is well placed, in that next to it is another, into which from day to day drop for a few minutes, men from various parts of the world, each pausing to greet the editor and, yielding to quiet insistence, to give some bit of news or promise of an article; each in turn going on to some other quarter of the globe, there to take part in the active work of the profession. Gentlemen, this paper carries you my New Year's greetings and sincere good wishes. It also carries, I am sure, the thanks of many readers for that bit of news and for the article; though as to that, some promises evidently have been overlooked or there are many manuscripts lost in transit.

However, there are kindly recollections of your call in San Francisco and earnest hopes that you may again climb the steps and find your way down the hall to the chair that is waiting. The greatest reward that comes to an editor of the *Mining and Scientific Press* is the friendship of the men of his profession. Five years ago when Mr. T. A. Rickard purchased this paper he announced it as his ambition "to win the aid and to deserve the support of those who are engaged in mining, smelting, and the allied occupations, in the West first, and in the English-speaking world afterward." How well he succeeded is known to every mining engineer. When he went to London to establish *The Mining Magazine*, it was my privilege to fall heir, first as an associate of Mr. Courtenay De Kalb and later alone, to the many ties and connections that Mr. Rickard had woven between the editorship and the mining engineers, superintendents, and foremen who are the readers of this paper. With such a foundation, and the generous help of the many friends of the *Press*, it has been easy to do what an editor may to guide rather than control a paper. The last year has been no exception in the prosperity it has brought to the *Mining and Scientific Press*. The subscription list has grown at an almost embarrassing rate, advertising and reading pages have been added until today is issued the largest number of the *Press* ever published and the new year starts with every assurance of good business. These things seem to prove that Mr. Rickard was right when he announced his belief that "a paper which arouses the interest and stimulates the thought of technical men will receive such measure of support from them that those also who sell machinery will find it a remunerative vehicle for the offer of their merchandise."

American technical journals stand alone in the wealth of matter and illustration that they give their readers at low cost. It is an open secret that they are able to be thus lavish because of the support of the advertisers. For each regular issue of the *Mining and Scientific Press* the subscriber pays approximately six cents. That copy costs the publisher for paper, press-work, binding, and mailing, seven and a half cents; to which must be added the cost of news service, of illustrations, of editing, of composition, and of all office and incidental expenses. The reader pays materially less than cost for his technical journals; he accepts from the advertisers the remainder. Does it ever occur to you that such acceptance carries with it the obligation to give a respectful hearing to what the advertiser has to say, and to consider his wares on their merits? Every respectable publication is as careful in selection of advertisers as of contributors, and every paper, the *Press* among others, each year rejects offered business to protect its readers. The interests of reader, publisher, and advertiser are thoroughly interwoven. One can not be harmed without hurting all. Therefore, gentlemen, when you order machinery be fair and remember the advertiser.

I would not have you think that the advertiser controls the paper. He does not, and to be just to him, it is only most rarely that he attempts even to influence it. The *Mining and Scientific Press* is independent because it can afford to be, and when it can not, it will go out of business. It is published by the Dewey Publishing Company, of whose stock all shares, save a few in the hands of old employees, are owned by mining engineers. Mr. T. A. Rickard owns now, as he has for five years, a large controlling interest and he has every expectation of continuing to own it indefinitely.

In the routine of the office, 1910 was an interesting year. In May the paper celebrated its fiftieth birthday, emphasizing its position as the oldest mining journal in America. In July Mr. Courtenay De Kalb harkened to the call of the mine and left for Mexico to assume direction of the affairs of the Pacific Smelting & Mining Company, from which vantage point he still occasionally sends contributions to the editorial page. Mr. Thomas T. Read gave up his position in the Imperial Pei-Yang University at Tientsin, China, to become associate editor. He has since been visiting Korea, Manchuria, Siberia, France, Spain, and England, and is now about to take up active duties at San Francisco, to which he will bring a large first hand knowledge of those countries as well as enthusiasm and proved ability. In the interim between Mr. De Kalb's going and Mr. Read's coming, Mr. W. H. Storms has generously assisted in the editorial work, and in addition correspondents and contributors, to name whom would be but to list the active men of the profession, have helped to make the paper interesting and valuable.

Gentlemen, on my own behalf and on that of the stockholders of the company, I thank you one and all.

H. Foster Bain.

January 1, 1911.

EVEN our extra pages do not permit us to publish this week all the good things available and a number of articles and reviews arriving a little late have been regretfully held over for later issues.

COLORADO and its declining mineral output has been the subject of much recent comment. We are glad to present an authoritative analysis of the subject by so loyal a Coloradan as Mr. Theo. F. Van Wagenen. That there has been a decrease in production is clear, but that there is much of encouragement in the present situation is equally evident.

LACK OF WATER to continuously supply power to the mines in some portions of California during the past year has lowered the gold output. Many mines depend upon hydro-electricity and when the rain and snowfall are light, the mountain reservoirs empty early in the season. This is not because of light rain or snowfall so much as inadequate storage capacity. There has not been a year within the history of mining in the State when precipitation was not sufficiently great to have supplied all requirements had the reservoirs been large enough to retain the run-off. They never have been, however, and now nearly all the important water reservoirs, the canals, and the flumes, have passed

into possession of corporations whose interests often are only indirectly with mining.

GEOLOGISTS who attended the meeting of the International Geological Congress at Stockholm last fall returned delighted with Sweden and its people. We are glad to present to those who stayed at home, echoes at least of the affair, in the articles by Mr. James F. Kemp and Mr. H. V. Winchell. That by Mr. Winchell is but a part of an address that he delivered before the Minnesota Academy of Science.

COPPER has been the centre of interest in 1910 as in 1909. There has been much talk of mergers and of curtailment, but the review of the year by Mr. M. E. Appelbaum, president of the New York Metal Selling Company, as well as detailed statistics furnished by the Copper Producers' Association, shows that steady prices have been maintained mainly because consumption increased with production. This is as it should be.

PROGRESS in treatment of gold and silver ores is again reviewed for us by Mr. Alfred James, whose position in London and whose world-wide connections, enable him most effectually to annually sum up the year's achievements. Mr. James' letter has become an institution, and it would be difficult to measure its influence. This year we supplement it with a special review of improvements in cyanidation in America, written by one of the younger engineers who has accomplished things of importance, but who modestly forbids us to use his name.

LONDON'S importance in the mining market is indicated in the illuminating article by Mr. T. A. Rickard in this issue. The reason for its premier position lies in the fact that Great Britain's investments in other lands amount to about £3,000,000,000 (not dollars), from which a return of fully £150,000,000 is received annually. Metal mining, omitting coal and iron, contributes about £30,000,000 per annum to the British public, half of the amount being contributed by the gold mines. Despite all sorts of follies and extravagancies, the final result is remarkably good. Owing to the expansion of trade and the resultant accumulation of capital, it is safe to say that London is ready and prepared to finance sound mining enterprises, concerning which trustworthy information is furnished and on which reasonable terms are offered.

FIFTY YEARS AGO the *Mining and Scientific Press* began its second volume. Among other items in the issue of January 4, 1861, that read strangely now, was a note that "The news by last Pony from the Southern States is of gloomy aspect. South Carolina has virtually seceded from the Union." The germ of our modern review number was an estimate that "Forty-two million three hundred and twenty-six thousand dollars have been sent from the State during the year." A description of a "steam quartz mill" then being erected at Murphy's, in Calaveras county, California, states that the engine, "seventy horse-power, thirty-inch stroke, and fourteen-inch cylinder" was to be placed in the second story. It is comforting to know that the mill was "built of heavy timbers and with double floors." An editorial that might almost be clipped and re-used today voices the miners' protest against enactment of any mining law. A local paper is quoted: "We ask no mining laws, for those that have been enacted by the miners themselves, with the decisions of the courts upon them, constitute as excellent a code as can be wished for." There were evidently stand-patters then as now.

The Year in the West

"Prospect in the older districts," is the advice given by Mr. Stanly A. Easton in a recent interview, and it is sound advice. As he points out, the man who goes into a new district takes chances not only on finding ore but on a multitude of other things. In new territory a mining company must provide transportation, food supply, water, power, and all the accompaniments of a complex civilization. In the older districts these are provided and the engineer can devote his whole attention to finding and mining ore. Leadville has this year had another revival due to the discovery of hitherto unsuspected bodies of calamine. A periodic rejuvenation of Leadville, indeed, has come to be expected. In 1911, Cripple Creek is expected to gain greatly in output, and there are already many signs of a return to the activity of earlier years. Completion of the Argo or Newhouse tunnel in 1910 has given opportunity for re-opening old mines in Clear Creek and Gilpin counties, and in the opinion of certain acute observers the San Juan region has a golden future that will eclipse its silvered past. What is true in Colorado is equally marked elsewhere. The remaking of the copper districts of the Southwest that has characterized the last few years is as important as any discovery of new. Among the gold mines of the Sierra Nevada there is as large an interest and as hopeful a tone as at any time in years. Pioche, one of the oldest districts in Nevada, has this year made marked advance despite temporary difficulties over railway transportation detailed in our news columns recently. The recent consolidations of properties there make operations on a large scale possible. The rehabilitation of Republic district, Washington, was one of the achievements of the Northwest, and the fact that its ores contain gold, principally, relieves operators there of worry over the metal market. The Coeur d'Alene district, supplying one-third of the lead produced in the United States, had a year of normal output and extensive development at the big mines, and besides, there appeared a number of new producers. Of the new camps, National and Jarbidge attracted most attention; both are situated in northern Nevada, 75 to 80 miles from any railroad. National has yielded free-gold ore that proved a bonanza to its owners, and Jarbidge, whose début was more or less spectacular, has settled down to steady development, with prospects of proving to

be an important producer of good milling ore. One of the most encouraging features of the mining business of the last year in the United States was this quiet steady progress, unaccompanied by any speculative movement. Money supplied for development and equipment of properties was advanced with a view to probable returns from ore mined, rather than with thought of manipulating the price of shares. Funds were paid in cautiously, but proper and practical use was generally made of them. It was a year during which the tributer gained strong footing. Lessees and lessors alike recognize that the modern system of leasing, wherein supervision is exercised by the owner, results in profitable mining, without allowing the mine to get in bad condition, with undue depletion of ore reserves. The year was further characterized by evidence that miners, lessees, and operators were sticking to the old, well-explored districts rather than seeking mines in unexplored regions; and this faith in the old camps has been abundantly justified by the results. Every experienced mining engineer has lived to see men grow rich and prosperous who came into a camp at a time when he left it in disgust. In the rush for the new, do not neglect altogether the old.

A Rich Man's Mining Law

Law is for the convenience and protection of the people, not for mere perfection as an instrument. As a model of legal excellence the Mexican mining law has won well merited fame. We have taken occasion to expatiate on this fact in the past. It has much in it worthy of emulation, but it has defects which render it less a model for other countries than its ardent admirers would have us believe. Technically it is admirable; in practice it fails to stimulate the industry it was created to facilitate. To protect vested interests is not the chief value of a statute. Protection may become a mere wall, and thus set limits to development. This, in our opinion, is what the Mexican mining law has done. It is essentially a rich man's law and, in mining, the rich and the poor should be partners. We are not aware of any great successes attained by the development of virgin mineral resources that have not been the result of endeavor in the first instance by men who had all to gain and nothing to lose. Prospecting and initial development are essentially functions of the poor man, and the law that does not give the man of small means a chance distinctly limits the expansion of industry.

Mexico is a virgin land, to all intents and purposes. After more than three hundred years of successful mining, the country is just emerging from a condition where mine and bonanza were synonymous. The greater resources in copper, gold, lead, and other substances, are just beginning to be exploited, and the efforts of the men with more energy than funds are needed to redeem the country from dependence upon a single metal. Unfortunately the requirements of the law increase the risk of development to such an extent that in great areas known to be highly mineralized, where many producing mines should be opened, there are nothing but prospects, and but little hope of exploration. To acquire a mining claim it is necessary to make a denouncement, requiring the payment of fees, and the deposit of a sum of money sufficient to cover costs that will accrue by proceeding to title. In theory this is excellent; it necessitates serious purpose and fixed determination to do actual mining. In effect, however, it means that a mineral deposit must possess great superficial evidence of merit before anyone is justified in taking it up, and only a man with money can do it. The only chance for the poor dweller in the hills is to risk securing a petty payment for showing his discovery to some local capitalist or established company. The claim is then too often denounced for strategic purposes, or in the hope of winning a sum of money by promotion. This is further encouraged by that provision of the law which precludes regular mining operations until the patent to the claim has been issued. Theoretically it is sound reasoning to prevent an individual from injuring or depleting a deposit which pertains to the commonwealth until private rights shall have been fully established and confirmed, but the actual working of the law is to deter initiative. The interests of the people would be better subserved by giving the locator a reasonable time, at insignificant expense so far as fees are concerned, to explore the deposit and demonstrate the wisdom or folly of further effort and outlay. A more liberal law would convert a large population from a condition of hopeless serfs and poorly paid laborers into independent, self-respecting prospectors, and would cause the development of the mineral industry at a pace which would insure peace and prosperity. The recent disorders in Chihuahua, which have been falsely colored with the lurid hue of revolution by the yellow journals in the United States, could not have occurred had it been possible for the poor miners to seek their personal aggrandizement through prospecting the mineral districts of the Sierras instead of through relapse into the ancient customs of pillage and banditry.

In the United States the opportunity for the prospector has been widened to almost limitless license. Retardation of development has been fostered by making it so easy to hold a claim that the policy of the dog in the manger is practised in every camp, to its serious detriment. It is clear that a happy mean must lie somewhere between the laxity of the United States statute and the severity of the Mexican. It is right that a man should be compelled to proceed to patent within a reasonable period, but it is not good policy to compel him to take such action until he has had a fair chance to prove the utility of so doing.

It is rather singular to note that one effect of the stringency of the Mexican law has been to play directly into the hands of the foreigner, a purpose which was as far as possible from the wish of Señor Olegario Molina, the Secretario de Fomento, who drafted the existing statute. His effort to bring the foreigner under subjection to the Mexican courts was intended as a step in the direction of preserving Mexico for the Mexicans. In reality that meas-

ure, which was abandoned under the pressure of strong influences, would have produced but feeble effect as against the requirements which make the acquisition and exploration of mines impossible for the poor men who range the hills and find them. A better protection of the resources of Mexico for the Mexican would consist in giving at least a year to make good before larger capital than brawn and will and a little powder were required, and the result would be to immediately stimulate mining.

Opinions may easily differ as to the value of the new requirement for elaborate and costly monumenting. The Mexican mining claim, as now defined by masonry monuments, can be seen from afar, gleaming on the hillsides like buzzard-roosts. No man with eyes in his head need waste his time by locating a property only to find the ground covered by a previous but unsuspected claimant. Technically the protection is perfect on both sides; the monuments must be erected in accordance with the title maps; they must be approved by a licensed surveyor; and finally passed upon by an inspector. In spite of all this costly routine, possession in Mexico as elsewhere can only be made certain by court decree, for frequent errors will occur, either through negligence or intent. The large expense involved, which is quite beyond the reach of the poor prospector, would not be necessarily evil were it not an added burden in securing a title, and the right to mine, in advance of opportunity to develop the property. It would be warrantable after a man had proved that he had found something worthy of such monumental display. The greatest defect in the Mexican mining statute, we repeat, consists in its being a rich man's law instead of a law offering opportunity to all.

Gold Dredging Progress

Dredging attracted much attention in 1910 throughout the world. Money was supplied in London for several undertakings, notably the Oroville in Colombia and the Inambari in Peru. In Siberia the Orsk Goldfields is a company that is trying, despite many hindrances, to exploit a large tract of rich ground. In West Africa two dredging companies of importance may be mentioned, operating on the Ankobra and Offin rivers, respectively. Driftwood and bad climate have proved obstacles, but the gravel is rich enough to warrant further efforts to make money. In California the Oroville company has been a disappointing venture for the Britisher, and it is not surprising that the issue of Natomas bonds had to be taken by the underwriters. English capital is also being used for dredging in Burma, Servia, Guiana, and Tierra del Fuego. On the whole, the prejudice against alluvial mining has been overcome lately, chiefly by reason of the splendid output of the Lena Goldfields. At Nome, Dawson, and in California the year was one of marked achievement as shown by the reviews presented in the pages of this issue. Lack of space prevents publication at this time of interesting descriptions by Mr. C. W. Purington of a Siberia undertaking, by Mr. W. B. Winston of a new Burma dredge and other articles.

Metal Production

GOLD AND SILVER

By the courtesy of Mr. George E. Roberts, Director of the Mint, we are enabled to publish below preliminary estimates of gold and silver production in the United States in 1910. The figures for gold show a slight decrease, due mainly to the falling off in Alaska, with slight losses in Colorado and South Dakota. There were gains in Nevada and California. The latter State regained its old place at the head of the column, a result of the growth of the dredging industry. Among the silver-producing States, Montana maintained a slight lead over Utah, with Nevada ranking third. Production of gold and silver in other countries is summarized in articles in this issue, especially in that by Mr. Rickard.

GOLD AND SILVER PRODUCTION IN THE UNITED STATES

COPPER

Preliminary figures of the production of copper in the United States in 1910 have been prepared by Mr. B. S. Butler, of the United States Geological Survey, and are published here through the courtesy of the Director, Mr. George Otis Smith. In these, and the figures for spelter and lead, which follow, the output for December, and in a few cases for November, has

been estimated. The output of blister and Lake copper was 1,079,000,000 lb., as against 1,092,951,624 in 1909. Figures published by the Copper Producers' Association for the first eleven months of 1910 indicate that the production of marketable copper by the regular refining plants from all sources, domestic and foreign, will amount to about 1,448,000,000 lb., as against 1,405,619,519 in 1909. According to the Bureau of Statistics, imports of pigs, bars, ingots, plates, and old copper for the first eleven months amounted to 255,237,942, and the copper content of ore, matte, and regulus imported amounted to 75,958,712 lb. If the imports for December were equal to the average monthly import for the first eleven months the amount of copper entering the United States for the year was about 338,000,000, as against 321,801,114 lb. in 1909. Estimates indicate that the exports of copper will exceed the exports for 1909, which amounted to 682,846,726 lb., and that they may be as much as 700,000,000. Domestic deliveries for the first eleven months of the year, as given by the Copper Producers' Association, indicate a consumption of copper in the United States exceeding that of any previous year and reaching, perhaps, 770,000,000, as compared with 688,565,243 lb. for 1909. Arizona again takes the lead among the copper-producing States with an output slightly above the production of 1909, which was 291,110,298 lb. The Bisbee district was the largest producer, with an output of approximately 145,000,000 lb. The production of Montana probably did not exceed 285,000,000 lb. for 1910, as compared with 314,858,291 lb. for 1909. The State will therefore rank second. Utah, ranking fourth, made a marked increase in production over 1909, which was 101,241,114 pounds.

LEAD

The statistics of production and consumption of refined lead have been prepared by Mr. C. E. Siebenthal, of the United States Geological Survey, and are based on returns from producers and records of imports and exports kept by the Bureau of Statistics. The total production of refined lead, desilverized and soft, from domestic and foreign ores in 1910 was approximately 469,682 short tons, worth at the average New York price $41,332,016, as compared to a production of 448,112 tons in 1909, and 396,433 tons in 1908. These figures do not include an estimated output of 13,948 tons of antimonial lead, as against 12,896 tons in 1909, and 13,629 tons in 1908. The total production of lead of domestic origin was 379,076 tons, as compared with 345,255 tons in 1909, an increase of about 10%. Of the total production, desilverized lead of domestic origin, exclusive of desilverized soft lead, is estimated at 217,166 tons, as against 194,034 tons in 1909, and desilverized lead of foreign origin comprised 90,606 tons, as compared to 102,857 tons in 1909. The production of soft lead from Mississippi Valley ores is estimated at 161,910 tons, as compared with 151,221 tons in 1909. The amount of lead available for consumption during 1910 may be estimated by adding to the stock of foreign lead in bonded warehouses at the beginning of the year, 17,405 short tons, the imports, 108,268 tons, and the domestic production, 379,076 tons, making a total supply of 504,749 tons. From this are to be subtracted the foreign lead exported in warehouse, 72,345 tons, the foreign lead exported in manufactures under drawback, estimated at 7653 tons, the deduction by liquidation, 7631 tons, and the stock in bonded warehouses at the close of the year (assumed to be the same as at the close of November), 32,446 tons, leaving as available for consumption 384,674 tons, which by comparison with 370,013 tons in 1909 seems to be about a normal decrease. The imports of lead in 1910 are estimated at 47,111 short tons of lead in ore, valued at $1,728,607; 57,472 tons of lead in base bullion, valued at $2,330,383; and 3685 tons of refined lead, valued at $208,172—a total of 108,268 tons, compared with 114,181 tons in 1909. Of the imports, over 83% came from Mexico.

SPELTER

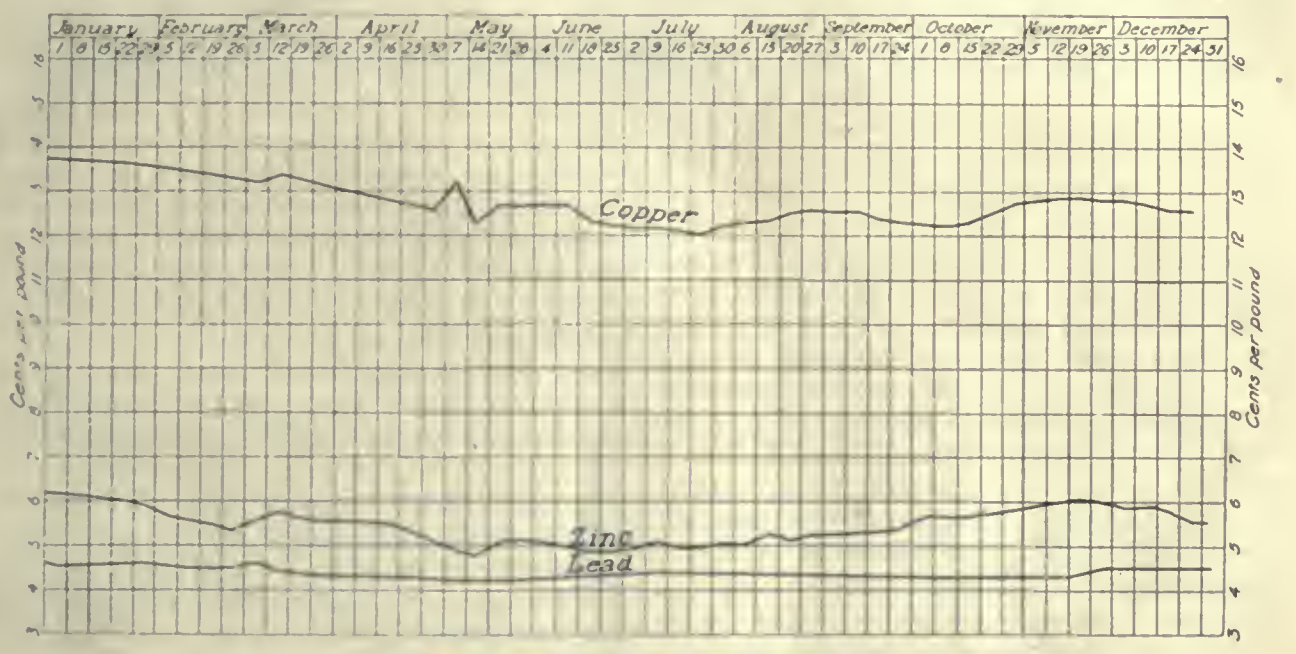
Statistics of production of zinc in 1910 are of unusual interest because of the new tariff, the open market, the closing of certain smelting plants, and the range in prices for the year. Mr. Siebenthal's figures, given below, show that domestic production broke all records, that imports decreased 25%, and exports quadrupled. The production of primary spelter from domestic ore in 1910 is estimated at 250,052 short tons and from foreign ore at 17,371 tons, a total of 267,423 tons, worth, at the average price, $28,881,684, as compared to a total of 255,760 tons in 1909, made up of 230,225 tons of domestic origin and 25,535 tons of foreign origin. The production of spelter from both domestic and foreign ores, apportioned according to the States in which the ores were smelted, was approximately as follows: Illinois, 73,373 tons in 1910 and 67,653 tons in 1909; Kansas, 105,659 tons in 1910 and 103,299 tons in 1909; Oklahoma, 34,762 tons in 1910 and 28,782 tons in 1909; all other States, 53,629 tons in 1910 and 56,026 tons in 1909. The total production of spelter is equivalent to the output of 61,700 average retorts operating continuously through the year, or about 70% of the maximum capacity of the smelting plants in operation for some part of 1910. The apparent domestic consumption of spelter in 1910 may be computed as follows: The sum of stock on hand at smelters at the beginning of the year, 11,167 tons, plus the imports, 3339 tons, and the production, 267,423 tons, gives the total available supply, 281,929 tons. From this are to be subtracted the exports of domestic spelter, 3953 tons; the exports of foreign spelter, 5029 tons; the exports under drawback, 2717 tons; and the stock on hand at smelters at the close of the year (to be exact, on hand December 15), 20,170 tons, a total of 31,869 tons, leaving a balance of 250,060 tons as the apparent domestic consumption, almost exactly the production from domestic ores. This calculation takes no account of the stocks of spelter held by dealers or consumers. On comparing the apparent consumption in 1910 with the 271,274 tons in 1909, the 215,401 tons in 1908, and the 228,524 tons in 1907, it is seen to be about normal, indicating that stocks other than those at smelters have at least not greatly increased during the year.

Metal Reviews

COPPER

By Mishia E. Appelbaum

The beginning of 1910 found copper on a 14c. delivery-30-days basis, for both electrolytic and Lake, and outside of slight rallies which occurred from time to time, the market sagged until it reached 12⅜c. In the second half of the year, due to persistent rumors that a curtailment policy had been agreed upon by the leading producers, the market recovered to almost 13c. and held firmly there until the latter part of November, when, due to heavy decline of securities as well as lack of buying, the market showed a slight reaction. In my last year's review I indicated that the domestic consumption would be approximately 70,000,000 lb. per month, and that we could also rely on Europe taking at least 50,000,000 lb. per month. Because of the excellent demand for copper all over Europe, the Europeans have at times taken much more than this quantity, and as a result the statistics at the end of the year, while still showing a large visible supply, nevertheless encourage hopes of gradual reduction of accumulated stocks. During the coming year several properties will enter the producing list and will swell the production of copper from 60,000,000 to 80,000,000 lb. To offset this, the American producers, and some of those of Europe, have agreed on a small curtailment so that the surplus will not show any increase, even though deliveries be as heavy as in 1910. Were it not for the uncertain outlook, due to the general pessimistic feeling prevalent among men who are well posted on the business situation, and to the fact that the railroads are not ordering equipment owing to the uncertainty as to whether they will be permitted to advance their freight rates, thus increasing revenues and thereby creating a ready market for new securities, the metal outlook would be most encouraging. The business situation, however, is hard to diagnose, and it is therefore difficult to make any prediction as to the probable course of prices during the year 1911, or to estimate probable consumption of copper. The American producers have, so far, kept prices at a low level, enabling the consumers with reasonable safety to carry small stocks, although the recent attempts in some quarters to create the impression that a large consolidation would take place, is to be regretted. The leading copper producers are represented by some of the most brilliant minds of this country, and I would not dare to voice my opinion against theirs, but it seems to me that a real cure for the unsatisfactory copper market, if one is necessary, is to permit the market to be governed by the law of supply and demand. When the surplus of copper will have been reduced to such condition that consumers will find it difficult to readily purchase at their own figures, the metal market will advance on its own accord, and when an advance takes place, based upon such reasons, it will be of a lasting nature, continuing at least, until such time as the business situation again creates an extraordinarily large surplus.



Metal Prices in 1910. New York Quotations.

SPELTER AND ZINC ORE

By R. G. Hall

The position of the spelter market at the close of 1910, as compared with that at the opening of the year, is a particularly strong one, although the ruling price is less, at the time this is written, than it was in January of this year. The average prices by months for the year are approximately as follows:

January	$5.90	to	$6.00
February	5.40	to	5.50
March	5.45	to	5.55
April	5.25	to	5.35
May	5.00	to	5.10
June	4.95	to	5.05
July	4.95	to	5.05
August	5.10	to	5.20
September	5.30	to	5.40
October	5.45	to	5.55
November	5.80	to	5.90
December	...		....

The high prices at the beginning of the year were the result of a sentimental advance following the passage of the tariff bill with its high duty of $0.01 per pound on zinc in ores. The lull in the steel business beginning early in 1910, and continuing throughout the year, caused a corresponding depression in the price of spelter, until a price of less than $0.05 was reached in June. Later in the year, as I pointed out at the time,* it became evident that the failure of the gasfields of Kansas must further curtail the smelting capacity of the country, so that a spelter demand of anything approaching normal would have to be supplied to some extent by importations. It happens, however, that such a normal demand is not in existence, as is shown by the operations of the steel concerns, and the greatly decreased consumption of the early winter leaves the market in a somewhat weakened condition, with no disposition on the part of smelters to sell metal at lower figures. The fact is, were it possible to take an accurate inventory of all the spelter in the country on January 1, 1911, it would be found much below normal, while the smelting capacity has, at the same time, been very much restricted. On the other hand, the position of the ore market is much simpler. After the drop in the prices of all four metals—copper, lead, zinc, and silver—during and following the panic of 1907, many of the larger mining properties of the Rocky Mountain States which had been producing zinc ore, either as a principal product or as a by-product, were obliged to suspend operations; and, consequently, zinc ore buyers, formerly supplied entirely from that source, were obliged to turn, in whole or in part at least, to the Joplin and Wisconsin field.

During 1906 and 1907 the number of smelters in the gas-belt had been largely increased, even to a point beyond the maximum spelter demand of the country. The condition of an industry dependent on the life of a gasfield for its own period of activity is a peculiar one, inasmuch as each concern drawing gas from a given locality where there are a number of other consumers must, of necessity, try to draw the fullest possible supply of fuel at all times. Once the gas in any locality is developed and pipe-lines laid, it becomes then, from one point of view, at least, a matter of time rather than the quantity consumed by any one industry. An idle plant in the gas-belt, while there is gas to be had, is consequently not to be thought of. The effects of this condition are plainly shown in the accompanying table. The base price given is on ore in bins at the mines, Joplin, and is taken from Zook's 'Car Report' of each week, a reliable authority.

The margin shown, based on a recovery of 1020 lb. of metal per ton of 60% ore, covers all expenses from bin to smelter, buying expenses, handling, freight, treatment cost, and freight on metal from gas-belt to St. Louis. The low base-prices are for undesirable ores, or those high in lime or lead. Were this table carried back into 1908 and 1909, the figures would be even more striking in showing reasons for the 'falling by the wayside' of some gas-belt operators. It is safe to say that with a smelting margin of less than $15 per ton, there will be very little new construction of zinc smelters undertaken.

Mining and Scientific Press, September 3, 1910.

Joplin Ore Prices and Margin, 1910

Week ending.	Basis 60%, From.	To.	Value of Spelter, 100 lb.	1020 lb.	Margin, From.	To.
January 1	$46.00	$49.00	$6.062	$61.83	$15.83	$12.83
February 5	40.00	45.00	5.531	56.41	16.41	11.41
March 5	43.00	45.00	5.60	57.12	14.12	12.12
April 2	40.00	43.00	5.4479	55.56	15.56	12.56
May 7	35.00	39.50	4.9083	50.06	15.06	10.56
June 4	40.00	43.50	5.0104	51.10	11.10	7.60
July 2	38.00	41.00	5.035	51.35	13.35	10.35
August 6	36.00	41.00	5.0188	51.19	15.19	10.19
September 3	40.00	43.50	5.2625	53.67	13.67	10.17
October 1	42.00	44.50	5.3875	54.95	12.95	10.45
November 5	44.00	46.50	5.8125	59.28	15.28	12.78
December 3	44.00	47.00	5.71	58.27	14.24	11.24

While the production of the Joplin and Wisconsin fields has, during the past year, remained nearly stationary, there has been a gradually increasing production from the Rocky Mountain States, and, at the same time, there are many new developments today in the latter region, which, while not yet resulting in production, will within the coming year come into the market with further supplies of ore. The most noticeable of these is perhaps the discovery of large bodies of carbonate of zinc in Leadville. A considerable amount of this material has already been marketed, largely to the oxide plants, but also some to the spelter producers. It is true that further development has failed to substantiate the rosy predictions of the press in the early days of the discovery. There does not seem to be an immediate prospect of such a large tonnage as would tend to upset the ore markets, but undoubtedly there will be a sufficient quantity mined to give a new lease of life to the great camp. The importations during the year were not of a significant amount. The relatively higher prices for metal prevailing in Europe, together with the lower freight rates given by the Mexican railroads to European exports than are given for shipments to this country, have diverted much Mexican ore to Europe. Some ore has also been brought in from British Columbia, but that has not been of large amount.

In the United States during the year, there has been practically no advance made in smelting methods. The prevailing practice continues to be the use of the small round retort, common in this country for many years. Improvements in roasting practice, rather than any change in methods, have improved the extraction to some extent. The prevailing type of roasting-furnace in the gas-belt continues to be the Zellweiger furnace, which, owing to its construction, is only available for use in the gasfields. Where acid is made as a by-product of roasting, the Hegler type of kiln is the only one in use today. In smelting in the gas-belt, almost the only type of furnace is the Hegeler blow-furnace of from 600 to 800 retorts. In the coalfields the use of the direct-fired Belgian furnace has been nearly discontinued, and only the producer-gas fired Hegeler and the regenerative, or Siemens types, are in use. Zinc smelting by electricity is not done in

any part of the United States today. Though some experiments have been made in this line, there seems to have been no progress. In Europe, however, much preliminary work is being carried on; and, while it is as yet of no great industrial importance, it is not improbable that the future may see some very interesting developments. In British Columbia the government has appropriated $50,000 for experiments in zinc smelting; and it is not unlikely that some method may be worked out which will eventually keep these ores at home. Much has been said of the establishment of a zinc-smelting plant in Mexico, but so far as known publicly, nothing has resulted. It is hardly probable that anything will come of it, for some time at least, owing to the present economic and industrial conditions of the republic.

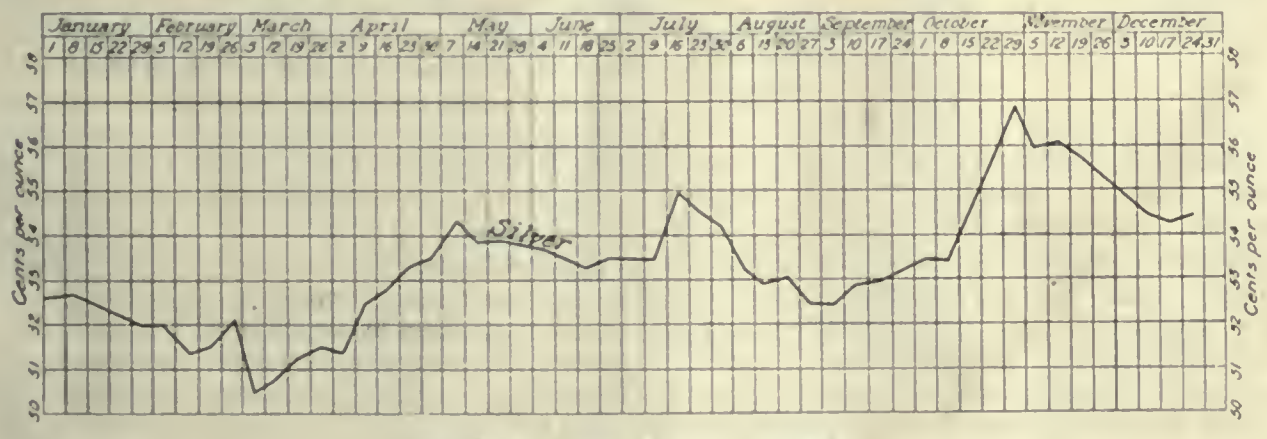
LEAD

By H. Foster Bain

Examination of the graph of metal prices for the year shows that for lead to be a nearly straight line. The range of quotations was from 4.70 in January to 4.28 in May. The average for July was 4.41 and for August, September, and October each, 4.40. Such remarkably uniform prices through a year when other metals have risen and fallen through a much wider range indicates that the lead industry is controlled to a degree not paralleled except in the matter of steel rails. No figures of production and consumption are published except the annual statement issued by the Government, and there is no way of knowing what stock of metal is on hand at any given time. Late in December it was announced by officials of the American Smelting & Refining Co., the dominant interest, that less than a week's supply was available. Apparently there have been good deliveries and no marked increase in production. The Coeur d'Alene district is known to have reached the turning point, British Columbia is not now competing heavily in the United States market, the Leadville output is falling, and neither Utah nor southern Idaho have increased production as was at one time hoped. Leadership in lead production is returning to the Mississippi Valley and in the great deposits of southeastern Missouri, particularly, is the largest known American lead reserve. Conditions have been good there in the year just closed and production has doubtless increased, though at Joplin, despite activity in zinc, the lead output was slightly less than in 1909. In Idaho and Missouri lead can be produced at about the same cost, approximately 3c. per pound, the accessory silver of the one district offsetting cheaper fuel and labor in the other. In Missouri there are large unprospected areas and one of the leading companies has been so successful in drilling for ore as to feel safe in cutting down materially on exploratory work. The Missouri ore is practically non-argentiferous and evidently as smelting becomes more prominent in the Mississippi Valley the copper furnaces of the West will be relied on more to smelt gold-silver ores. There is little encouragement for outsiders to invest in lead mining. Through ownership of smelters and mines, contracts with independent companies, and particularly through affiliation with the National Lead Co., the chief consumer, the Guggenheim interests dominate the situation. They pay the usual penalty of such success in having to face frequent charges of unfairness in buying and selling; such as, that prices of lead are not raised until after favored customers have been allowed to replenish stocks.

SILVER

Last year was marked by rapid and extreme changes in the price of silver, as is shown by the accompanying graph. The range was from 50½ early in March to 56¾ late in October. The close of the year found the price between 54 and 55c. per ounce, approximately two cents per ounce above that on January 1, 1910. As usual, the principal demand has been in the Far East, and prices have varied in obedience to the call of our Oriental neighbors. Just what factors have been at play is not altogether clear, but continued development of China and other Asiatic countries is sure to lead to increased demand for silver so long as it remains the accepted means of storing surplus wealth. In India the establishment of mutual savings banks is drawing into light a surprising amount of silver that evidently has been buried, and in time this may react against further purchases. For the present, however, China and India take the surplus with charming willingness. Mexico continues to be the chief producer. In the United States silver is more and more relegated to the position of a by-product. A rapidly increasing amount of the metal is being used in the arts.



Silver Prices in 1910. New York Quotations.

London Mining Market

By T. A. Rickard

Introductory.—The year now near its close has been one of agreeable interest and prosperity to those engaged in business at this great mining-financial centre. We have had three manifestations of acute speculative excitement in connection with rubber, oil, and gold. Copper and tin have held attention at intervals. No acute collapse in public confidence needs to be recorded, and while failures have alternated with successes, no fiasco of devastating character has to be chronicled. We have much for which to be thankful. War has wrought no havoc to the financial market. Politics may have diverted interest at home, in South Africa, in Australia, and in America, but the results have established rather than weakened confidence. Revolutions in countries of political instability have aroused occasional anxiety, but did no great harm to mining operations. The worst was the three-cornered fight in Nicaragua. The Mexican revolt proved abortive, while those in Brazil and Uruguay cannot be said to have offered any check to activity in mineral exploration.

In Great Britain the general prosperity has created a solid base for financial resourcefulness. Trade has veritably boomed. Statistics for the eleven months exhibit the following contrast:

11 months.	Exports.	Imports.
1908.....	£419,297,046	£536,364,602
1909.....	426,320,091	563,990,656
1910.....	487,065,186	609,359,309

The value of exports for the year is likely to reach £530,000,000, which will be 48% higher than in 1900. Even after allowing 5% for an advance in the price of commodities, it is apparent that the volume of export trade has risen by fully 45% during the decade, while the population has increased 11%. During the interval imports have increased from £460,000,000 to £666,000,000 per annum. At the present time this country is estimated to receive not less than £300,000,000 annually, half as interest on capital invested abroad and the other half from freights, insurance, brokerage, tourist expenditure, and other services for which goods are not given in payment. Naturally, this has stimulated speculation. In the first nine months of 1910 new issues absorbed capital to the extent of £216,000,000, which is £24,000,000 higher than the previous best record. Of the total nearly £100,000,000 went to foreign countries. During the year about £150,000,000 was invested abroad in various ways, private and corporate.

Rubber and Oil.—In the spring the rise in the price of rubber, due to an increased demand in the face of a restricted supply, caused excited speculation both in the commodity and in the shares of companies formed to exploit plantations in various parts of the world, notably the Malay peninsula, the East Indies, and Madagascar. Rubber rose to 12s. per pound. It has now fallen to half that price. And with the fall has come a diversion of the interest taken by promoters in that field of finance. For the present the rubber market has been played to its limit, but as the speculative energy was based on sound economic facts, it has not been followed by the wreckage that results from irrational inflation.

While rubber was still to the fore, an oil boom was started. This also was based on good reasons, for the increased use of fuel oil in motor-engines, both on sea and on shore, has called for an increased production, especially from British territory, hitherto not explored for this mineral. In consequence, Trinidad, West Africa, and Burma have asked for capital. The gushers in the Caucasus and California have attracted operators to those regions, while the Pacific coast of South America, from Ecuador to Chile, has been the scene of oil exploration. Capital has been liberally furnished from London, and, despite the usual proportion of over-capitalization, it is believed that much of this financial energy will prove remunerative, being based on economic conditions and directed, in the main, by competent men.

Before summer waned the oil and rubber excitements had subsided, the share market being glutted with issues in those commodities. Then, in June, came the most spectacular, but also the least serious, event of the year. It was announced in the daily press that a mountain of gold ore had been found on Bitter creek, near Stewart, in British Columbia. A rush of adventurers ensued and one or two silly efforts were made to turn the incident to account by forming companies on mere options. These failed, for the bubble was quickly pricked. It would appear that the episode was encouraged by the railway companies now building to that part of North America, and it was fostered by an irresponsible press eager for sensations but quite ignorant of mining. However, Stewart did no harm. In these days of rapid communication the real facts concerning a mineral discovery are easily obtained. Fraud is difficult.

Tin and Copper.—In August the rise in tin helped the starting of new companies to exploit a promising region in Northern Nigeria, especially in the Bauchi district. The country is elevated and healthy, so that efficiency of labor is possible. Results are now being obtained, but it will be difficult to translate them into dividends on account of excessive capitalization. Some interest has also been taken in tin mining in Bolivia, China, and the Straits Settlements.

Copper, both metal and shares, was the subject of speculation in the early portion of the year. The shares of the new disseminated-copper mining companies in America were bought in London, but the obvious danger of over-production led to hasty sales later in the year. The optimistic promises of those controlling the big low-grade mines in Utah, Nevada, and Arizona pointed to a large output of cheap copper, and had the effect of defeating the effort to invite buyers of shares. Among unpleasant episodes it is necessary to mention the Great Fitzroy, Great Cobar, and Granby Consolidated, all of which suffered a severe check. On the other hand, the year has seen a decided improvement in the position of the Siberian group: Spassky, Atbasar, and Kyshtim. The story of great expectations from Central Africa

has not yet been told, but there are signs of increasing anxiety as to the outcome of the big enterprise controlled by the Tanganyika Concessions. In Peru the Cerro de Pasco, after spending $23,000,000, is still a massive experiment, but it has attracted no English money. Rio Tinto, however, is a standard investment, which dominates the London copper market. At Huelva the announcement of a decreased production, ostensibly to strengthen the metal market, has provoked a smile. In America the amalgamation of the Utah Copper and the Nevada Consolidated was important, and it is likely to be followed shortly by an equally interesting event, namely, the consolidation of the numerous holdings of the Calumet & Hecla.

Transvaal.—Despite the attractions of oil and rubber, of tin and copper, the hunger for gold remains undiminished and the adventurous spirit of the British speculator continues to find satisfaction in the vicissitudes of gold mining. As before, the Transvaal is much the most important of the gold-producing countries, although the rate of expansion is being rapidly retarded. The following figures tell the tale:

MONTHLY RECORD IN OUNCES OF FINE GOLD

1909-10.	Rand district.	Outside districts.	Total Transvaal.
November	576,768	20,997	597,765
December	583,209	21,778	604,987
January	579,743	21,625	601,368

1907	27,410,210	7,091,612
1908	29,986,469	8,751,282
1909	30,925,788	9,504,621
1910	32,000,000	9,875,000
Total	£300,040,310	£74,421,919

*The war period lasted from 1899 to 1902.

This year the output of gold is bigger than in 1909 by about 265,000 ounces or £1,125,925, which is a gain only slightly bigger than for the year preceding. More might have been expected, for several new properties have been started and more machinery, both men and mills, has been at work. But it is fairly apparent that the gold mining industry of the Rand has about reached its zenith of productiveness. Lower costs are not likely to gain on poorer yields, new mines barely balance the exhaustion of the old ones, and increased technical skill only just holds its own as against deeper workings and the difficulties incidental to enlarged excavations underground. Throughout the year the scarcity of labor has threatened to cripple operations, and although this factor has actually affected only a few mines, it has been a constant cloud on the speculative horizon. Statistics show an increase in the supply, but it has not sufficed for the demand, and the efficiency is lower, owing to the migratory character of the Kaffirs.

LABOR STATISTICS

This table gives the number of laborers employed on all the mines of the Transvaal, as well as those on the gold mines only. In 1906 there were 53,000 Chinese at work on the Rand, the last of these being repatriated in January, 1910.

Month. 1909.	Kaffirs on all mines.	Chinese.	Total laborers on gold mines only.
October	166,133	3,199	151,276
November	167,403	3,197	152,245
December	172,077	1,910	155,931
1910.			
January	179,393	1,903	162,570
February	189,155	....	169,771
March	199,549	....	178,345
April	206,680	....	183,814
May	205,709	....	183,964
June	204,898	....	183,431
July	201,672	....	181,514
August	199,944	....	180,831
September	199,644	....	182,200
October	196,699	....	180,103
November	194,756	....	178,027

Several mining companies have ascribed their decreased returns to the lack of laborers, and it is plain that the disappointment in stope-drills has accentuated a critical position. The attempts to economize labor by employment of machine-drills have proved unsatisfactory, although the last has not been said on this subject. Efforts to recruit natives have been widespread. The only prospect for solving the labor difficulty lies in the cessation of work in unprofitable or only barely profitable mines. A more favorable feature of the year is the strong fiscal position of the big consolidations, such as the Crown Mines, Rand Mines, East Rand, Randfontein, and Modderfontein. These enormous properties, consisting of large areas of ore-bearing ground, afford an example of a thing heretofore rare, namely, 'investment' in mines. Such large enterprises, with immense reserves of low-grade gold ore, under experienced management, operating under conditions no longer new, afford a minimum of risk. In so far as they do so they kill speculation, and it is one of the complaints of brokers that the Rand has ceased to offer

opportunities for making money as in days gone-by. It remains to add that 1910 has seen a peaceful invasion of the Rand by American metallurgists and an opportunity generously given for a fair trial with methods and machines already successful in the United States.

In Rhodesia no great progress has been made as regards production, although the last quarter of the year exhibits a quickening pace.

PRODUCTION OF GOLD IN RHODESIA

Month.	1908.	1909.	1910.
January	£199,388	£204,666	£227,511
February	191,635	192,497	203,888
March	200,615	202,157	228,385
April	212,935	222,700	228,213
May	223,867	225,032	224,888
June	224,920	217,600	214,709
July	228,151	225,234	195,233
August	230,792	228,296	191,423
September	204,262	213,249	178,950
October	205,466	222,653	234,928
November	196,668	236,307	240,573
December	217,316	233,397	*240,000
Totals	£2,526,007	£2,623,788	£2,608,701

*Estimated.

In the absence of figures for the production in December, no accurate estimate for the year can be made owing to the extreme variability of output at individual mines, but it is apparent that the total for 1910 will be slightly less than in 1909.

As in the past, the companies operating in Rhodesia have had extreme variations of fortune; unlike the Rand, the northern territory gives the gambler ample opportunity, for what with good cables heralding rich finds and bad cables announcing sudden impoverishment, the holders of Rhodesian shares have had plenty of food for excitement. Fluctuations in quotations have been tremendous, as is shown by the accompanying table:

HIGHEST AND LOWEST QUOTATIONS FOR RHODESIAN SHARES DURING 1910

	Highest.			Lowest.		
	£	s.	d.	£	s.	d.
Eldorado	8	3	9	2	18	9
Enterprise	3	18	9	2	3	9
Giant	5	8	9	3	8	9
Globe & Phoenix	3	0	0	1	6	3
Jumbo	1	5	0	0	11	3
Selukwe	1	5	0	0	3	0
Surprise	3	15	0	0	6	3
Wanderer	0	11	6	0	3	3

The Globe & Phoenix, the Giant, and the Eldorado are the largest producers. The first was non-productive for several months owing to repairs in the shaft and remodeling of the mill, but continues to yield high-grade ore down to its seventeenth level. But the most important event in Rhodesia is the uncovering of a big deposit of gold-bearing agglomerate on the Shamva claims in the Abercorn district. Already 25 to 30 million tons of ore expected to yield a profit of 10 to 12 shillings per ton is said to be assured, and actual reserves exceeding 1,000,000 tons of 5 dwt. ore have been proved. This should become one of the big gold mines of the world.

West Africa has felt the lack of labor, as well as other obstacles to profitable operations. The output of gold is considerably less than in 1909, despite the application of ample capital and increased technical skill.

PRODUCTION OF GOLD IN WEST AFRICA

Undoubtedly London is disappointed in the Gold Coast; it does not yield the only fruit by which mining is gauged: dividends. Brief periods of speculative bidding for shares on the news that big firms were buying interests or providing working capital have been followed by longer intervals of lifeless depression. Eleven years of effort and promise have fructified in a paltry output of gold and two dividend-paying companies, whose working costs are 33 and 47 shillings per ton, respectively, as against an average of 17½s. on the Rand. Various reasons are given to explain this poverty of achievement: the climate, the poor food, the scarcity of native labor, and the expense of a white staff, the members of which require frequent chances to recuperate a vitality lowered by tropical conditions. These obstacles are not imaginary, and until they are overcome in part, at least, no noteworthy growth of industry is at all probable. However, these facts are becoming understood and organized effort is being made to overcome the worst of them.

Australasia.—Leaving Africa we turn to Australasia, which has been so liberally irrigated by British capital during the last twenty years. The most vivid episode was the Bullfinch excitement in October and November. This arose from the finding of rich ore in a mine situated near Southern Cross, a West Australian district that participated vainly in the boom of an earlier decade. Southern Cross or Yilgarn was one of the earliest localities exploited in Western Australia, being discovered in 1887, seven years before Coolgardie and Kalgoorlie. The new find was used as the basis for the Bullfinch Proprietary, itself an overcapitalized affair and followed by a series of issues of crescendo absurdity. An entire absence of reports by independent engineers formed a disagreeable feature of this speculative splutter, and the rapid collapse of the incipient boom left an impression that the public has gained slightly in its ability to diagnose good business from bad. The Mount Maroomba flutter in the Northern Territory was a fiasco, and the discoveries at Tanami have proved unimportant. These were two 'excitements' that gave rise to the hope of new mining districts. The accompanying statistics show

that Western Australia has been losing ground steadily, owing to the exhaustion of the big mines. In 1910, however, for the first time in many years, three promising new developments can be chronicled: at Bullfinch, as already mentioned, at Youanme, and at Meekatharra. The big mines at Kalgoorlie are on the decline, and recurrent disputes over dwindling reserves only serve to warn the public that their glory has departed.

PRODUCTION OF GOLD IN WESTERN AUSTRALIA

Victoria	2,872,990	2,897,340	1,927,500†

*Estimated. †For 9 months only.

In Victoria, once the most productive gold region in the world and later famous for its deep mines, the British public now takes scanty interest, for the 'deep lead' companies, which represent the last effort to enlist English capital, are defunct. Final obsequies were performed during the past year. That gloomy chapter is closed. On the whole London's participation in Victorian mining has been a succession of failures. The best mines were never offered in England. However, domestic capital, chiefly from Melbourne, has been profitably employed, particularly at Ballarat and Bendigo. The latter, famous for its saddle-reefs, has had a revival due to the finding of rich ore on the Sheepshead reef, one of the anticlinal axes parallel to the main 'lines of reef.' The new discoveries are at a relatively shallow horizon and may stimulate lateral, as against vertical, prospecting. Dredging has proved successful in Victoria on a small scale at several localities, but lately trouble has been made by the farmers, as in other districts where river-beds are being uptorn in the course of systematic digging for gold.

New South Wales looms large in the eyes of the London financier by reason of Broken Hill, the mines of which district belong geographically to New South Wales, but industrially to South Australia. On the Barrier range, synonymous with Broken Hill, the application of the flotation processes has given fresh life to the exploitation not only of the large reserves of low-grade ore in the mines, but to the treatment of the big heaps of tailing, the refuse from former milling operations. The output of concentrate, averaging 47% zinc, will be about 430,000 tons for the year, which represents about one-fifth of the total world production of spelter. The higher price of the metal has helped to augment profits and to justify the formation of companies to beneficiate the old tailing, which, as now treated, averages about 20% zinc, 8½% lead, and 10 oz. silver. The lead and zinc concentrates are shipped mainly to Germany, thus provoking Australian jealousy of the European markets and inciting talk of an export duty. The Great Cobar copper mine was the victim of a metallurgical blunder which almost wrecked the enterprise. However, as the mine contains plenty of ore and the plant has been re-organized, the shareholders are hopeful. But it has been a severe trial.

In Queensland the year has been darkened by the Great Fitzroy fiasco, due to an error in sampling and to a mistaken application of water concentration. On the other hand, the Mount Elliott and the New Einasleigh are two copper enterprises that give promise of substantial returns. At Charters Towers the deeper workings on the Brilliant and Day Dawn lodes continue to give excellent results. But the Mount Morgan is still the chief pride of Queensland. Up to November 30, 1910, this mine had yielded (since 1886) no less than £16,507,000, of which £1,335,000 was due to copper and the rest derived from gold. During the year the completion of the railway to the Many Peaks mine has afforded a needed supply of basic flux, suitable for admixture with the pyrite smelted at the old mine.

In Tasmania the Mount Lyell, which now includes the North Lyell, has done fairly well, the output of the two mines yielding a satisfactory smelting mixture. An interesting recent change is the shipment of the blister copper to Port Kembla, in New South Wales, instead of Baltimore. British capital is not interested in Mount Bischoff, the great tin mine, which has recently received increased technical aid, but it is responsible for the Briseis, a 'deep lead' near Derby from which much was expected at one time. The copper discoveries at Mount Dundas and Mount Read have been financed in Australia, but the Tasmania, an old gold mine near Launceston, has been the subject of a reconstruction, which was barely effected when good ore was found on the 1370-ft. level. If this English company has any luck the effect will be to encourage speculation in Tasmania; if not, then otherwise, for a good deal of money is involved.

New Zealand has been prominent on account of the anxiety over the Waihi, the quotation for which has fallen from £9½ to £5¾ on 500,000 shares. It has been known locally for two years that the lowest level showed impoverishment, especially on the Martha lode, and the efforts to escape the unpleasant fact have only augmented the fears of English shareholders. In September it was announced that the decline in the grade of the ore necessitated a decreased output from £18,500 to £17,000 per week, indicating diminished dividends from 18s. per share for 1909 to 16s. per share for 1910. On the other hand, the adjoining mine, the Grand Junction, has

been doing so well as to justify an enlargement of the mill. Elsewhere in New Zealand the Progress and Blackwater mines at Reefton are owned in London; of these two, the Blackwater is doing well. At the Talisman, near Karangahake, the excessive water has been overcome by new pumps, and recent discoveries on the lowest level are encouraging.

India.—Gold mining is mainly confined to the Kolar goldfield, and the six companies at work are practically controlled by John Taylor & Sons, an old and conservative firm of engineers. The past year has been uneventful, the uneventfulness of quiet prosperity. The four big mines, the Mysore, Nundydroog, Champion Reef, and Ooregum, represent a total capitalization of £1,208,772, having a market value of £5,719,485, on which an average dividend of 11.3% is paid annually. This is gold mining at its best.

GOLD OUTPUT OF KOLAR DISTRICT

Month.	1909.	1910.
January	£173,555	£174,314
February	153,542	170,725
March	170,106	176,231
April	170,578	175,539
May	172,156	175,387
June	171,585	174,923
July	172,552	175,523
August	173,318	175,356
September	173,279	175,687
October	173,496	175,719
November	176,027	175,604
December	203,703	200,000
Total	£2,083,901	£2,125,008

It is apparent that the output of the gold has been fully maintained during the year. The developments at the Mysore, Nundydroog, and Ooregum have been consistently good; the Champion Reef has been in poor ground for two years, and the profits have been seriously reduced, but the grade of the ore discovered during the year has gradually improved and the position is now more hopeful. As regards other gold-mining districts in India, Dharwar has proved a disappointment, and Anantapur continues to hold out hopes for profitable operations.

Canada came unpleasantly to the front during the Stewart fiasco, but since then the Porcupine district has attracted merited attention, following by tentative participation in development. Cobalt has been in evidence through the La Rose, Nipissing and one or two other silver-mining companies, but only to a slight degree. Oil shale in New Brunswick, coal in Ontario, dredging in British Columbia have engaged private enterprise, but on the whole Canadian mining has not been prominent. The liquidation of the Le Roi Mining Co. closes an unhappy chapter; on the other hand, the better results from the Le Roi No. 2 have done credit to Rossland.

Mexico has held a place of importance both in London and Paris. The shares of the El Oro group, especially Dos Estrellas, Mexico Mines, and Carmen, have been boosted by our French friends. The Esperanza has received several setbacks, owing to decreasing profits, but the old El Oro mine itself has done well, with illusive promise of betterment in depth. The year began with the flotation of the Santa Gertrudis, at Pachuca, the purchaser being the Camp Bird company, famous as the owner of a rich mine in Colorado. Another later issue was the Santa Gertrudis South. Improved returns from the Mazapil Copper Co. in Zacatecas have pleased the shareholders and done credit to technical management. The old Palmarejo is doing better. Purchase of the Buena Tierra, at Santa Eulalia, and the formation of the Santa Rosa company mark the continued financial activity of the Exploration Company, so long honorably connected with mining in Mexico. The oil development along the Gulf coast and the ensuing fight between the Standard Oil and Pearson groups provoked comment in London, but the interest has not been expressed in terms of money. It is likely, however, that the coming year may see more active participation. Moreover, several metal mines are known to be under option and may become the basis of new companies shortly.

South America has made no large demands upon London, at least as regards mining. The Poderosa copper mine, in Chile, has given anxiety, but is now yielding high-grade ore. The Braden Copper Co. sold some of its bonds in London; they were freely taken, this enterprise being considered perfectly sound. The Ferrobamba in Peru was about to be exploited by an English group when an enterprising American, A. C. Burrage, suddenly made an offer, probably in the interest of the Amalgamated Copper Co. In Argentina the Famatina has made a new start under happier auspices. In Brazil the St. John del Rey and the Ouro Preto are old companies, which continue to peg along successfully, while in the north the Brazilian Goldfields and other newer concerns are exploring a region that may prove important as a source of gold.

Siberia has loomed big this year by reason of the excellent results obtained from the Spassky, Kyshtim, and Atbasar mines, all of which are controlled in London. Some American capital also is involved in the Kyshtim. But the largest British interest is undoubtedly in the Lenskoie, a Russian company controlled by the Lena Goldfields, an English corporation, which has paid £112,221 in dividends on an issued capital of £1,122,210. The production of gold by the Lenskoie for the last fiscal year, ending October 1910, was worth £1,600,000, of which £600,000 is estimated to be profit. Apart from the magnificence of the yield, the technical man will be astounded to learn that the average working cost is 24s. or $6 per cubic yard. Even an Alaskan miner will wonder at the excessive cost, for the Lenskoie is a drift mine in frozen ground, bedrock being 100 ft. deep. New ventures are in preparation and more English capital is likely to be found for Siberia in the near future, despite the unsympathetic attitude of the Russian Government and the red tape of the Mining Department, both of which are serious obstacles to successful exploitation.

Zinc Production in Australia

By Edward Walker

After years of experimental work, the vast zinc resources of Broken Hill are now being successfully beneficiated, so that the output from the district is approximately one-fifth of the entire production of the world. Twenty years ago Broken Hill was a large producer of the lead and silver derived from oxidized ore. When at depth the carbonates and oxides gave way to sulphides, it was found that zinc was also present and thereafter it soon formed an important constituent of the ore. The two sulphides were so intimately mixed that jigs failed to extract more than one-fifth of the lead, and modern table concentration was a thing unknown. Another fact that stood in the way of mechanical concentration was the high specific gravity of the gangue, especially of the garnet and rhodonite. The efforts of metallurgists were therefore devoted to the discovery of leaching and smelting methods. A vast number of different processes were tried, of which perhaps the Ashcroft and the Fry-Everitt received the greatest amount of attention. The former was a leaching process, the zinc being deposited electrolytically; and the latter was a smelting process, using a soda compound for the production of a liquid slag. The former failed because of its cost and because of the zinc being produced in a spongy and easily oxidizable form, and the latter because all the zinc and much of the silver were irrecoverably lost in the slag. Eventually the various companies decided to go back to mechanical concentration, the efficiency of the jigs was greatly improved, and tables were introduced. In this way the extraction of lead and silver was increased, but still the tailing contained most of the zinc, much of the silver, and some lead; and the silver-lead-zinc slime was also a waste product. Both tailing and slime were stacked or impounded for future treatment. Efforts were made to deal with the problem by means of magnetic separation, but no satisfactory results were obtained.

About ten years ago the selective action of oil for sulphide particles and the agglomeration of such particles into a frothy scum claimed the attention of a number of scientists at Broken Hill and elsewhere. The principles upon which all these various processes are founded have been known for a great many more years than is commonly supposed. I need not go into the matter here, for I gave a history of the subject in *The Mining Magazine* for September 1909. The Elmores were the first to devise a continuous process and to make it work in practice, and their first application depended on the power of oil to lift and float away all the sulphide. This required so much oil and such a big plant that it became obvious that it could have few practical applications. At about the same time Cattermole experimented with oil, acid, and air-bubbles; his patents and those of Sulman, Picard, and Ballot form the subject-matter of a second process. It was adopted at the Central mine at Broken Hill belong-

Minerals Separation Plant at the Sulphide Corporation's Central Mine, Broken Hill, Australia.

ing to the Sulphide Corporation, and is now operated by the Minerals Separation company. Another process, devised by Potter and improved by Delprat, uses no oil but floats the sulphides by immersion of the ore in hot acid solution. This has been used at the Broken Hill Proprietary. Later came the second Elmore invention known as the vacuum process; then the De Bavay process, which depends for its floating power on surface tension chiefly; and recently the Murex process, in which magnetic material is added to the pulp together with oil and sulphate of alumina and the agglomerated magnetic material and sulphides extracted by an electro-magnet. These various types of flotation processes came to the aid of metallurgists at Broken Hill. By such means the zinc sulphide contained in the tailing was separated from the heavy gangue. The concentrate thus produced contained varying amounts of lead, often sufficient to penalize it when sold to the zinc smelters, so it had to be given another dressing on tables to make separate zinc and lead products.

The production of zinc concentrate by flotation at Broken Hill dates from 1903, when the Delprat process was started by the Broken Hill Proprietary, and the Minerals Separation process by the Sulphide Corporation. The Potter process, which was similar to Delprat's and is now incorporated with it, was tried by the Zinc Corporation, which was organized by Bewick, Moreing & Co. in 1903 to work the dumps belonging to the Block 10, British Broken Hill, and Broken Hill South Silver Mining companies. When it failed, the Minerals Separation process was tried, also unsuccessfully, and eventually the Corporation adopted the Elmore vacuum process. Subsequently the De Bavay company started, and last year it was expanded into Amalgamated Zinc (De Bavay's). This company owns some of the dumps at the Broken Hill South; it is treating current tailing from North Broken Hill, and since March last the current tailing from Broken Hill South.

As regards the Minerals Separation, this company is working dumps purchased from the Sulphide Corporation and is treating the current tailing of the Central mine on a royalty; these dumps are nearly exhausted, but the current tailing amounts to 5000 tons per week. Of other mines at Broken Hill, the South Blocks is accumulating zinc tailing for future treatment, Block 14 is trying the Murex process, and Block 10 recently erected an Elmore plant for treating the current tailing, but found it unsuitable for the purpose. Broken Hill South Silver sold some dump to the Zinc Corporation and some to Amalgamated Zinc (De Bavay's); until March last the current tailing was sold to the former and since then to the latter.

As regards the output of zinc concentrate, the total has risen from 57,602 tons in 1904 to 375,906 tons in 1909. The output for 1910 will probably be about 430,000, averaging 47% zinc, of which 120,000 tons will come from the Sulphide Corporation dump owned and worked by the Minerals Separation company, 70,000 tons from the Sulphide Corporation's current tailing, 87,500 tons will be produced by the Zinc Corporation, and 95,000 tons by Amalgamated Zinc (De Bavay's). As the Sulphide Corporation dump is nearly exhausted, it is probable that the total output in future years will never again be as high.

Another important point to remember is that the dump material still to be worked by the other companies is of lower grade than those portions already beneficiated, for in starting the various plants the better portions of the dumps were usually worked first. The average of the material now treated is 20% zinc, 6½% lead, and 10 oz. silver, but there must be many parts of the dumps where the zinc content is not greater than 12%. The average cost of treatment is 8s. per ton, which at present prices is the net value of material assaying 11% zinc, 5% lead, and 7 oz. silver, so that much of the remaining dumps will yield only a small margin of profit. As regards the future price of zinc, we may assume that, as the Broken Hill output, which is the chief factor, will not increase, the present price will not recede. It is not certain how the European producers, some of whom have been obliged to suspend operations owing to their ore being of less value and regularity in content than the Broken Hill concentrate, will be affected by this slackening of the Australian supply. They may be able to reenter the market and so prevent any great increase in the price of zinc.

I have so far sketched the method of treating the zinc tailing and have shown that it is now being utilized to the utmost. There still remains the problem of the silver-lead-zinc slime, and several workers are endeavoring to reach a solution from different points of view. This slime is high in lead and zinc, and contains much gangue, being similar in constitution to the ore. It is not amenable to concentration by tables and even if treated by a flotation process, the concentrate derived from it would be unsuitable for either the lead smelter or the zinc distiller owing to the lead and zinc contents being almost equal. During the early part of this year announcements were made that E. J. Horwood of the Broken Hill Proprietary had succeeded in adapting the sulphatizing roast to this slime in order to coat the galena with sulphate, which is not amenable to the flotation action. After the roast, the slime is sent to the flotation plant, where the blende rises and floats away, leaving the sulphatized lead behind. The success of this process on a practical scale depends on the accuracy with which the temperature of the furnace can be maintained. The process has not yet been perfected. In the meantime the Minerals Separation company has devoted much time to a consideration of another scheme; and their engineers are in favor of treating the whole of the discard of the lead concentrators, without dividing it into zinc tailing, barren tailing, and slime. They consider that any slight loss due to the lower average zinc content will be more than compensated by the greatly increased output. The result of this 'total' treatment will be watched with interest. By adopting this system the Sulphide Corporation, using the Minerals Separation process, has the only mill

in the world that takes a mixed lead-zinc ore and turns out a high-grade lead concentrate and a high-grade zinc concentrate in one continuous operation, and at the same time sends to the dump tailing from which practically all the lead, zinc, and silver have been extracted.

It should be noted that the metallurgy of zinc has altered radically during the last few years. The German firms who buy this zinc concentrate are not so desirous nowadays of having a minimum lead content. Formerly zinc sulphide ores or concentrate having a large percentage of lead were not in demand and were heavily penalized. Zinc metallurgy has undergone changes recently. For instance, the retorts are now made by the hydraulic press and are capable of withstanding reactions quite unsuited to the old porous retort. Many improvements have also been made in the condensers, where the volatilized zinc is caught. The result of these various improvements has been that lead is not the bogy to the zinc distiller that it used to be. In the case of Broken Hill zinc concentrate the lead content has become a necessity to the zinc distiller, for it is of value in collecting the silver present in both zinc and lead sulphides. The new metallurgy provides for the collection of as much lead and silver in the zinc-retort residue as possible, and this residue, instead of being thrown away, is now treated in the lead furnace for the recovery of the lead and silver. The buyers of Broken Hill zinc concentrate during recent years have modified their terms of purchase as regards the lead content. They now penalize any zinc concentrate containing less than 5% lead: from 5 to 8% they pay nothing for the lead; and for anything above 8%, they make an allowance. There is, however, no advantage to the seller in having any more than 5% lead, for every 1% zinc content is worth more than 1% lead, seeing that the prices of the metals favor zinc. Another interesting point is that the payment for the silver in the zinc concentrate is at the rate of one shilling per ounce over a minimum, which is generally about 5 oz., and in the lead concentrate the rate is 2s. per ounce of silver. It is clear that the terms of contract make it advantageous to the seller to get as much lead and silver into the lead concentrate as possible, as long as the lead in the zinc concentrate is not allowed to fall below 5%. This alteration in the terms of purchase receives the attention of sellers, who have to judge which is the most profitable way of treating the zinc tailing. It is clear that the Minerals Separation company had the point in view when deciding to adopt the 'total' treatment mentioned above. This leads me to another question of vital importance to Broken Hill. At the present time the mines are absolutely at the mercy of the German smelters in the matter of zinc concentrate, just as years ago they were under the thumb of English and German buyers of lead ores and bullion. It is not surprising to hear that the mines, under the leadership of G. D. Delprat, the manager of the Proprietary, are agitating for a protective export duty, to encourage the local smelting of the zinc concentrate.

The industry is unfortunately still under the shadow of litigation, which becomes more embittered and more complicated as time passes. More lawsuits are threatened. The action brought by the owners of the Elmore patents against the Minerals Separation company has passed through all its stages in England, resulting favorably to Minerals Separation, and is shortly to be repeated in Australia, in the form of an action by the owners of the Australian Elmore patents against the Sulphide Corporation, which uses the Minerals Separation process. Another lawsuit is being started by the Potter Sulphide Ore Treatment company against the Sulphide Corporation, which will thus be attacked from both sides, the Elmore alleging infringement of the selective action of oil in a flowing pulp and the Potter company claiming the sole right to hot acid solutions. I also understand that the Minerals Separation company is commencing actions in England against the Zinc Corporation and in Australia against the Amalgamated Zinc (De Bavay's) company. The position is further befogged by the Zinc Corporation adopting the Minerals Separation process in the extension of plant now in process of erection, and by the Amalgamated Zinc having an option on the Potter process. Another lawsuit more recently announced is one by the Elmore company against German buyers of Broken Hill zinc concentrate. The German Patent Office granted a patent to the Elmores covering the use of the selective action of oil in a freely flowing pump. Other inventors have not, for one reason and another, obtained in Germany the exact equivalents of their British and Australian patents. Consequently the Elmores claim to hold a master patent in Germany and they contend that they have the right to collect a royalty on all concentrate smelted in Germany produced by any method using oil in a freely flowing pulp. They argue, for instance, that the zinc concentrate obtained by the Minerals Separation process is produced by such a method. It is a ticklish question, and it is not for me to discuss it.

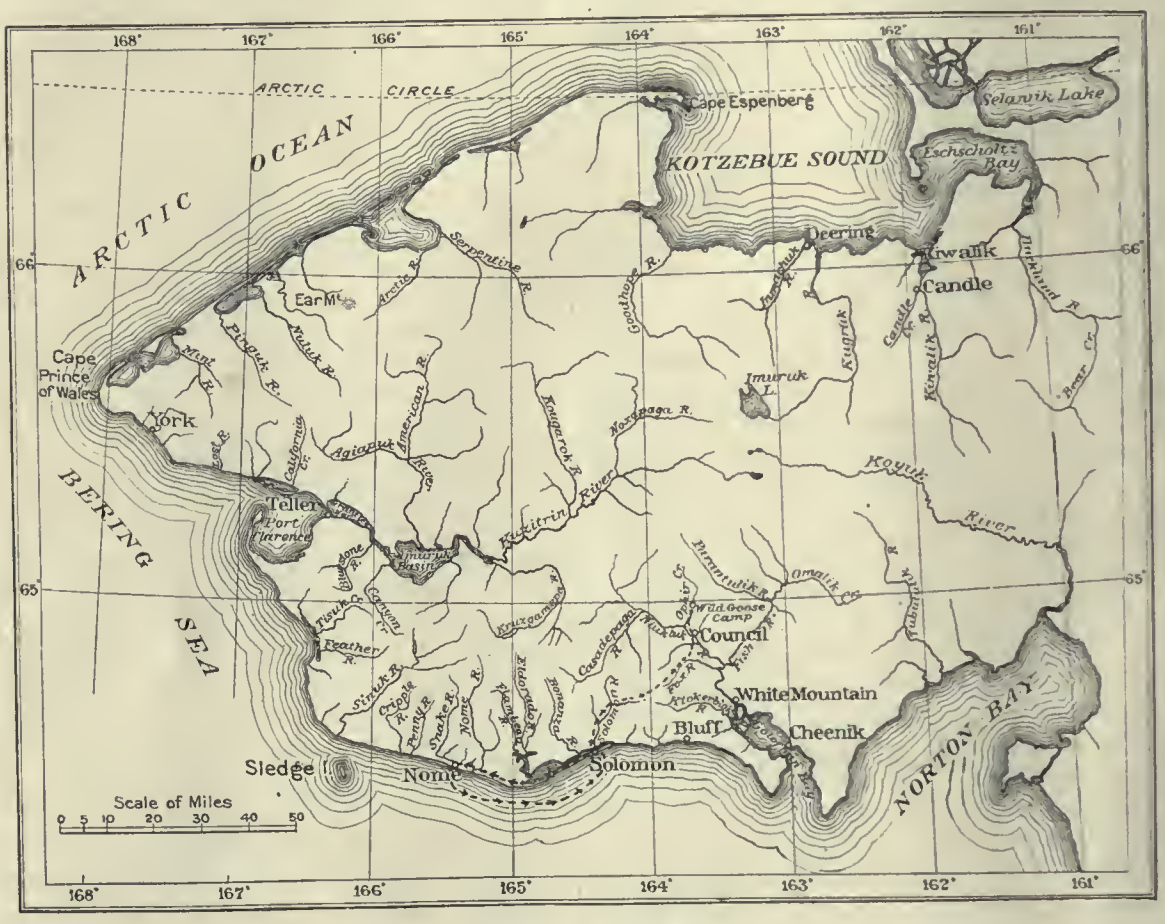
It has always been a wonder to me that the principle of flotation has never found application in America. The chief objection urged by American engineers appears to be that the older plant was expensive to construct, and that the cost of oil, acid, and power was high. I would here mention that the expense of construction and the cost of working have been greatly lowered, and the mechanical efficiency has been notably increased. Most of the processes use very small quantities of oil and acid. For instance, the Minerals Separation plant to handle 6000 tons per month costs about £5000, and when employing oil obtained from the local eucalyptus tree requires only 3 pence or 6 cents worth of oil per ton of ore, and with some ores no acid at all is required. Now that the flotation principle has been proved to be of so great a service at Broken Hill and has secured a lasting position in concentration, American engineers will no doubt once more examine its merits. This article is expressly written in the hope that they will do justice to one of the great triumphs of metallurgy.

Nome Dredges in 1910

By T. M. Gibson

The season of 1910 at Nome was in many ways a most important one. While the output amounted to about $500,000 less than in 1909, being estimated at this time of writing, late in October, at $3,567,608, it may be predicted that the yield was lower than it will be for many years. The reason for the expected increase lies in the number of dredges erected and started on Seward Peninsula this season. Not only, however, were an unusual number of boats launched, but plans for the same sort of activity in 1911 are already being made. At least five new dredges are expected next spring. Two will be made this season, as both the machine and ground are fully up to expectations.

The Plein Mining & Dredging Co. completed the construction of a dredge on Otter creek, a tributary of Nome river, in the early part of September. Mr. Plein, the manager, planned in October to run till November 1. Actually he kept the dredge going till November 26. More permanent frost was found than they anticipated, but the gold tenor of the gravel handled has been above expectations, and on the whole the men concerned are so well pleased with the showing made that they contemplate building another dredge next season. Their dredge has a 3½-ft. open-connected bucket line, revolving screen, and pan stacker. It is driven by steam power, and crude oil is burned for fuel. It has compound con-



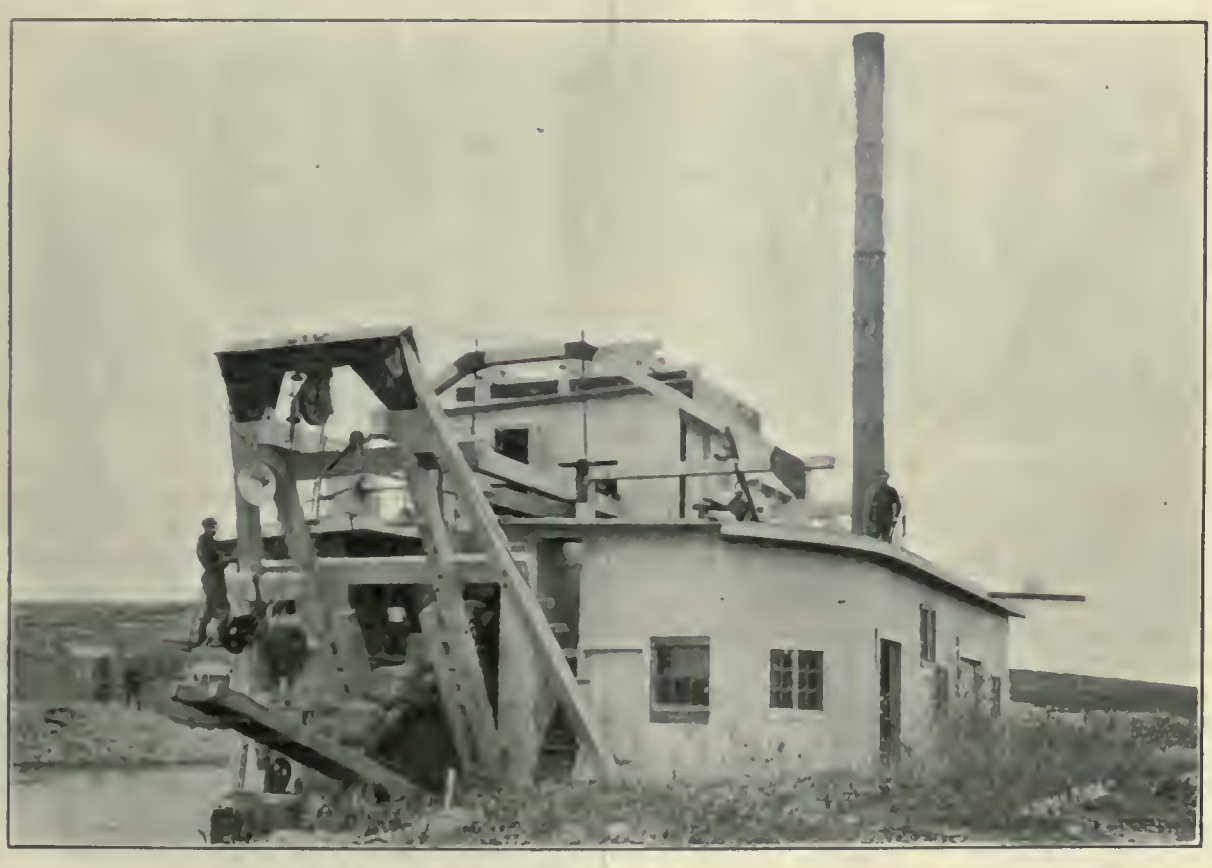
Seward Peninsula.

placed on Solomon river, one on Cripple, one on Sinrock, and one on Kougarok.

Of the dredges constructed this season, the Sionx-Alaska Mining Company's boat built on Moss gulch, a tributary of Nome river, was the first to begin operation, and had a sixty-day run. The dredge has a 2½-ft. open-connected bucket line, revolving screen, and belt stacker. It is driven by gasoline power. A 50-hp. engine drives the bucket line, screen, winches, and stacker, and a 35-hp. engine drives the pump. It was designed by the Northern Construction Co. and built at the Union Iron Works, San Francisco. The company was financed in South Dakota, H. G. Solem of Baltic being president, H. O. Smith of Dell Rapids being treasurer, and Collin Murray of Nome and Seattle, manager. Mr. Murray states that they are well satisfied with the showing

densing engines, and a water-tube boiler. It has no spuds, and digs on head lines entirely. They had the misfortune to break one of the low-pressure columns at the beginning of operations, and it could not be repaired until certain parts were shipped here from San Francisco. These were not received until the last boat, so that they have operated on less power than was designed for the dredge, and as a consequence have been unable to work up to the normal capacity. The machine was designed to dig 2000 cu. yd. per day, but in its crippled condition could only wash an average of 1300 cu. yd., and the men in charge have been compelled to adjust the digging apparatus to the washing capacity. The broken cylinder will be repaired before the season opens next spring, and long-continued prosperity is anticipated for this enterprise. The dredge was

Arctic Gold Dredging Co.'s Dredge, Saunders Creek, Nome District.
(Built by Union Iron Works.)



Flodin Gold Mining Co.'s Dredge No. 1, September 21, 1910, Nome District.
(Built by Risdon Iron Works.)

built by the Risdon Iron Works of San Francisco, and installed under the able supervision of Gerald Hutton, the Alaska representative of this firm.

The Arctic Gold Dredging Co. has installed a dredge during the past season on Saunders creek, about ten miles east of Nome. It was designed by W. W. Johnson and built at the Union Iron Works of San Francisco. It has a 2½-ft. open-connected bucket line, revolving screen, and belt stacker. It is driven by gasoline engines, having a 50-hp. en-

gine which drives the bucket line, winches, screen, and stacker, and a 35-hp. engine to run the pump. There is also a small boiler which is used to supply a steam-heating plant. By placing light housing over the stacker and over the bucket line down to the water-level, and a return steam-pipe on each side of the bucket and stacker ladders, the operators are able to prevent ice from forming on the belt and bucket lines, when the temperature is much below freezing point. By the use of this plant, they hope to be able to run considerably later in the fall than the weather conditions would otherwise permit. This company has its headquarters in Wichita, Kansas, and was financed by Kansas and Nebraska capitalists. The dredge was shipped here last spring to be installed on Arctic creek, a tributary of Cripple river, 15 miles west of Nome, but a more careful examination of the area upon which it was to be installed convinced Frank Middaugh, the manager, that the ground was not as well suited for dredging as had been supposed. He immediately secured several claims on Saunders and Grass creeks, and changed the destination of the machinery from the mouth of Cripple river to the mouth of Hastings creek, into which Saunders creek flows. By exerting the utmost energy, he had his dredge built and running by the end of the first week in September. He closed on October 15 to catch the last boat out. Upon being interviewed, he said all were well pleased with the showing made this season. In the five weeks the dredge had been operated, enough had been made above operating expenses to cover the cost of freighting the plant to the ground and building it, and the owners look forward to a long and successful career. A. E. Helm of Wichita, Kansas, is president, and F. E. Braucht secretary-treasurer of the company.

Another dredge is being installed on Saunders creek by the Saunders Dredging Co., of which Andy Anderson of Nome is the president and manager, and J. J. Cole treasurer. The dredge has a 3½-ft. close-connected bucket line, revolving screen, and belt stacker. It is driven by gasoline engines and is equipped with one 80-hp., one 25-hp., and one 10-hp. Metz & Weiss engine. It was designed and built by The Bucyrus Co., and was shipped here to be installed on the Casadepaga river, but the company became involved in financial difficulties, and was unable to proceed with the enterprise. A new company was then organized among local capitalists, and the dredge machinery purchased from the Casadepaga company, and it is now being rapidly erected on lower Saunders creek. It will be ready to operate by the time the frost is out of the ground in the spring, and, as it is well known to have a large area of rich ground in which to work, there is no doubt of its success.

Sivertsen & Johnson, who made such a signal success last season operating a small gasoline-driven dredge, on Solomon river, have this season installed a new one in the same area. This dredge has a 2½-ft. open-connected bucket line, revolving screen, and pan stacker. It is driven by steam power, and coal is used for fuel. It was completed in the early part of September, and has had about a six weeks' run up to the time of writing. It has operated in ground from eight to twelve feet deep, with a rough limestone bedrock, and has averaged about 1500 cu. yd. per day. The exact amount of the output has not been obtainable for publication, but it is well known that this area contains some of the richest gold-bearing ground on the Solomon river, and it is certain that the clean-ups amounted to many thousands of dollars per week. The dredge was built by the Risdon Iron Works, and installed by Gerald Hutton.

The Flodin Mining & Dredging Co. of Chicago has built a dredge of the same size and design as the Sivertsen & Johnson dredge, near the mouth of Big Hurrah creek, on the Solomon river. This dredge, the Plein dredge near Nome, and the Sivertsen & Johnson dredge were under construction at the same time and were launched on the same day. They are all of the standard Risdon type, with some modifications to meet local conditions. The work of assembling the machinery and constructing each of these dredges was under the supervision of Gerald Hutton, and this energetic engineer has shown marked ability in accomplishing a big task, under many difficulties, to the entire satisfaction of all concerned. This dredge is credited with having mined $60,000 in the six weeks it has operated, and while I cannot vouch for the truth of this statement, it is working in a rich area, and an output of $10,000 per week from a dredge handling an average of 1500 cu. yd. per day should not cause surprise. Claes Flodin of Chicago is president and manager of the company, and Benjamin Flodin is secretary.

On the upper Solomon river near the confluence of the East Fork and Solomon, another dredge has been constructed this season. It was built by The Bucyrus Co. for the Solomon Dredging Co. which was financed at San Francisco, and is managed by Frank I. Reid of Nome. P. R. Parker, Pacific Coast engineer for The Bucyrus Co., was in charge of its construction. This is said to be one of the best constructed and equipped dredging machines yet built in the North. Its hull is 80 by 45 ft. and 7 ft. deep. It is equipped with a 150-hp. Mosher water-tube boiler, and crude oil is used for fuel. Its main engine is a Ball 90-hp. compound condensing engine, arranged to run tandem. This drives the bucket line, screen, and stacker. The pumps are driven by a 60-hp. compound condensing engine. The bucket line contains 62 close-connected buckets of 3½-ft. capacity, and at normal speed, 20 of these are delivered per minute. The screen is of the revolving type, 60 inches in diameter and 25 ft. long. The perforations are graduated from ⅜ to 1½ inches. An 8-in. centrifugal pump delivers water to the screen sprayer, and a 4-in. auxiliary pump sprays the buckets as they dump into the hopper, and supplies additional water to the gold-saving tables. Its tailing conveyer is of the belt type, usual to Bucyrus machines. It is lighted by a 6-kw. dynamo carrying 100 lamps, and is equipped with a steam-heating plant to prevent the stacker and bucket line from freezing as the cold weather comes on in the fall. Owing to delays in delivery of material, and to the substantial manner in which this

dredge has been built, it has required practically the whole season to assemble and complete the dredge. It was finished and began operations October 14, and is now in full swing. Mr. Reid informed me that he hoped to get in a thirty-day run before the cold weather compelled him to close for the winter.

The Alaska Gold Dredging Co., which built two dredges in the Council district last year, has this year erected another on Willow creek, a tributary of the Casadepaga river. It is a 2½-ft. open-connected dredge, driven by two gasoline engines of 40 and 25 hp. respectively. It has a revolving screen and belt stacker. It was completed late in September and was run long enough to prove its efficiency in handling the rich Willow creek gravel. This is the fourth dredge built on Seward Peninsula through the efforts of the old pioneer, Jerry Wilson, who is president and manager of the Alaska Gold Dredging Co., and, while it is not definitely known that he will do so, it will not surprise the old-timers here if he should bring another with him next spring. Kimball & Saupe have constructed a small dredge on Melsing creek, near Council city, during the past season, and have had a successful run of nearly 60 days, handling about 1000 cu. yd. per day. Melsing creek is a type of many streams on Seward Peninsula which offer big returns on a comparatively small investment in a dredging enterprise. The gold-bearing gravels are from 5 to 15 ft. deep, lying for the most part on decomposed schist, or else on shattered and broken limestone, or, in some cases, on a false bedding of sandy silt or clay. There are no large boulders and the gravel is for the most part well washed, and comparatively free from clay or sticky material. The gold is coarse and easily saved, and the tenor is from 40c. to $1.50 per cu. yd. The banks of these streams are frequently in the grip of permanent frost, and are not dredgeable, but the beds of the streams over which the water flows are almost invariably thawed, especially if the stream carries a considerable volume of water. Many of these streams have been worked by the pick and shovel method, but as the miners can make only wages, and sometimes not even that, most of the stream beds in this class still remain to be turned to profitable account by other methods. There are innumerable opportunities here for the investment of from $15,000 to $50,000 in enterprises that, if intelligently managed, will give profitable returns on the investment. This class of property is not held at high prices, and in many cases the owners would be glad to put up a large tract of ground as an offset against a small but substantial dredge, and divide the profits over working costs.

Wild Goose M. & T. Co.'s Dredge. Began Operations September 26, 1910.
(Built by Yuba Construction Co.)

Among the many dredges installed on the Peninsula this season, none is more substantial or better equipped for work than the one built for the Wild Goose Mining & Trading Co. on upper Ophir creek, in the Council district. It was built by the Yuba Construction Co. of Marysville, California, and embodies all of the best features of this company's standard designs, together with such additions and improvements as could be suggested by C. H. Munro, manager for the Wild Goose company, who is himself not only an expert dredge superintendent but a constructing engineer of ability. His experience in this district has thoroughly equipped him to handle the

problems which local conditions present. The dredge has a close-connected bucket line, carrying 58 buckets with a capacity of 3½ cu. ft. each. The hull is 75 by 37½ ft. and 6 ft. deep. It has a revolving screen 60 in. diam., 25 ft. long. The perforations are graduated from ⅜ to 1 inch. The tailing is handled by a Robins conveying belt of the best quality. The power is supplied by a standard gasoline engine of 125 hp. Water is furnished by a 10-in. centrifugal pump having a rated capacity of 2800 gallons per minute. The port spud is of Washington fir, while the digging spud is of angle steel and weighs four and one-half tons. A steam-heating plant maintains a comfortable temperature aboard the boat, and steam lines on the stacker ladder prevent ice from forming on the belt when the chilly winds begin to be felt in the fall. The boat is lighted throughout by electricity, generated by a dynamo aboard ship. No expense has been spared to make this dredge a perfect digging machine and first-class gold saver. Its capacity is 2000 cu. yd. per day. The Wild Goose company owns a number of contiguous claims on upper Ophir creek, and it is certain that this dredge will add its full quota to the general output for many years to come. It was finished in the early part of October, and was run about ten days with entire satisfaction to all. Owing to the high cost of cordwood and the excessive freight charges on coal and crude oil delivered to Ophir creek, Mr. Munro chose a gasoline engine as the most economical power developer under the prevailing conditions. The Blue Goose company's dredge, the pioneer dredge of Ophir creek, under the capable management of Gilbert Russell, has had a fairly successful season, though much delayed in the early part of the summer by the winter frost. Its capacity is about 1000 cu. yd. per day. It is driven by steam power. Wood is used for fuel and costs $10 per cord. It requires an operating force of nine men. Its gross output this season was $55,000, of which about one-half is profit.

The small dredge on No. 24 Ophir owned by Charles Kimball has run steadily all summer, and Mr. Kimball reports a very profitable season.

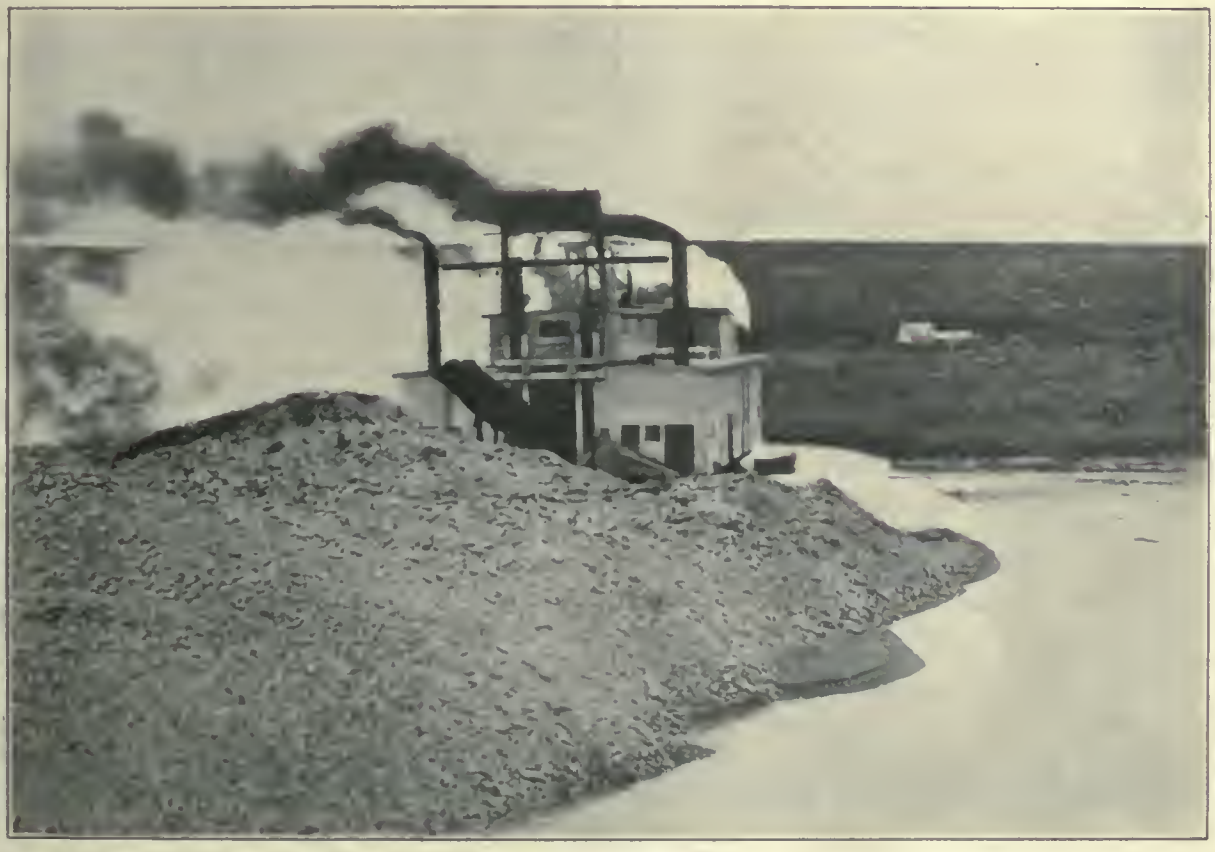
The Alaska Gold Dredging Co.'s two dredges on Gold Bottom and Warm creeks near Council have had to face extraordinary difficulties this season, and have not met with as much success as was anticipated. These two dredges were built at the confluence of Gold Bottom and Warm creeks and were but a short distance apart, when closed last season. During the winter an ice sheet formed over a large area in the beds of the streams about and in the vicinity of the dredges, and by continued overflow and constant accumulation, a bed of ice many feet thick was formed. The season opened late and the weather continued chilly and inclement until midsummer, and while this ice mantle slowly melted away, it kept the warm air from reaching the frozen gravel underneath, and was a serious obstacle for the larger part of the season. The formation of such an ice sheet over this area is unusual and was entirely unexpected. It may not occur again for many years. I am informed that the yardage handled this season was about half what was expected, though the output was encouraging, all things considered.

The Three Friends dredge and the Pearson dredge on Solomon river, both of which have made a splendid showing in the past, were much delayed by the late season this year. The Three Friends dredge shipped in a new Bucyrus bucket line on the first fleet of boats, and the Pearson dredge shipped a modern water-tube boiler. Ice along the shore prevented the ships from landing this machinery at Solomon for many days after they reached the roadstead off Nome. The Pearson dredge was finally made ready to start on June 23, eighteen days later than it started last year, and the Three Friends did not get under way until July 6, thus giving about a 100-day season. These two dredges, although under entirely different ownership, have operated for the last three seasons near each other, handling river gravel and the top foot or so of bedrock, and working at depths ranging between eight and fifteen feet. They are driven by steam power, and burn coal for fuel. Coal costs $20 per ton laid down by the railroad, to which must be added about $1 per ton for wagon haul to the boats. The Pearson dredge is a 5-ft. open-connected machine of the Risdon type, and handles an average of 2000 cu. yd. per day, with an average fuel consumption of 4½ tons of coal. It is equipped with compound condensing engines and water-tube boiler.* The Three Friends dredge is a 5-ft. close-connected machine of the Bucyrus type, patterned after the best models of six years ago in all features, except the power. It has ordinary flue boilers, and plain slide-valve engines, exhausting into the open air. Its fuel consumption averages 14½ tons of coal per day, and though it has a record of handling 3000 cu. yd. per day for a 120-day run three years ago, it has averaged only about 2000 cu. yd. per day during the last two seasons. When this dredge was built in 1905 it was the intention of the company to install electric power on the boat in 1906, but litigation over water rights and other causes have prevented them from carrying out their plans, and they have operated from year to year with the old make-shift boiler and engine. A. J. Condee, the present manager, states that they have had an excessive fuel cost of over $20,000 per annum for five years. To save this loss and to supply power for two more dredges which they are now planning to build, the company will, next year, erect an electric plant on the beach near the mouth of Solomon river. The electricity will be generated by steam power, and crude oil will be used for fuel. Crude oil can be delivered into a tank on the beach at a cost not to exceed $2 per barrel, which is equivalent to coal at $7 per ton. The electric plant as now planned, will cost $70,000 when ready to run, but it is the intention to supply power to other

*Later advices state that this dredge continued in operation till November 13 and took out $15,000 this year after most of the other dredges had stopped. Last year the Pearson, or Nome-Montana-New Mexico dredge, stopped October 27. The operating season in 1910 was the longest since dredging began on the Seward Peninsula.

dredges on Solomon river, if suitable contracts can be made, and in this case additional units will be placed in the power-house to meet the requirements. Mr. Condee says he can supply electric power at a cost of $7.50 per horse-power per month, whereas at the present time those most favorably situated and best equipped are paying about $30 for the same power. It speaks well for Solomon river as a dredging area that it will bear such excessive and wasteful charges and yet pay dividends to the operators. There are now six dredges on the Solomon river, five of which have steam power, and one gasoline. At least two more dredges will be installed in this area in the near future, and they are to be designed larger than any now in the field. Taking the average power consumption at 100 hp. for each machine, and the average saving as outlined above at $23.50 per horse-power per month, or $2350 for each dredge, by uniting their forces, and erecting a central power-plant, these companies can pay for such a plant, together with the cost of changing to motors on the boats, in two seasons, from money which is now being absolutely wasted as far as the dredging industry is concerned.

The Wonder Creek dredge, near Nome, is still at work and has had a season of a little more than four months. It is digging in ground about fifty feet deep, and a mantle of frost at the surface is not a serious hindrance. Consequently, operations can be begun here earlier in the spring than at dredges in shallow ground. The *Mining and Scientific Press* in its issue of July 9, 1910, under the head of 'Special Correspondence' from Alaska, is made to say that this dredge and the Bourbon dredge have installed thawing plants with which the ground can be thawed to a depth of 60 ft., at a cost of 8c. per cu. yd. of material handled, and that the two dredges are handling nearly 6000 cu. yd. per day. I wish to correct this statement, as it appears ridiculous to those who are familiar with the handling of frozen ground, and with the conditions under which these dredges operate. Neither of these dredges is equipped with a thawing plant, nor has there yet been devised any method by which ground may be economically thawed to a depth of 60 ft., nor is there any method known by which frozen ground at any depth may be thawed at as low a cost as 8c. per cubic yard. With coal at $20 per ton and crude oil at $3 per barrel, it is safe to say that no frozen ground has yet been thawed in this district at a less cost than 50c. per cubic yard.



Three Friends Dredge.

(Built by Western Engineering & Construction Co. Complete Equipment Furnished by The Bucyrus Co.)

It is quite possible that with an economical boiler of about 120 hp., mounted so it could be easily and cheaply moved, burning crude oil and supplying a battery of 100 points, a gravel bed from 8 to 12 ft. deep could be thawed at a cost of 25c. per cubic yard in the vicinity of Nome. In such a case a carpet of tundra from 2 to 6 or 7 ft. thick overlying the gravel would not be detrimental, but rather advantageous, as it would serve to prevent surface radiation and consequent loss of heat. The extra length of points required would not make them much more difficult to drive, as a steaming point sinks readily by its own weight in the tundra surface, and the driving head would be within easy reach when the point hit the gravel. This surface layer need not be thawed, but could be undermined by the dredge, and then broken down in blocks of considerable size, and floated and

rolled back into the pond. There are a few frozen areas on Seward Peninsula where the required conditions as above described are found, and there may yet be successful efforts made to dredge them. So far, however, all dredging has been, and is being, done in thawed ground, though a rib of frost is sometimes found and must be cut through. In such a case the wear on bucket lips and pins is severe and dredge masters will grapple with it only when absolutely necessary.

The Wonder dredge has averaged about 2000 cu. yd. per day, and though I do not know the amount of the clean-up, I understand it has been highly satisfactory. The Dexter creek dredge mentioned as being under construction in the special correspondence to which I have above referred, has its existence only in the imagination of the writer, as no such dredge is being built, nor has it ever been started. The Bourbon creek dredge, the control of which passed into the hands of Col. Stuart-Weatherly, last winter, has had its usual season of bad luck this summer. The Colonel was fortunate in securing the services of Frank N. Wood, who made such an enviable record on the Three Friends dredge during its first five years of operation, to act as his superintendent. After a thorough overhauling, Mr. Wood got the big machine under way about July 20. By the most watchful attention he has managed to keep it digging nearly all of the time until he laid it up for the winter, about October 1. It has not been a success and it may never start again until it has been rebuilt into a better dredge and placed upon ground suited for dredging and containing sufficient gold to give reasonable returns. I am reliably informed that a run of 17,000 cu. yd. averaged only 4c. per yard, and another run representing about twice this yardage returned 12c. per yard. These values are entirely too low to pay to work in this district. This dredge is situated near the mouth of Bourbon creek, almost on the edge of tide-water. The valley in which the creek flows is a shallow depression in the tundra and the stream is small, not even affording water to float the dredge in dry weather. There has been but little re-concentration due to the creek, and the gold found there is only such as may be found anywhere over thousands of acres of the tundra plain in the immediate vicinity of Nome. Colonel Stuart-Weatherly frankly says that the drill records made by his grantors were utterly unreliable, that he has been deceived, and is much disappointed. It is another exemplification of the danger of trusting to the trader to tell you the age of his horse. One must look at his teeth and be able to judge for himself.

Away back in the early days of Nome's history, E. E. Powell, then of Portland, but more lately of New York, came here with a small gasoline engine, a chain of buckets, each of which resembled an ordinary water pail, bolted to a sprocket chain, a few sprocket wheels, bolts, belting, and a wagon-load of timber. Bourbon creek, being near town and not overcrowded with miners, offered an inviting locality for Mr. Powell's experiment. Being a keen trader, he was soon in possession of one or two claims, and in a short time had erected a sort of vest-pocket dredge on wheels. He and another man worked the machine from the time it was finished until the end of the season, and his tailing pile was so much bigger than two men could have shoveled in the same time, that, taken together with his exceptional conversational powers, he easily impressed the owners of claims up the stream with the important part machinery was going to play in the future prosperity of the camp, and particularly in low-grade gravels like Bourbon creek, and that he was well equipped to handle just such ground. He secured control of several claims along the creek and the following season came in with two more of these small aggregations of machinery. These were erected at points higher up the stream and he began to feel that Bourbon creek was his particular cabbage patch. With this idea in mind he organized the Anvil Hydraulic & Drainage Co. and proposed to dig a drain ditch from sea-level at the mouth of Bourbon creek to the foot of Anvil mountain some three miles away. To accomplish this, it was necessary to get control of a block of ground from the foothills to the sea. He laid his scheme before the claim owners in his most persuasive manner, and before long he had the route for his drain pretty well secured; some of the claim owners had stock, some had 'gold bonds' issued by his company, bearing 8% interest, and some had money, but Mr. Powell had the ground. The following year he came in with a much more pretentious machine. It was big enough at the base to put a kind of pilot-house on it as a second story without danger of becoming topheavy. He installed this machine a short distance from the mouth of the creek and began to dig his proposed drain, which was to be fifty or more feet deep through two miles of its length. His last machine was so far superior to the others, that he abandoned them as instruments that had outlived their usefulness, and they stand today where he left them as monuments of his enterprise. About this time he became intimately associated with William Tecumseh Perkins, who had had considerable training as a promoter under the tutelage of John Rosene of the Northeast Siberia company and Northwest Development Co. It was not long before Mr. Perkins and Mr. Powell had formulated a plan for a big company flotation which seems to have been eminently successful. Mr. Powell's connections had been in the West, but Mr. Perkins was in touch with the East. The Nome Mining Co. was formed to lease the holdings of the Anvil Hydraulic & Drainage Co. and the opportunities for profit-taking were painted in such beautiful colors that they readily placed enough Nome Mining Co. stock to enable them to build an electric-power plant at a cost of $150,000, and a dredge at a cost of $97,500, and to enable Mr. Powell and Mr. Perkins to each have his own automobile. Pursuant to the plan originally made, the Nome Mining Co. was given a lease for a term of years on the Bourbon creek holdings of the Anvil Hydraulic & Drainage Co. at a royalty of 25% of the gross output, and an option to purchase at $1,750,000. The construction of the Nome Mining Co. dredge, commonly called

the Bourbon dredge and power plant, was begun in the summer of 1907 and completed in the summer of 1908. The dredge was built by contract, and the design was drawn by the contractor. There was neither a technical engineer nor a practical dredgeman to draw the specifications, nor inspect the machine as the work progressed. The result was what might have been expected, a mass of heavy machinery without balance or a proper regard for the interdependence of its various parts, and it has given trouble from the start. More than $65,000 has since been expended in changes, additions, and improvements, but it is still only a makeshift affair. Mr. Powell, although abandoning his big drain ditch scheme on the birth of the Nome Mining Co., has not been identified with the active management of the latter company since the dredge and power plant were completed. The Eastern stockholders were given the privilege of subscribing for considerably more than half of the shares issued by the company, and they have been in control. After two years of unsuccessful effort under two different managers, and the expenditure the first year of $25,000, and the second year of $40,000, in changes and improvements on the dredge, the Nome Mining Co. last winter sold to Colonel Lionel Stuart-Weatherly 54% of its stock for $200,000, of which $65,000 was paid in cash and the remaining $135,000 was to be paid from a percentage of the gross output within a fixed period. The Colonel was elected president of the company and given entire control. From remarks made by the Colonel during the latter part of the season about having been 'fleeced' and 'bunkoed,' it is presumed he will sever his connection with the enterprise in the near future. The Colonel has other and extensive holdings here, however, and is by no means discouraged.

The Gold Beach Dredging Co., which last year installed a 5-ft. open-connected dredge near the mouth of Dry creek on the outskirts of Nome, has come to grief. This concern was promoted by one Roy Braucht with headquarters at Fremont, Nebraska. It was capitalized at $1,000,000, and a prospectus containing most extravagant statements was published and circulated. A sufficient amount of stock was sold to enable them to buy a dredge, which had been built by I. B. Hammond of Portland for a company in Oregon, but which had never been started, owing to insurmountable difficulties encountered by the company. It was dismantled by the Gold Beach Dredging Co. and shipped to Nome in the spring of 1909. The company leased claim No. 14 Below on Dry creek, agreeing to pay 25% of the gross output as royalty to the owner. The dredge was built and ready to run by September 20. Up to this time no effort whatever had been made by the dredge company to prospect the ground and it was relying upon general rumor as to the gold tenor of the gravel and its suitability for dredging purposes. Getting the dredge under way, they soon discovered that with the exception of a narrow, tortuous course under the bed of the stream, the ground was permanently frozen and dredging impossible. Nothing daunted, however, they closed the gates in their dam and flooded five or six acres to a depth of six or more feet, under the fond delusion that the water would draw the frost from the ground. They laid the dredge up for the winter, went out on the last boat, called a meeting of the stockholders, and after a glowing report on the success of the enterprise, the directors proceeded to declare a 10% dividend. Immediately following this enthusiastic gathering, Gold Beach stock was again offered to the public at 30c. on the dollar, and boosted, as sales were made, until it reached 65 or 70c. The advertised purpose of this issue was to secure funds to buy another dredge, and many Nebraska, Iowa, and Kansas people jumped at the chance to get in on an investment away under par that had paid 10% the first year of its existence and promised a magnificent increase in the immediate future. As the funds came in an order was placed for a 3½-ft. dredge. The company did not then, nor does it now, own an acre of mining ground in Alaska, nor did those in control know where they would place the dredge when they got it here. In the meantime, this sleek young promoter, R. Braucht, was selling blocks of his personal stock, at a little under the market, whenever opportunity offered, and this finally led to his undoing. He had bargained with a banker in Iowa to take 40,000 shares of his stock for a lump sum of $20,000, and when he made the final plunge on the new dredge, he reckoned confidently on this $20,000 being available for his use, if the funds in the company's treasury were insufficient to meet all demands. Another one of the insiders, learning of this transaction, visited the banker and offered to deliver a similar number of the company's shares for $17,000. The banker, as usual, being on the alert to make a thousand or so, promptly accepted the offer and the stock was delivered. When the time agreed upon for the conclusion of the deal with Mr. Braucht had arrived and the banker was called upon, he gleefully told Mr. Braucht of the lucky deal he had made, and that the proposed deal with him must be declared off. The $17,000 was diverted into other channels, and Mr. Braucht was compelled to start for Alaska with his new dredge held for the freight charges, though he consoled himself with the thought that he was bringing with him the best automobile that had ever been shipped to Nome, in which he would daily ride out three blocks from the centre of town to watch his Dry creek dredge turn out the money from the area he had so wisely flooded last fall. He had no doubt he would soon have money from this source to pay freight bills and install his new machine, when he found some place to put it. The frost was not drawn, however, nor could he make a success of drawing it with steam points. After much effort and a failure to meet current obligations, he was compelled to abandon the attempt, and the owner of the ground gave him notice to take his machine off the claim, as his lease was forfeited. Being unable to redeem his new dredge from the transportation company, he has turned it over to the Saunders Dredging Co., which was organized by local people to work on Saunders creek.

Colorado Mineral Production

By Theo. F. Van Wagenen

Colorado mining men, as well as all who have the welfare of the State at heart, have been much exercised during the latter part of 1910 over the reported decline of its mining industry. The Denver papers during November published the statement that the annual production of the mines had decreased in value from fifty to thirty millions in the last nine years—a loss of 40%—and gave Franklin Guiterman of the A. S. & R. Co. as their authority. The matter was then taken up by the Colorado Scientific Society, and the Colorado Chapter of the American Mining Congress, both accepting the figures attributed to Mr. Guiterman, which, in fact, have neither been repudiated nor amended by that gentleman. The year closed, therefore, somewhat gloomily among the real estate people in the valley

Mineral Districts of Colorado.

cities, for in spite of the evident prosperity among the farmers, stockmen, and manufacturers, it is recognized that any serious or progressive falling off in the value of the output of the mines, unless soon checked by new discoveries, will surely injure their business. Up to date I have seen no detailed verification of the depressing figures given out by Mr. Guiterman, nor any attempt to discuss the elements of the situation. It seems fitting, therefore, to take the matter up in this review. There is nothing to be gained by concealing the facts, and there may be a decided advantage in facing them. Hence the two following tables representing the metallic output of the mines of Colorado for the last fourteen years have been prepared. The figures have been carefully abstracted from the 'Mineral Industry', except those of 1909, which are the advance estimates of the U. S. Geological Survey. To a considerable extent they confirm the statement attributed to Mr. Guiterman, but not some of the inferences that have been drawn from them. The decrease

TABLE I

VALUE OF MINERAL PRODUCTION 1897 TO 1909

in value of output from the product of the year 1900 to that of 1909 is under 33% instead of nearly 40%. However, it will have to be admitted that the correct figure is quite bad enough, unless some mitigating or compensating circumstances can be shown. This I will endeavor to do, with what success the reader can decide.

Table I deals wholly with money values, while Table II is entirely a matter of weights. The one will supplement the other. The first displays the fact that during the fourteen years under consideration the output has fluctuated in value very remarkably at times. If, for instance, we compare the figures of 1909 with those of 1897, the difference is only about 7%. And when it is noted that during the earlier period the miner was selling his silver for 59.8c. per fine ounce as against 51.5c. during the later (a difference of 14%), it will be evident where the trouble was. Again, if the business of 1903 is compared with that of 1900, it will appear that in the three years following the latter date the annual output fell off 30%, or nearly as much as in the nine-year period on which Mr. Guiterman's figures were based. But comparisons of this kind yield little comfort. The total output has declined heavily in value, no matter from what angle it is viewed. A study of the figures of Table II is necessary in order to see just where the trouble has been.

TABLE II

PRODUCTION OF METALS BY WEIGHT

1909	1,079,909	51.5	9,168,516	13.0	12,129,500	4.3	31,104	5.5	19,794
Average	1,142,402		16,313,024		10,083,655		52,823		16,397

Gold.—The average annual output of the 14-year period under consideration has been 1,142,402 fine ounces, that of 1909 being 1,079,909. Here is a decline of but a little more than 5% in the period, and the figures of 1903 and 1907 are both less than those of 1909. As Cripple Creek is the main standby of the State in the matter of gold production, it will be natural to look there for an explanation of the decrease. It is known that the production at Cripple Creek has varied much on account of water difficulties, especially during the last four years. The camp, none the less, makes a fine showing in the face of this difficulty. Now that the deep drainage tunnel has at last reached the ore-bearing formation, all such troubles may be dismissed for the next ten years or more. The figures for 1910 are already known to show a considerable improvement upon those of 1909, and it seems probable that the record for 1911 will approach that of the best year of the great camp. Any worry over the gold output is unnecessary.

Silver.—Here the conditions and prospects are very different, and by no means encouraging. It will have to be admitted at once that the outlook for the white metal in Colorado is bad. The production of 1909 was below the average of the 14-year period by more than 45%, and while the improved value of the metal now current promises to result in greater value of the product during 1910 and 1911, yet a return to the tonnage figures of 1898, or anything like them, cannot fairly be expected. In 1906, when silver was worth nearly 67c. per ounce, as against nearly 60c. in 1897-9, the output was declining. The fact is that the silver production is closely connected with the lead product, and to a large extent with that of the oxidized lead minerals. The known resources in the latter have become extensively exhausted, and no explored and developed district in the State promises any notable revival in the yield of that class of mineral. Unless some surprises are awaiting the operators in the new western slope mineral belt which is slowly but surely being developed, it will probably have to be admitted that Colorado has passed her prime as a silver-producing region.

Copper.—Here operators are justified in feeling much encouraged. The copper output for 1909 was well in advance of the average of the 14-year period tabulated, in spite of the low price of the commodity. There are no indications yet that the State will develop mines of the red metal comparable to those of Arizona, Montana, Utah, or Nevada; but there is every probability that the product will never again fall below the average of the table. This is because of the stability of the industry in the two great fissure-vein localities of the State, Gilpin and Clear Creek counties in the Front Range, and the San Juan mountains in the southwest. In these parts Colorado stands on edge, so to speak, and deep mining, with iron and copper pyrite as the principal minerals, has become established. The first two counties named have been steady and re-

liable producers for the last fifty years, and the other district for more than thirty.

Lead.—In this item the decline has been serious since 1900, and looking around among the known districts of the State it is not possible to find warrant for hope of return to the figures of the past. The known oxidized orebodies of Leadville, Red Cliff, Kokomo, White Pine, Creede, Monarch, and Alma are practically gone, and no new localities of a similar nature have been discovered. Colorado will always be a considerable producer of the metal from its silver fissure-vein districts, such as Georgetown, Montezuma, Breckenridge, Lake City, Silverton, and Ouray, but from them it comes in comparatively small quantities, and the amount varies directly with the price of silver. There are still some chances of new discoveries at Leadville. The limits of that wonderful camp are not yet entirely known. When the long-contemplated Malta drainage tunnel is undertaken (as it ultimately will be), there are several large areas that are not unlikely to be found to contain extensive bodies of carbonates. In that great region of contorted and altered sedimentaries at the head of the White river, which has been neglected for so many years by the prospector, there is much promise for the discovery of argentiferous lead ores. And there is still another region of the same kind (geologically) in the extreme northwestern part of the State. All this new territory is being made accessible by the building of the Moffat road, now at Steamboat Springs, a branch from which will surely, sooner or later, be pushed to Meeker.

Zinc.—The figures indicate the beginning of a very important branch of our mining industry. It is already well known that the production of 1910 will be well in advance of that of the previous year, while the prospects for 1911 are particularly bright.

Other Metals.—Colorado is a variable producer of tungsten, manganese, uranium, vanadium, and bismuth. The outlook for tungsten is particularly good. It is probable that manganese production has seen its best days, at least until some new discoveries are made by prospectors. The output of the rare metals may be expected to be spasmodic, but there are indications that the State's resources in uranium and vanadium are fairly large, and will cut quite a figure when the western mineral belt becomes better known. Taken all together, there is no call for any feeling of depression over the condition of the mining industry in Colorado. There are enormous known bodies of low-grade sulphide ore at Leadville, Red Cliff, Kokomo, Robinson, and elsewhere, that cannot at present be handled economically by the smelters, because of the scarcity of silicious ores to work with them, and this scarcity has resulted mainly from the expansion of the milling industry at Cripple Creek. If new resources in dry ores are not soon discovered in the State, or made available from adjoining or nearby localities, it is not unlikely that the A. S. & R. Co. will begin a serious study of the problem of developing a method of ore reduction not so much dependent upon heat and fusion as that now in vogue.

Eleventh International Geological Congress

By James F. Kemp

The plan of an International Geological Congress had its inception in the American Association for the Advancement of Science and took form in the appointment of a committee at the Buffalo meeting in 1876. Subsequent correspondence brought a sympathetic response from those countries that are especially interested in the science and led to the first session in Paris, in connection with the Exposition of 1878. It was a simple affair compared with the congresses of later days, and was chiefly taken up with papers and discussions. French was selected as the official language and the organization was perfected and made permanent. The second meeting was held in Bologna in 1881, and since then there have followed in order, Berlin, 1885; London, 1888; Washington, 1891; St. Petersburg, 1894; Geneva, 1897; Paris a second time, so as to coincide with the exposition of 1900; Vienna, 1903; Mexico, 1906; and finally the eleventh session, held at Stockholm, Sweden, in August of 1910.

Beginning more particularly with the Washington congress, excursions to places of especial scientific interest became a feature, and as time passed the preparations for the excursions grew more elaborate. Guide books of increasing merit were written and visiting geologists were enabled to see in the most intelligent way the country where the session was held. Governmental aid has been extended when this was possible, and expenses of travel have been kept within reasonable limits. In Mexico and lately in Sweden excursions were planned so as to be of particular interest to the mining fraternity. In 1906 the delegates had the opportunity of visiting, for example, Pachuca, Guanajuato, Zacatecas, Parral, Concepcion del Oro, Mazapil, the Esperanzas coal basin, and the Ebano oilfield. The past summer there were eight excursions before the congress, and eight after it, two of which were specially planned for the iron mining regions of Sweden.

In the earlier sessions the Congress took up a number of matters of interest to all the participants. For example, a standard series of colors for geological maps was discussed before and at the Berlin congress of 1885. A report was submitted and a series proposed. Americans were soon after given a sample of the ones chosen, because they were used on the geological map of the United States prepared by C. H. Hitchcock and printed in the *Trans.* of the Amer. Inst. of Min. Eng., Vol. XV, 465, 1887. As soon as one studies Mr. Hitchcock's map it is clear that the two browns selected for the Cambrian and Devonian systems are too nearly alike. The United States Geological Survey therefore, after careful consideration, adopted a different set from that of the Congress, as is duly set forth in the Tenth Annual Report, p. 71. Practically this set continues in use. At one of the earlier congresses the preparation of a geological map of Europe was authorized. The map has been

appearing in parts and is now almost completed. It affords a fine portrayal of the European continent on a fairly large scale and is of invalnable aid to teachers.

For the Mexican Congress in 1906, a map of North America was prepared by the joint action of the Canadian, American, and Mexican surveys. The map was edited in Washington and printed in Baltimore. It is a beautiful example of modern cartography. While Canada and Mexico are fully colored, unsightly white areas were left upon the American portion in the Great Basin region, leaving a most unfortunate impression upon an observer. One involuntarily feels that after years and years of work and vast expenditure, American geologists knew less about their country than the Canadians do of Canada, or the Mexicans of Mexico. And yet as compared with Canada, the area is no greater, the accessibility is much superior, and the workers are far more numerous. In early Congresses the endeavor was made to correlate geological names, except of course for the smaller divisions, but this plan has never been successful beyond the Periods. So far as the pre-Cambrian rocks are concerned, we are in the worst confusion of all. Much discussion was held upon this topic in Sweden—but the only term of general application for both sides of the Atlantic is pre-Cambrian. Aside from this, parallelisms only can be suggested. Of course, as the pre-Cambrian rocks lack fossils, there are in them no such accurate means of comparison as in the later strata.

The congress in Mexico gave special attention to papers on ore deposits, and some interesting ones resulted. The Stockholm congress attacked a problem of the first magnitude under this head. It was the 'Iron Ore Reserves of the World', under which title, and by the co-operation of geologists in all parts of the world, an important two-volume work was prepared, with a large atlas of maps. In no other book of reference can so complete and authoritative descriptions of the world's resources in iron ores be found. Since Sweden is an important producer of iron ore, excursions were planned so that the delegates might see its mines, and especially the new developments in Lapland. There are now two districts which are active. The older one is at Gellivare. It has been shipping for many years from the port of Lulea, 123 miles distant, at the northern end of the Gulf of Bothnia. Navigation is closed, however, from November to May. Gellivare is situated 52 miles north of the polar circle. The mines at this place are distributed over a large ridge, and are based upon enormous bodies of magnetite in a gray syenitic gneiss. Many dikes of red granite and syenite penetrate them. The ores are associated with masses of hornblende and other basic minerals, collectively called *skarn*. The general consensus of opinion is that ores and *skarn* are basic segregations in a deep-seated eruptive. The open cuts are huge and profoundly impressed the visitors. Sixty miles farther north from Gellivare is Kiruna, where within the last ten or twelve years an important industry has been established. A great sheet of magnetite, generally high in phosphorus, runs along the crest of a ridge for two miles or more. It then drops beneath a lake and reappears two miles to the north at Luossavara. The ore averages 150 ft. thick, but where now worked is 500 to 600 ft. across on the horizontal. It dips at 60° to the east, and lies between a trachyte-porphyry foot-wall and a rhyolite-porphyry hanging. The ore is now shown to be later than the foot and older than the hanging and is believed to be, as the result of the last work, a lava sheet of nearly pure magnetite. It is extraordinarily rich. The shipments range from 65 to 68% iron. During the current year 2,300,000 tons will be produced, of which 300,000 go to Philadelphia. Mining has been begun in a smaller way upon Luossavara and also upon another hill lying three miles or so to the east called Tuollavara. From Kiruna the standard-gauge railway has been extended northwest 113 miles to Narvik, a port on the Norwegian coast which is a deep-water harbor, upon a fjord and open all the year round. Narvik has fine docks, ore-pockets, shoots, and shipping facilities of the most approved Lake Superior type. Ships can be loaded with the same despatch as at Duluth, Two Harbors, Ashland, or Escanabe. The ore goes chiefly to German and Belgian furnaces, for which its high phosphorus makes it especially desirable. The high percentage in iron raises the low percentages of the local minette ores. The visitors were again profoundly impressed with what they saw at Kiruna and Narvik and could not fail to express in the most emphatic way their admiration for the results accomplished under the vigorous management of Hjalmar Lundbohm, long a valued friend of many of us in America.

The sessions of the congress opened in Stockholm August 17 and continued one week, with many enjoyable entertainments from King, Crown Prince, and local committees. The prominent scientific subjects specially discussed, besides the topic of iron ores, were the changes in climate since the Glacial period; the first appearance of the Cambrian fauna; the recent results of Polar exploration, and the problems of the pre-Cambrian. There was a section devoted to economic geology, and there was probably the strongest gathering of workers in ore deposits ever collected, but the iron ore discussion overshadowed other matters. Following the congress a large party assembled to visit the iron and zinc mines of southern Sweden. The party was so large, in fact, as to be unwieldy for underground trips, but the Swedish committee did everything in its power to make them successful. The visitors saw the old-time workings and the modern improvements, and were deeply interested in the many evidences of careful and efficient management. They had the novel experience of being entertained at a banquet in a huge underground chamber, all of which had been excavated by fire and water with no explosives, two or more centuries ago. All the excursions terminated during the first week in September, and with many pleasant recollections of the eleventh congress, the six or seven hundred members returned to their homes.

New Klondike Dredge

By Guy A. R. Lewington

I am indebted to J. W. Boyle, president and manager of the Canadian Klondike Mining Co., of Dawson, for the following description of Canadian No. 2, the largest gold dredge operating in the world. It is safe to say that a record has been established in the construction of this dredge. The contract was placed with the Marion Steam Shovel Co., of Marion, Ohio, on January 21, 1910. All patterns were made, the machinery manufactured, and the last shipment forwarded from Marion on July 20. Construction of the framework of the hull was commenced August 4 and the dredge finished, with the exception of the digging line, stacker, and spuds, was floated on or about October 20. On November 5 the dredge was complete, and at once started to work. On November 15 this boat was successfully digging on bedrock, continuing to the end of the season, which is usually about November 25. The lumber was procured at Vancouver, B. C., and the dredge was constructed on the Boyle concession on the Klondike river, one mile below the mouth of Bear creek. The building of the hull and installation of all machinery was accomplished under direction of Howard Brenner, engineer for the Marion Steam Shovel Co. The dredge is electrically driven, with a continuous line of buckets, each of approximately 16 cu. ft. capacity, and will dig to a depth of 45 ft. below the surface of the water. The hull is built of selected British Columbia fir, reinforced throughout with steel plates and castings, and is 130 ft. long, 49 ft. wide, and 12 ft. deep, with an overhanging deck 3 ft. wide on each side, making the deck 55 ft. wide. There are four trusses, each over 20 ft. in height, running fore and aft, two through the centre of the boat, on either side of the well-hole, and one at each side. The two middle trusses have truss-chords 20 by 22 in., built up of 3½-in. fir, with 2¾-in. truss-rods, the chords abutting on the spud-casing timbers at the stern, and on the gantry timbers at the bow. There are two solid 10-in. bulkheads extending through the centre of the boat, forming the sides of the well-hole; two solid 6-in. bulkheads, midway between these and the sides, and two solid 6-in. bulkheads along the sides, all drift-bolted together with 22-in. drifts, bolted solidly through the post of the bents which are built up of 10 by 10 in. timbers. There are five cross-saddle trusses, two of which carry and distribute the weight of the main drive. The entire well-hole, bow, and both sides of the boat, for a distance of 40 ft. aft, are sheated with $^{5}/_{16}$-in. steel plate extending to the deck and turning back 18 in. under the bottom. The bottom plate extends entirely around the boat, and heavy steel plates $^{5}/_{16}$ in. thick and 2 ft. high extend entirely along the sides of the boat to the stern, which is sheathed with $^{5}/_{16}$-in. steel plates extending to the deck. The housing is of British Columbia fir, tongue and grooved, and is double sheathed on either side of the studding, leaving a 6-in. air space, one side being lined with heavy building paper. This method of housing has been determined as the most efficient in protecting the interior from the very cold weather of early spring and late fall. The total amount of lumber used in construction and housing is approximately 435,000 ft. Heavy steel castings are bolted to the stern, and countersunk into the timbers of the spud casings, and two large jaw-shaped steel castings are bolted to the steel traps extending 20 ft. along the upper truss-chords, giving protection to the hull and superstructure against the pressure and strain of the spuds. Heavy car-springs in the upper castings absorb the shock caused by the boat surging while in heavy digging. Along the top chords of the main saddle-trusses are tracks which carry hand-operated traveling cranes of 20 tons' capacity, which are at sufficient height to handle all of the main-drive machinery, and which travel the full width of the boat and overreach the roof about 2 ft. on each side. The bow and stern gantry caps are steel and are well fortified with heavy angles. The bow-swinging lines lead through a single sheave especially designed, which balances on raised bearings having a counterbalance and a swinging fair lead which travel with the line. These sheaves, like all castings throughout the dredge, are of open-hearth steel. The bucket-ladder is of the plate-girder type, 10 ft. deep, with a steel sluiceway along the top which catches the spill of the buckets and returns it to the pond through ports in the side of the ladder behind the lower tumbler, thus allowing the buckets to again pick it up. A compartment in the ladder, extending its entire length, is provided for steam-heating which keeps the ladder free from ice. The bucket-line comprises 71 close-connected buckets, which are cast in a single piece of high-carbon steel, with a manganese-steel lip 14 in. deep and 2¼ in. thick. The bucket bushings are of the full-circle type. The ladder-hoist is fitted with a separate motor of 200 hp., with automatic brakes, permitting the ladder to be handled in every way through the use of the motor-controller. The drum of the ladder-hoist is 48 in. diam. and is arranged for two hoisting lines. The winch machinery is of heavy construction, having 8 drums—4 for the side lines, 2 for the spuds, and 2 for general purposes. These are fitted with expanding band-frictions with check-belts, and arranged with reduction gears, giving two speeds in addition to the variation of the controller.

The main drive has self-aligning bearings throughout, with brass bushings. The upper tumbler-shaft is of hollow-bore nickel-steel 25 in. diam. with 18-in. bearings. The intermediate shafts are single, resting on bearings cast integral with the main-drive foundations. The foundations for the various parts of the main-drive bearings, the ladder-hanger shaft, and the main-drive motor, consist of heavy steel castings so constructed as to fit around the heavy gantry timbers, all of which are bolted together, forming a solid single foundation for the whole, thus rendering it impossible for any part to get out of alignment. The screen, or trommel, is of the straight type, 50 ft. long, and 9 ft. 9 in. diam., driven by a single-drive roller directly under the upper end.

while two small guide rollers, on either side, centre the screen on the driving roller: the lower end rests on rollers, one on each side. The perforated portion of the screen is 40 ft. in length. Especially designed wearing plates, placed in the bottom of the distributing trough, regulate the even distribution of the fine material to the tables. There is a single bank of sluice-tables extending along either side at right angles to the screen, and delivering into a sluice-box that empties into the pond at the rear end of the boat, giving, all told, a gold-saving area of slightly over 2000 sq. ft. The tables are fitted with especially designed steel riffles.

The 'save-all' is new in design, being built with a view to catching all that is possible of the drip from the returning buckets: it has deflecting plates over a cast-steel grizzly, and the whole is protected from the down-coming buckets by a set of 80-lb. steel rails. The save-all sluice is placed 2 ft. above the deck and empties into a long steel sluice which returns to the well-hole 15 ft. forward. The stacker is of the solid plate-girder type, built in box shape, entirely enclosed and so designed that the stacker-belt returns inside of the enclosure directly over a steam-heated chamber running its full length. The stacker is fully protected with a painted canvas hood. The two spuds are of steel, of the same size, 36 by 54 in., and 65 ft. long, fitted with rounded cast-steel points 15 ft. long. They are of the box-section type, with all angles on the inside. The pumps are high-pressure centrifugal, Morris make, and comprise one 14-in., driven by a 150-hp. motor, one 12-in., driven by a 75-hp. motor, and one 4-in., driven by a 30-hp. motor; all are direct connected.

All gears on the main drive, and all high-speed gears, have cut teeth. All bearings of the ladder and stacker rollers are especially designed and fitted with packing glands. The bearings of the lower tumbler are of new design, being double bushed with bronze bushings and rings, which take the end-thrust and are provided with packing glands which prevent grit or moisture entering. The ladder-hoisting tackle consists of two sets of blocks, with 6 sheaves each, attached to a 10-in. shaft, from which the ladder is suspended by two chains with cast-steel links 7 in. diam. and 5 ft. long. Each chain consists of five links and weighs 6080 lb. The entire weight of machinery and hull is approximately 950 tons. All sheaves for running lines are necessarily large and made of high-carbon steel. The bow and ladder-hoist sheaves are 48 in. diam. The dredge is steam-heated, a 50-hp. boiler furnishing steam for heating the plant, and hot water for flushing down the digging-ladder and stacker, and for keeping the sheaves free from ice. The winch-room is situated directly over the digging-ladder and is so arranged that the winchman, from his position at the controllers, has a clear view of the digging line, bow and shore sheaves, main drive, and spuds. The controllers and starters for all motors are in the winch-room and under the direct control of the winchman. There is also a system of electric-bell signals from all parts of the boat to the winch-room. All motors are direct-connected, there being no belts, and all drives are fitted with an especially designed safety-clutch used only by the Marion Steam Shovel Company.

The electric equipment was supplied by the General Electric Co. The motors in use were expressly designed and constructed for this dredge. They are

Dredge No. 2 Canadian Klondike M. Co., Near Dawson, Y. T.
(Built by Marion Steam Shovel Co.)

direct-connected to the 2300-volt transmission line, there being no transformers aboard except a small one used for the lighting circuit. The transportation difficulties encountered were many. The White Pass Railroad Co., in conjunction with its fleet of river steamers from White Horse to Dawson, delivered all the machinery from Skagway to Dawson in excellent condition. The great size and weight of many pieces of the machinery necessitated special transportation facilities, which were promptly provided; this speaks much for the development of transportation facilities in the Yukon basin. The moving of all this machinery from the docks of the White Pass Co., at Dawson, to a point seven miles up the Klondike valley was handled by local teamsters. The delivery of the heavy parts made it necessary practically to reconstruct all bridges along the road, straighten, and in many places re-gravel, the road, in order to prevent the wagons from breaking through. Twenty-six horses, hitched four abreast, except the wheelers, were necessary to move the spuds, which weighed 27 tons each, without the point (points weigh 5 tons). Each spud was placed on two especially constructed trucks, one being at each end. The digging-ladder, which came in three pieces, also required the same number of horses. The freight was all delivered so that little or no delay was caused by non-arrival of essential parts a most happy condition of affairs, although an absolutely necessary one to quick construction. Mr. Brenner found no difficulty in securing all the labor, both skilled and common, that he needed, from among the men of the country. The Canadian Klondike Mining Co. has also provided a complete machine-shop so that all ordinary repairs can be made on the ground. The property belonging to the Canadian Klondike Mining Co. is what is generally known as the Boyle concession, and is one of the ideal areas of dredging ground in the Far North. The greater part of it is not frozen, and it has a supply of water from the Klondike river which never entirely freezes, so that by the use of artificial means, dredging may be carried on from early in April to about November 25, or fully two and a half months longer than conditions will permit on any of the other properties now being dredged.

This company also has a 7-ft. Marion dredge on its property, which has been working successfully for the past five years and is in excellent condition, and still good for many years' work. It was the success of this dredge that proved to the company the great advantage to be derived from the installation of a very much larger dredge, and this has resulted in the building of Canadian No. 2, the success of which will no doubt be watched closely by all who are interested in dredging.

Hornsilver and silver chloride are one and the same thing. There can be no distinction between the condition of the mineral, whether occurring in dust-like particles or in solid masses. It is the composition of the mineral that determines, not its physical condition.

Gold Mining in California in 1910

By William H. Storms

Notwithstanding the general business depression of the past year, gold-quartz mining in California has given unmistakable evidence of a revival, which appears to have extended throughout the entire length of the State. Many old properties are being re-opened and new ventures started, which in most instances give good promise of success. The onward trend of events has been published in these columns weekly, as they occurred, and a review of the past year's happenings shows a great improvement in conditions over those of the previous year.

Little of general interest has been done in gold mining in the extreme southern end of the State, in San Diego, Imperial, Orange, Riverside, and Los Angeles counties, although there are gold mines in each of these, and some that are excellent. What is most needed there is new capital, new energy, and competent experienced management. For lack of them, these southern counties have suffered seriously. Within the past three months there have been reports of resumption of operations on the Golden Cross group of mines, at Hedges, 20 miles northwest of Fort Yuma, but nothing of importance has been done thus far. These are among the largest mines in the State and are equipped with 140 stamps. There are gold mines scattered throughout this southern region, particularly in the desert, but they are mostly operated, when at all, on a small scale, owing to their situation many miles from water, fuel, or convenient means of transportation. The re-opening of the Needles smelter under management of the U. S. S. R. & M. Co., has stimulated mining throughout southern California and Arizona, and is sure to be of still larger influence. In San Bernardino, Inyo, and Kern counties, the greater portion of which is desert territory, the usual amount of development has been in progress, and ore shipments have been made from numerous small mines, particularly of copper-gold ores in eastern San Bernardino, and of zinc-lead in Inyo county. Mining for borate minerals in and near the East Calico hills, has been continued with satisfactory results, some new ground having been developed. Indications are that the borate deposits are extensive, though of lower grade than that formerly mined in the famous colemanite deposit at Borate. High-grade gold-silver ore has been shipped in carload lots from the Coso range, and prospecting has been unusually vigorous during the year in both the Coso and Panamint ranges. At Randsburg, in Kern county, a district discovered in 1894, and where all expectation of finding anything new of importance had been abandoned, a fortuitous discovery was made the past summer, when a heavy rainstorm caused the outcrop of a vein to be exposed in a trail near the Butte mine over which thousands of miners had traveled for years. The ore was rich, and shafts were promptly sunk along its

course for several thousand feet and a new lease of life given the mines of Butte hill. There has also been some renewed activity in the Piute mountains of Kern county, where mines of gold and silver have been operated in a more or less desultory manner for half a century, and new equipment has gone into that district. Tungsten ores are also reported discovered in that vicinity.

In Mariposa county there have been some encouraging developments, particularly in the vicinity of Hornitos, where new mines are in operation and some old ones have been resuscitated. The region about Big Oak Flat and Groveland, near the Mariposa-Tuolumne county line, has also attracted considerable attention, and development is proceeding there, it is said, with satisfactory results.

On the Mother Lode there has been a noticeable revival of interest, extending from the northern part of El Dorado county to Mariposa county on the south. In the latter county, little of consequence has been done on the great Lode, the larger part of which is covered by two large estates, those of the Mariposa Mining & Commercial Co. (Fremont Grant) south of the Merced river, and that of the

Mines on Deer Creek, Nevada City.

Merced company (formerly the Cook Estate) near Coulterville. However, in Tuolumne county there has been unusual progress. The Republican, at Jacksonville, has renewed operations, and efforts to reopen other mines in that vicinity are being made. The Eagle-Shawmut mine, one of the largest mines in the State, near Chinese, has been practically idle for several months, owing to lack of power. This has long been one of the influences retarding mining in Tuolumne county. Each summer season for years past, there has been a shortage of water, owing to lack of sufficient storage capacity in the mountain-reservoirs. It would seem that this condition would have been improved before this, but each succeeding summer finds the same unfortunate condition. Mines are obliged to suspend operations, and great damage, in some cases, results to the underground workings. Rich ore has been found in the App and Heslep mines at Quartz, and new development is in progress in that vicinity. Prospecting for river gravels has also been given renewed attention in this county, notably near Chinese, Columbia, and in the Stanislaus canyon. A rich find was reported a few weeks ago in the Tarantula mine on the Mother Lode, west of Tuttletown, and the Toledo mine, west of it, is being reopened after many years of idleness. The Dutch mine, near Quartz, after being idle for some time, is again in operation. On the East Lode, at Soulsbyville, the Bagdad-Chase company has succeeded, it is said, in again placing the old Soulsby mine on a paying basis. This famous property made a production of over $6,000,000 from a small vein in early days. This company also owns a large group of mines south of Ludlow, in San Bernardino county, and operations are to be resumed there, after a long idleness. Near the

Zeila Mill, Jackson.

town of Tuolumne there has been vigorous prospecting work done in various mines, and good ore found. The old, long-abandoned Buchanan mine, several miles southeast of Tuolumne, is to be reopened. At this place is an excellent opportunity for mining at great depth by means of adits, as the outcrop of the Buchanan mine is 2300 ft. above the canyon of the Tuolumne river, which crosses by the lode, a mile south of the mine. The Black Oak mine, near Soulsbyville, has been the scene of renewed operations during the year, and some new prospects are being developed east of Sonora, not far from the old Bellevue mine.

In Calaveras county, numerous old and new properties have been receiving the attention of investors,

Empire Mine and Mill, Grass Valley.

both on the Mother Lode and on the East Lode, particularly on the latter near West Point. Near Mokelumne Hill, too, development and new equipment have contributed to the general activity. One recently inaugurated enterprise is that to dredge the tailing accumulated in Chile gulch from the operation of numerous great hydraulic mines in past years. There are millions of cubic yards of this material filling the gulch from depths of 20 to 100 ft. for several miles. The channel gravel originally was rich, or much of it was, and it is not unlikely that this débris may contain gold to a profitable

extent, if mined with a dredge. It seems unlikely, however, that a dredge can be floated in a pool of water, after the manner of the dredges operating in the valleys, owing to the comparatively heavy grade of the gulch and the character of the material to be handled, which will make it difficult to maintain a pond sufficiently deep to float the boat. At and near Angels the old mines are mostly in operation, with a renewal of life in Smith's Flat area, west of Angels. The Gold Cliff, Lightner, and Angels mines are operating steadily, and the Lightner is being re-opened by a new shaft now being sunk. Prospecting is in progress along the line of the Lode, both north and south of Angels.

Amador county is showing decided signs of prosperity and gives promise of continuing to be a large, and probably a greater, gold producer for many years to come. Here are the deepest gold mines in America. The Kennedy, over 3500 ft. deep, the Argonaut, over 3300 ft., and South and Central Eureka, each nearly 3000 ft., are all in full operation, with developments which assure many more years of profitable existence. The Bunker Hill mine, half a mile north of Amador City, and the Fremont Consolidated, half a mile farther north, are both deep mines, and operating to the fullest capacity of their equipment. These are the great active mines of the county, but, in addition to them, are the Kennedy Extension, formerly the Muldoon mine, adjoining the Argonaut; the Lincoln, at Sutter creek; the Alpine, at Plymouth, and several smaller mines south of Jackson, where development is being urged with all possible speed, and with excellent prospects for becoming great mines. The Original Amador mine, at Amador City, is one of the latest properties to be re-opened and fully equipped with hoisting and milling machinery. It is said to be a successful enterprise. It certainly has an excellent piece of ground and a good equipment. In eastern Amador some prospecting is being done on the East Lode, but mining is less active there than in former years. In the low foothill region, near Ione, some successful mining for gold and copper is reported.

In El Dorado county more than usual activity has characterized the year. El Dorado has produced millions of dollars in gold, mostly from ores of unusual richness, and there a few of the oldest mines in California are still being operated. Some of the cheapest quartz mining in the State has been done in this county, where gold ore has been mined and milled for less than 60c. per ton, but under exceptionally favorable conditions, of course. Work has been resumed on numerous abandoned mines in various parts of the county, and it is expected some of these ventures will develop into permanent and profitable enterprises. Recent examinations of some idle property in the county will probably result in the resumption of operations.

In Placer county, although there are profitable quartz mines, the industry is more particularly concerned in the drift-mining operations on the ancient river channels of the Forest Hill and Iowa Hill divides, and others occurring nearer the Sierra Nevada. In this branch of mining, in Placer county, there still remains a large and almost unknown field, particularly that portion lying northeasterly from the east end of the Forest Hill divide. There are many encouraging prospects there which remain undeveloped for lack of capital. Moreover, the channel system is little known, and opportunities for legitimate investment are still numerous, and these will, in time, undoubtedly be taken up.

Nevada county has continued to contribute its annual gold output. The deep mines of Grass Valley, and those near Nevada City, have been operated uninterruptedly, and some old properties, long idle, have been reopened, newly equipped, and there is no present evidence that mining will not be successfully continued in Nevada county for many years. At the North Star mines, near Grass Valley, the metallurgical branch has been given an unusual amount of attention during the past few years, and an elaborate plant provided for the treatment of the ores. The Empire mine, at Grass Valley, has built a cyanidation annex to the stamp-mill which has been designed along the lines suggested by the successful experience at the North Star mill. The Champion-Providence mines, near Nevada City, have been involved in litigation for some time past, but this is about settled, and operations will be resumed with new energy. This company has a large area of undeveloped, but undoubtedly valuable ground. In the eastern part of Nevada county, in Meadow Lake district, the usual amount of experimenting has been done, but this interesting district seems always to lack that fortunate combination—capital and experience.

Sierra county has shown more activity the past year than in many previous years. The success of the Tightner mine has stimulated prospecting, and many new properties are being developed in a small way as well as old mines re-opened, among these latter the Sierra Buttes, which in early days was one of the famous producers of the State. Across the river in Plumas county, the Plumas Eureka has also been re-opened, and there has been a general renewal of mining interest thereabout. The mines of Lassen county have done little the past year, the plant at the Hayden Hill having been burned. It is now being rebuilt. In Modoc county, in the extreme northeast corner of the State, a new district, near Fort Bidwell, is being opened. Some of the numerous properties there are likely to become producers within the coming year. The most important of these, thus far, is that owned by the Fort Bidwell Con. M. Co., which recently placed a mill on its property. In Siskiyou and Trinity counties gravel mining has been the attractive feature, although development of quatz mining has not been neglected.

It will be observed from this necessarily brief résumé of the situation, that the gold-mining industry in California has been progressive and not retrograde, as in some instances elsewhere. This is also evidenced by the fact that the gold production of the State for 1910 will be found to approximate $21,000,000, of which amount the dredges, the drift, and hydraulic mines produced about $7,000,000.

Swedish Mines and Mining

By Horace V. Winchell

Archean Geology.—For the student of the Archean there is a splendid field in Sweden, and to the economic geologist, Sweden is one of the most interesting countries on the face of the globe. Its great age as a centre of mining, the magnitude of its deposits, and their unusual types, provide material for innumerable *wunderbars* of the Teuton, and challenge the utmost exaggeration of the Yankee to suggest their equal in his own land. Historically, mining operations here are lost in the mists of antiquity. Methods and machinery had established vogues and patterns 350 years ago, in the days when Agricola, the Nestor of mining, published his classic treatise. Indeed, some of the machinery pictured by him in 1556 still finds its counterpart in Swedish iron and copper mines, steadily doing duty side by side with electric hoists or smelting plants of the most modern design.

Although Paleozoic and Mesozoic strata are found in Sweden, yet the larger portion is covered by the Archean rocks: gneisses, schists, intruded rhyolite, and porphyries. These eruptives have been in many instances profoundly altered, and the ancient ore deposits, which they were instrumental in producing, have undergone a varied and unusual history. The Swedish Archean consists of three petrographically and geologically different groups of rocks. These have long been named: the gneiss group, the porphyry-'hälleflintgneiss' group, and the granite group. Recently this terminology has been modified by the exchange of the term hälleflintgneiss for leptite, the latter having been proposed in 1875 as a collective name for the same rocks. The porphyry-leptite group, as the new designation also runs, includes fine-grained gneisses, schists of many types, especially certain dense green rocks called in Sweden hälleflinta, limestone, dolomite, argillaceous schist, quartzite, and conglomerate, together with porphyry and porphyroid rocks to a large extent. Many of the rocks of this group bear traces of having once been formed at the surface as lavas, tuffs, tuffites, or normal sediments. The latter, however, are only subordinately represented in the Archean. The leptites themselves, which form by far the greatest part of this group, are closely related to the other rocks and seem to be metamorphosed rocks of volcanic origin: lavas, tuffs, or tuffites. Consequently the 'porphyry-leptite group' corresponds very well to the designation supererustal rocks, which has newly been proposed by the eminent explorer of the Fennoscandian Archean, J. J. Sederholm. Supererustal rocks also form a great part of the gneiss group, but the high degree of metamorphism, which characterizes the gneisses, mostly conceals their primary petrographic character and geological relations so as to make their origin in many cases doubtful. The gneiss group includes also gneiss-granites. By this term Swedish petrographers understand granites strongly affected by regional metamorphism such as crushed, foliated, or granulated granites; often with a clearly marked secondary parallel structure. The third is the granite group. This embraces all the numerous types of granites, in which the Swedish Archean is so rich. Great areas of Sweden consist of these rocks. Together with the gneiss-granites they certainly make up much more than 50% of the Archean. The contacts show that the granite magmas have cut all the other rocks and must, therefore, be considered the youngest. They are real plutonic eruptives. Together with the gneiss-granites, and the gabbros and diorites which appear in smaller quantities, the granites may be said to form the infraerustal rocks of the Archean, in accordance with the Sederholm nomenclature.

Mines at Utö.—What is known as the porphyry-leptite group of rocks is associated with iron ores in central Sweden and also near Stockholm, extending along the coast to the islands Utö, Ormö, Namdö, and Runmarö. The rocks are hälleflintas, leptites, mica schists, porphyry, epidote or amphibole-bearing green schists, calcareous schists, limestones, and iron ores. They are all bedded, often regularly and with alternations, which makes them closely resemble stratigraphical complexes. Their structures are, however, wholly crystalline and the bedding planes are now always nearly vertical. The iron ore at Utö is the type known as *randig blodsten*, or quartz-banded hematite similar to Minnesota jaspilite. The quartz is gray or reddish, and the iron ore is hematite with more or less magnetite. Beds of amphibolitic rocks accompany the ore and thin green layers alternate with the iron ore strata. The mines in Utö were worked as early as the beginning of the seventeenth century, and operations continued down to 1879. From 1711 to 1878 the output was 2,070,900 tons of iron ore. The total production is estimated at 2,500,000 tons. The ore was not of high grade, containing before concentration but little over 40% of iron. The Nyköping mine was worked to a depth of about 650 ft., and the Finn mine about 500. Two famous lithia pegmatite dikes cut across the folded iron orebody of Nyköping. Here the element lithium was first detected by Arvedson, a pupil of Berzelius, in 1818. These dikes are among the most important known natural resources of lithia.

Adjacent to the iron-bearing zone of Utö is a mighty series of limestone and hälleflinta. The limestone is finely crystalline and alternates with the hälleflinta in bands from only a few centimetres to several metres in thickness. Where intensely folded and crystallized the hälleflintas resemble amphibole schists: and, indeed, the bedded complex is bordered on the east by a thick layer of green amphibolitic rock containing thin limestone layers. This green rock resembles the green 'skarn' or gangue rock of the iron mines farther north. Associated with these rocks is a greenish gray bedded leptitic hälleflinta which likewise contains a few thin beds of limestone. Then comes the regular bedded leptite, containing layers of nearly massive porphyritic rocks, which are undoubtedly altered lava beds and tuffs. The leptite is sometimes quartzitic and almost itself a quartzite. It is composed of quartz, feldspars, bio-

tite, and muscovite, and may be recrystallized volcanic ash, or mud. It is even occasionally coal bearing, and is mingled with limestones. The iron ore is perhaps a chemical sediment. There were silver mines also at Utö. Native silver occurs mingled with epigenetic sulphides of copper, iron, lead, and zinc. The mines are not now operated and were never important.

Upsala and Vicinity.—In the central portion of Sweden is the university town of Upsala. If Stockholm is the Venice of the North, Upsala is surely the Boston of the Arctic. Here for hundreds of years has been a centre of learning and culture. Here lived and wrote Sweden's greatest scientist, Carl von Linnaeous; and his house, with all of his natural history collections, is still preserved on the old farm, a couple of miles outside of the city. Not far from Upsala are Dannemora, Sala, Krylbo, Karrgrüfvan, Norberg, Hagge, Ludvika, Grängesberg, Persberg, Ammeberg, and Falun.

Dannemora.—Like many other Swedish iron mines, Dannemora was first worked for precious metals. The date of its discovery is approximately fixed by a deed of gift dated 1481 by which Sten Sture, the Elder, conveys to the Archbishop of Upsala and his successors one-fourth of the silver mountain in the parish "which was discovered a few years" before. When Gustav Vasa secularized the church lands, the mine reverted to the Crown, and was first leased to Joachim Piper, a burgher of Stralsund, in 1532. Iron ore was still only a subordinate product mentioned along with "sulphur, vitriol, antimony, lead, tin, copper, silver, and gold." By 1545 iron ore production had become important, under a lease from the Crown. Later, in the seventeenth century, the works and mines passed into the possession of private owners. Gunpowder for breaking the ore was first tried at Dannemora in 1728; and in 1727 a wonderful "fire and air engine" was set up for raising the water. In 1805 a steam-engine of Watt's construction, the first in Sweden, was installed.

The rocks at Dannemora are crystalline schists with intrusive granites. There are also other intrusive dikes. The Dannemora ore district is chiefly occupied by hälleflinta, the porphyritic having the greatest extent. This almost encloses the limestone and other varieties or phases of the formation. This so-called 'porphyritic hälleflinta' consists of a dark-colored, microcrystalline, fine-grained, quartz-feldspar rock with a rich admixture of a sericitic mineral of secondary origin. Chemically, it is an acid quartz-porphyry. Many variations in color, texture, and geological relations occur in this field; and north of lake Grufsjön it passes into granulite or leptite. The ores are enclosed in a limestone mass, which has a length of about 3000 metres and a maximum width of about 450. Composed exclusively of magnetite, the ore has a characteristically fine-grained structure, often as compact as steel. It occurs associated with skarn or gangue (called *bräcka*) and more or less mingled with limestone. The iron present varies from 20 to 65%. The more important ore deposits belong to a number of complexes, some of which contain several parallel ore layers. In each complex there occur several independent ore-stocks, separated by limestone or *bräcka*. Such ore-stocks may be connected with other ore-stocks in the direction of the pitch or toward the depth. They are usually nearly vertical. Their horizontal extension in the line of strike may reach 200 to 300 metres and their thickness 30 to 40. The mines of the central field have been opened from the surface on several orebodies of great thickness, partly separated by gangue and branching toward the north. On the south this extensive ore formation is almost entirely cut off by a system of parallel chlorite leaders, which form the southern wall of the Hjulvind mine, and somewhat resemble a fault. These chlorite bands or 'sköls' were probably originally diorite dikes which acted as a dam in cutting off the ore injection or the solutions by which it was formed. Quantities of sulphides, chiefly zincblende, have been introduced metasomatically at a later period, impregnating both the ore and the later granite intrusions.

Långban.—The mines of Långban have produced small amounts of argentiferous galena and sphalerite, and considerable quantities of manganese and iron ores. Here, as elsewhere in central Sweden, the ore-bearing formation is a crystalline schist. It consists here chiefly of granulite and dolomite. Closely associated is a gneissic granite. Two varieties of younger intrusive granite dikes occur, and various still later diorite and diabase dikes. Pure dolomite bears such a constant relation to the ore or sköl formations that it is concluded that the ore-depositing agencies had a marked effect also upon the dolomite, which is characteristically banded by lime magnesia silicates, except adjacent to the ore and sköl. The ores occur in stockworks, usually containing both iron and manganese. There appears to be a tendency to scatter and diminish in importance at moderate depth. The deepest workings are about 200 metres. The gangue of the iron ore-shoots is called skarn and is of varied color and mineral composition, containing gray-green malacolite, brown and black garnets, and ferruginous quartz. There are also unimportant deposits of sulphide ores of copper, iron, lead, and zinc. Many sköl layers or bands bound the ore and extend through the adjacent rocks. In some instances these sköls are squeezed and altered greenstone dikes that seem to have been present before the ore was deposited, and to have formed a boundary to it or determined its extent. In other cases they are more or less micaceous and represent transformed granulite or leptite. Still other occurrences resemble very old shear-zones or fault-planes whose filling has been transformed into crystalline rock material. Later fracturing has occurred, and the cracks have been filled with calcite and other secondary minerals.

In this same neighborhood are also the mines of Norberg, Flogberg, and Persberg. The principal features of interest are the skarn ores and the calcareous ores, the former of which are hornblendic magnetites and the latter serpentinous and amphiboliferous limestones which are found intermixed

with small patches and lenses of the skarn ore.

Persberg.—This is one of the oldest mining fields in Värmlands Bergslag. Mining dates back to the thirteenth century; and the first mining privileges were granted by King Erie the Pomeranian in 1413. The Bergmaster's report for 1637 states that "the whole mountain is nothing but ore, and of mighty richness, and can be smelted without flux," from which it can be seen that the art of writing mining prospectuses based largely upon the imagination did not originate in the United States. The total output of the Persberg mines is estimated at less than 4,000,000 tons. Fifty years ago the annual production was about 50,000 tons. At the present time it is about 30,000 tons. The ore is of excellent quality and has contributed largely to the reputation of Swedish iron in the world's market. The best grade of ore contains 55% Fe, 0.001 to 0.004% P; the second grade 45% Fe and 0.005 to 0.01% P. The sulphur content varies from 0.012 to 0.025%. The deepest workings are now about 1000 ft. Machine-drilling was first started in Sweden at Persberg about 1864. These mines were well described by Linnaeous about 1746. Powder for blasting was introduced about 1720. The skarn ores are believed by Sjögren to owe their origin to the metamorphic influence of greenstones upon limestones. There are, however, considerable ore deposits which are, so far as can be seen, without any immediate limestone association. The granite eruptives may also in some instances have been active mineralizing agents. Granulite or leptite is abundant, cut by skarn zones, which contain the ores.

Sala.—The history of the Sala lead and silver mine extends over four centuries. The ore deposits seem to have been discovered early in the sixteenth century, being mentioned in a document dated September 1, 1510. The palmy days of this district were in the early half of the sixteenth century, when it furnished an important part of the public revenue. By 1571, mining operations were difficult on account of water. Kings Carl IX and Gustavus Adolphus both tried their hands at it; but for fifty years little progress only was made. The grade of the ore declined with greater depth, but renewed exploration in the upper levels discovered more ore once in the latter part of the seventeenth century and again a hundred years later. At present an effort is being made to utilize the zinc ores that were left in the mine by former operators. The total production of silver of the Sala mine is estimated at about 400 tons, of which about one-half was produced in the sixteenth century. Sjögren states that from an economic point of view the mine was run at a loss for three and a half centuries. It was kept going only by means of special privileges from the Crown. The fact was noted at an early date that the ores declined in richness toward the deep. This phenomenon, which is not peculiar to Sweden, is commonly ascribed to secondary enrichment from the surface downward; but Sjögren, to whom we are indebted for a description of many of these mines, and who went with our party as guide, philosopher, and friend, does not accept that theory. Here again the crystalline schists or basal complex of hälleflinta and limestone, cut by granite and porphyrite intrusions and by later diabase dikes, form the country. The carbonate rocks are most closely connected with the ores. Galena is found chiefly in the limestones and only to a very subordinate extent in the hälleflinta. Copper ores occur in the limestone; while small iron mines in the district are connected with the hälleflinta. This latter rock here presents an extremely varied formation whose only common character is the felsitic texture of the ground-mass. It is dark, or light gray, or brownish, and is sometimes striped or banded. A few varieties have a purely granitic or quartz-porphyritic constitution; in general, however, the percentages of alkali are lower than in the quartz and felsitic porphyrites, and the constitution corresponds rather to that of the dacites and quartz-porphyries, with which rocks the hälleflinta also shows points of agreement in the quantity of ferromagnesian silicates. On the whole, the rock in its composition stands closest to the intermediate eruptives.

Grängesberg.—The Grängesberg iron ores occur in the usual formation of gneissic rocks, called granulites, hälleflinta gneisses, or leptites. Included in this formation are also amphibolitic or dioritic greenstones, skarn rocks, crystalline limestones, and iron ores. Later granitic and diabasic eruptives are also present. The ores are (a) apatitic; (b) quartzose hematites; (c) skarn ores; and (d) calcareous ores. The two last as well as the first are non-manganiferous, non-titaniferous magnetites. The iron content varies from 55 to 65%; and the phosphorus from 0.1 to 8%. Thus the mineral apatite sometimes amounts to more than 40% of the ore.

Falun copper mine is historically one of the most remarkable mines in the world. Worked without interruption for the past 650 years, it had, down to the end of the nineteenth century, produced more copper than any other mine on the globe. From 1630 on, complete records of its production are extant. According to these the total output in that time amounts to nearly 300,000 tons, or 600,000,000 lb. of copper. From the commencement of mining operations to the present time its output has been estimated at 500,000 tons of copper, 1 ton of gold, and 15 tons of silver, valued at about $250,000,000. For the sake of comparison it may be noted that in these days of monumental performances the total estimated output of the Falun mine in 650 years is about equal to three years' production of the mines of Butte. The ore was formerly richer, and the possibility of secondary enrichment is again suggested. At present the mine is worked for pyrite, which is used in the sulphite-pulp digesters belonging to the company which operates the mine. This corporation, although one of the oldest in existence, is one of the most progressive and profitable concerns in Sweden. The date of its actual foundation is not known; but it is supposed to be about the year 1225. There is in existence a deed dated 1288 conveying certain shares of stock; and a charter of the company, given by King Magnus of Sweden and Norway, is dated February 24, 1347, at that time

ratifying and confirming the company's rights and privileges which are mentioned as "very old." The company, whose full address is Stora Kopperbergs Bergslags Aktiebolag, Falun, Sweden, began to make or produce copper about the year 1225, sawed-lumber in the year 1689, iron in 1735, gold and silver in 1790, bessemer steel in 1871, open-hearth steel in 1878, electric steel in 1904, soda (sulphate) pulp in 1895, sulphite pulp in 1900, paper in 1900, and bismuth in 1904. It owns vast forests, 200 iron mines, and water-falls estimated to be capable of yielding 150,000 hp. It makes the specially soft charcoal wrought-iron for which Sweden is famous. Its annual production is, pig iron, 75,000 to 100,000 tons; bessemer ingots, 70,000; open-hearth ingots, 26,000; charcoal iron blooms, 4000; rolled and hammered iron and steel, 75,000 to 100,000. It uses 450,000 cubic metres of charcoal per annum, making 150,000 cubic metres in its own kilns.

The Falun mine, called 'The Country's Treasury' by Gustavus Adolphus, is 1200 ft. deep and has about 18 miles of underground workings. The bottom of the mine is now full of water, and many of the old workings are inaccessible. During the first 400 years of its history the ore was broken by burning wood against it. Gunpowder was first used in 1729. The ore was raised by means of windlasses worked by hand or horse-power, and the ropes were made of ox-hides, 200 to 300 hides being required for a single rope. The country rock at Falun belongs to the crystalline series represented here by gray gneiss and granulite or leptite. The gneiss is locally a quartzite which is the true ore-bearing rock, and to it belong also the other copper ores of this and adjacent districts. It contains amphibole and, as accessory minerals, cordierite and its alteration products, falunite, andalusite, and magnetite. There is also considerable white saccharoidal limestone. Composite basic dikes also occur, cutting both ore and country-rock. The ore of the Falun mine is pyrite occurring in various modes, more or less associated with sulphides of lead and zinc. In the upper levels the ore was considerably enriched, and probably contained the higher grade copper sulphides. Occurring in stocks of bluntly conical form with the point downward the former interior of the orebodies is now seldom seen. They consisted largely of nearly pure pyrite with a slight percentage of copper. There was also a quartzose mixture of copper pyrite and pyrite containing fragments of quartzite and limestone. There is here also a considerable development of skarn at the contact of quartzite and granulite. It consists of a dark green mass of radiate and sometimes garnetiferous amphibole. Then there are sköls more or less closely connected with the pyrite stocks and surrounding them or separating them from the other rocks. They consist partly of amphibole, biotite, and cordierite, and partly of their hydrated derivatives, chlorite, talc, and falunite. There are also secondary garnets and magnetite octahedrons and later sulphides. The sköls sometimes have a thickness of 10 to 15 metres, and again they thin out rapidly. They grow smaller in depth and have in general a development proportional to the extent of the ore mineralization. The richest ores the mine ever produced came from the upper zones of the sköls. The 'hard ores' lie immediately in the quartzite without being enclosed by sköls or leaders, and pass by insensible gradations into the rock itself. All the ores appear to come to an end at the maximum depth of 250 to 280 metres. Gold occurs associated with galenobismutite, in small quartz veins. Some selenium has also been found associated with trap dikes which contain amphibole in a felsitic groundmass of quartz and plagioclase. The gold ore was the richest at the depth of from 40 to 100 metres. Workable gold ores have not been found below 200 metres. The surface of the pyrite and neighboring limestone in some places retains the grooving and striations of the glacial period. It is interesting to note that there has been barely perceptible oxidation and solution in the five thousand or more years that have elapsed since Jack Frost here made his mark.

WORK OF GEOLOGICAL SURVEYS IN THE MISSISSIPPI VALLEY

Several changes in personnel of State Surveys occurred in 1910. H. A. Buehler has been appointed Director of the Missouri Survey. R. C. Allen has succeeded A. C. Lane as State Geologist of Michigan. Edward Barratt was elected to succeed W. S. Blatchley, who has been State Geologist of Indiana for sixteen consecutive years. The new Geological Survey of Tennessee has been placed in charge of George H. Ashley, formerly of the U. S. Geological Survey. In Wisconsin, W. O. Hotchkiss is now State Geologist. The Tennessee Survey has already issued timely bulletins relating to the geology and to the economic deposits of the State. It has among its duties a study also of the drainage problems, forestry, distribution of soils, and development of water-power. Co-operation has been established with many Federal bureaus, notably the Department of Agriculture and the Geological Survey. The former co-operates in the study of soils, public-road building, and drainage investigations; the latter, in topographic and geologic surveys, and particularly in oil studies. Work in Michigan and Wisconsin, to some extent, has been concentrated on iron and copper in the Lakes region. In Illinois, co-operative geological studies with the U. S. Geological Survey have been continued in the coalfields in northern Illinois at La Salle, in the central part of the State near Springfield, and in the southern fields of Williamson, Franklin, and Jackson counties. The general geology and mining problems of the lead and zinc region have been taken up on a thorough scale by State and Federal surveys. A study of the Illinois oilfields has required increased attention, particularly in connection with the new field at Sandoval and with scattered drilling outside of developed territory. In Missouri, in addition to the continuation of the studies of lead and zinc, an important resurvey of the coalfields has been in progress in co-operation with the U. S. Geological Survey.

A B C of Empire Drilling—I

By J. P. Hutchins and N. C. Stines

*The purpose of this article is to give details essential to the efficient manipulation of a particular type of drill as used in the sampling of alluvial ground. Incidentally other information bearing upon this branch of mining is offered. The drill to be described is the Empire hand-drill. There are other hand-drills, but they do not have the same complete outfit as the Empire. For the purpose of comparison we refer the reader to an article entitled 'The A B C of Keystone Drilling' by J. P. Hutchins, published in *The Engineering and Mining Journal* of December 14, 21, and 28, 1907. It affords a comparison between drilling by hand and by power, respectively. After several years of experience in the use of this and other hand-drills with and without rotated pipe, suggestions are offered in the hope that they may prove useful to our fellow engineers. The Empire hand-drill is characterized by the employment of a rotating pipe, strong enough to withstand severe strain and to permit of threads being cut on it: it is therefore not an ordinary 'casing' which merely encases the hole formed by the drill.

Set-up of Drill and Rotation by Hand.

Object of Sampling.—The object of sampling an alluvial deposit is to ascertain its tenor, volume, or extent, and physical characteristics. The physical characteristics include depth, degree of induration, size, occurrence, and proportion of sand, medium and big boulders, distribution and characteristics of clay, and of buried timber, occurrence of frost, annual or perennial, characteristics and tenor of overburden and bedrock, contour of bedrock, occurrence and proportion of sand, depth to water-level, and distribution of valuable contents.

Samples may be obtained by open-cutting, drilling, or shaft-sinking, and in each case the valuable content washed from the sample by panning, rocking, or sluicing. One or all of these operations may be required in getting the data necessary.

Kinds of Deposits.—For convenience of consideration in this article, alluvial deposits may be divided into two classes according to the method by which they are worked—by open-cutting or by 'drifting.' The first includes hydraulicking and dredging. The second includes many varieties of underground mining having for its object the extraction of one or more rich strata of gravel through shafts, inclines, or tunnels. All other kinds of placer mining are classed under open-cutting. Inasmuch as it is usually only necessary to prospect the lower stratum for drift gravel mining, it is often possible to apply such methods as have for their object getting data concerning it only. But it is necessary to sample the total gravel section for open-cutting, for all the material must be handled in the course of exploitation.

Drilling may be done by electric, gasoline, or steam-power drills, or by those operated by hand alone, or by hand assisted by horse-power.

The immediate object of this paper is to describe fully (1) the obtaining of the sample with the Empire hand-drill, (2) recovering the valuable content from the sample, and (3) ascertaining its value.

History of the Hand-Drill.—This device with rotated pipe seems to have been evolved fifty years ago in two places: in America for drilling water wells, and in the Dutch East Indies (where it was known as the Banka drill) in testing for tin. This type of drill was not used in prospecting for gold until about five years ago, when it was applied in America. Until then it had been used where labor was cheap and no serious attempts had been made to economize in this respect, but as soon as it was introduced into North America, where labor is expen-

Changing Tools.

[*We are requested by the authors to say that while this article is devoted to a detailed description of a particular drill, it was not written with the purpose of furthering the sale of any drill, but with the sole desire to give useful technical information through the medium of the *Mining and Scientific Press*.—Editor.]

sive, many improvements were made. These improvements with numerous refinements of construction and operation, changed the drill from a very primitive machine to a complete sampling outfit, requiring not only less labor, but less time, and able to overcome difficult conditions, such as frozen ground, and capable of taking more accurate samples.

Briefly the drill consists of a pipe, a platform, rotating and driving devices; boring, drilling, pumping, and pulling tools; all for penetrating to and into bedrock, for obtaining and treating the sample, and for pulling the pipe from the hole. In a few words the operation is as follows:

The pipe, having a toothed cutting-shoe on the bottom, and a platform on the top, is placed in an erect position at the spot where the sample is to be taken. Some of the crew steady the pipe, while others stand on the platform and with a battering-ram drive the pipe into the ground until it will stand without help. The rotating device is then attached, and a combination drilling and pumping tool screwed to rods, is used as churn drill, the pipe being rotated simultaneously. While it is thus kept loose in the ground, it is sunk (1) by the weight of the pipe, (2) by the weight of the platform attached to the top of the pipe, (3) by the weight of the drill-men who stand on the platform, (4) by the weight of the rod and tool that the drill-men operate inside the pipe while standing on the platform, (5) by the jarring effect of the tool striking on the bottom of the hole. The weight of the crew standing on the apparatus sinks the rotated pipe into the ground; it causes a core to accumulate and the churning crushes and forces this core into the pump.

When filled, the pump is removed from the pipe and its contents emptied. The pump is again lowered into the pipe and the operation repeated. The contents are washed and the estimated weight and characteristics of the gold noted. These operations are repeated, lengths of pipe and drill-rod being added as required, until bedrock is reached. The pipe while being rotated is pulled from the hole by leverage. The apparatus is moved to another spot and another hole started as before. The drill acts like a combined core-drill and churn-drill, for the toothed shoe cuts a core and the drilling and pumping tool performs the work of a churn-drill and also pumps.

It should be kept in mind, while reading what follows, that the pipe, whether being sunk into or pulled from the ground, is always kept loose by rotation. This is one of the unique features of this and the Banka drill, and it is due to this circumstance that the sinking of the pipe into the ground and pulling of it from the ground are accomplished so easily. It is hard to sink and pull pipe when it is not being rotated. In placer drilling, all power churn-drills both sink and pull pipe by impact. This is the hardest work they have to do, and it puts a severe strain on the apparatus.

The full operation of ascertaining the average gold content, the volume or extent of the gravel, and its physical characteristics, will be described as follows: (1) obtaining the sample; (2) treating the sample; (3) amalgamating, parting, and weighing the gold; (4) ascertaining and recording the physical characteristics in the field; (5) calculating the value of each sample and the average gold content, volume of the whole deposit, and recording the field notes.

Obtaining the Sample.—The area to be sampled is surveyed and the points at which samples are to be taken are laid out in lines, staked, and numbered. The points, where the drilling is first done, are such as are supposed to give, preliminarily, a maximum of information with a minimum of work. The points at which further drilling may be done depend upon the results of this preliminary work. The number and distribution of holes necessary to ascertain essential data are governed by the characteristics peculiar to the deposit under investigation. When gold occurs regularly throughout the width and length of a deposit, the ground is divided into squares of from 250 to 1000 feet and a hole is drilled at each of the corners. This has been the practice in such ground as that of the Feather, Yuba, and American river dredging districts in California. When the gold occurs irregularly across the width, but regularly along the length of the ground, as in channels, the holes are laid out across it, either in lines that are far apart with holes near together or on lines that are near together with holes far apart. Holes are generally placed so that those of alternate transverse lines form longitudinal lines. They are then said to be 'staggered'. Regular spacing of holes is always to be desired. As an instance of the bad results of irregular spacing, holes were sunk close together, where preliminary drilling showed rich ground, and far apart where there was poor ground. This resulted in a falsely high average for the whole area, as was subsequently proved by dredging. Testing by drill was thereby locally discredited.

Preparing and Assembling.—The ground having been staked as described, the drill is hauled to the first point, and is there unboxed and assembled. An outfit to drill to depth of 25 ft. weighs about 2000 lb. and about 400 lb. for each extra 25 ft. drilled. It is usually shipped in about 10 packages. The drill can be sectionalized so that the heaviest piece weighs about 75 lb., and it can, if necessary, be transported on men's backs. As generally received, it takes about 2 hours to unbox and assemble the equipment. In addition to the outfit supplied by the manufacturer, it is necessary to have a battering-ram and pulling-lever, irons for which are furnished, as well as two poles to turn the pipe while pulling. These can usually be obtained near the place of drilling.

The Empire drill outfit includes the following: pipe, in 5-ft. lengths; cutting-shoes; pipe head; platform with rod-holders; horse-power appliance for rotating pipe; helical pocket pump; drilling pumps; rock-drilling bit; large and small auger drill-spoons; drill-rods in 5-ft. sections; 4 wooden sawhorses to support parts when not in use; 3 drill-rod wrenches; drill-

rod handle; pump-jar device; driving-cap; driving-ram; 2 pairs of chain-tongs; monkey wrench; Stillson wrench; ballpein machinist's hammer; 8-lb. sledge-hammer; 2 crowbars; cap, stand, chain, and lever for pulling; poles for rotating while pulling; gripping device; 2 pieces 1½-in. pipe, 6 ft. long, for lengthening wrench handles; cold, diamond-point Cape chisels; punch; assorted files; pick; shovel; axe; screw-driver; cross-cut saw; mixture of oil and graphite; brushes to clean threads; dump-box; 3 buckets; 3 tubs; dipper; hot-water tank and stand for frozen ground and cold weather; 6 gold-pans; gold-pan punched with ⅜-in. holes for screening; 3 concentrate dishes; magnet; 5 lb. mercury; phials; labels; forceps; annealing cups; nitric acid; alcohol stove; alcohol; retort-stand; magnifying glass; balance; note-books; tape; 2-ft. rule; cross-section paper; tracing-cloth; thumb-tacks; pencils and eraser; engineer's scale; drawing instruments; triangles; inks; lumberman's crayon; drill sheets.

After the parts are unboxed, the threads of the pipe, rods, and tools are cleaned and oiled with a

Driving Ram.

mixture of machine-oil and graphite, with just enough oil to make a thick paste. The rod sections are kept on two sawhorses, the pipe sections on two other horses; the tools are placed on two sticks of about 4 in. diameter. This is to keep everything off the ground, "to have a place for everything and everything in its place." These horses and sticks are placed just outside the circular path traveled by the horse in rotating the pipe, so as to have them handy.

Starting the Hole.—There are two ways of beginning the hole. When there is no overburden, or it is desired to sample the total gravel section, the procedure is as follows: A section of pipe is laid upon two sticks to keep it off the ground and to allow the use of chain-tongs without hindrance. A toothed cutting-shoe is screwed on. It must be kept in mind to use a small amount of oil and graphite on all the pipe-threads, otherwise it may be very difficult to break joints. The pipe used is extra heavy with special flush couplings. These couplings have coarse threads, about three to the inch, designed so as to screw up rapidly and not lock when in use. The necessity for oiling threads is obvious when it is remembered that the pipe sections may be set up very tight in hard ground by the horse pulling hard on the 10-ft. sweep. This is the same as making the joints with a 10-ft. wrench and a horse pulling on the handle. The cutting-shoe is 0.38 ft. outside diameter and 0.30 ft. inside diameter. It has an edge with teeth like a rip-saw, but

Drilling Frozen Ground. Notice Tank for Heating Water.

much coarser and made of very hard nickel steel, for its function is to cut into the material being penetrated.

The pipe-head is screwed on the other end of the pipe, but it is not necessary to screw it up very tight. It must shoulder, however, otherwise the threads will be damaged in driving. This pipe-head is designed to support a circular platform, 4 ft. 8 in. diameter, and has four recesses fitting into projec-

Drilling With Spring Pole.

tions on the platform. The five sections of the platform, namely the four plates and spider, into which the platform can be sectionalized for difficult transport, are bolted together. The spider consists of a crucible-steel casting with angles riveted to it. This casting is a little larger in diameter than the pipe-head, so as to permit the platform to slip over and on it without difficulty. The platform, which weighs 120 lb., is made of sheet steel, and angles:

perforated to lighten it, and the holes are so spaced as to hold the rod wrenches used in coupling and uncoupling, and rods and tools described later. This casting has two projections under the plate with holes to permit the sweep of the horse-power attachment to be fastened with a pin. Two rod-holders are screwed into pedestals bolted on the periphery of the platform 180° apart; these holders are made of 1½-in. pipe threaded on one end and on the other end provided with spring-steel jaws so made that the rods are easily slipped between them but cannot fall out. The section of pipe with the cutting-shoe and pipe-head attached, is erected on the surface of the ground, where the hole is to be drilled. This is held vertical by one man and then the platform is lifted over and slipped upon the pipe-head by the other men.

Driving the Pipe.—The driving-cap is placed on top of the pipe-head, where it projects through the platform and two men mount the platform. The battering-ram is handed up to them and they drive the pipe into the ground.

The driving-cap is a cup-shaped crucible-steel casting with a 1½-in. hole through the centre to receive the battering-ram pin. The battering-ram is a log used like a paving-ram with a wrought-iron ring on the bottom to prevent splitting. It has two handles made of 1-in. pipe, each end of which should project 12 in. from the log. These handles are placed about 30 in. above the driving end and the two pipes are at right angles to each other. This log should be 10 to 12 in. diam. and 4 to 6 ft. long, or it can be made like a paving ram, 14 to 16 in. diam. for about 3 ft., and 6 to 8 in. diam. for 2 ft. of its length respectively. It should weigh about 200 lb. A guiding pin may be driven into the centre of the driving end and fastened by a drift-bolt driven transversely through the log and through the pin. The pin must be securely fastened or it will become loose and fall into the pipe. The function of this pin is to guide the ram in driving and cause it to strike fairly on the driving-cap. This pin must project from the ram about 40 in. or its end may come out of the pipe at the time when in driving the ram is at its highest point.

As soon as the pipe has been driven a few inches into the ground, it requires less steadying; one more man then mounts the platform and assists in driving. Extreme care must now be taken to keep the pipe vertical, otherwise a crooked hole and subsequent trouble may result. When the pipe has been driven two or three feet, the ram and driving-cap are taken down. The horse-power attachment is then applied, the horse hitched to it and tied to the platform. The horse-power is essentially a structural-steel sweep, 12 ft. long. One end straddles the hub of the platform and is articulated to it by a pin. At the other end is a single tree and a wheel 12 in. diam. This wheel projects downward at right angles to the sweep and supports the outer end of the sweep.

Boring.—Sometimes, when the top material is barren, or it is not desired to sample it, the hole may be started by using the auger-drill spoon. As the name indicates, this tool bores, drills, and holds the material, even of the consistence of a stiff clay or hardpan. It has an auger point on a tapering barrel in the side of which is a slot, one edge of which is sharpened. The manipulations are as follows:

Before it can be used it must be screwed to a drill-rod section to which is attached the drill-rod handle so as to be at a height of 3½ ft. when the tool is erected and standing on the surface of the ground. The drill-rods are about 1 in. square and made in 5-ft. lengths with taper-thread screw-couplings. These couplings can be jointed and unjointed with less than three revolutions, and the threads cannot be crossed in coupling. By aid of the drill-rod handle the drillmen turn the auger-drill spoon or lift the string of tools, as the case may be. It consists of a crucible-steel jaw and two handles with a tool-steel locking and gripping device. Its construction is such as to permit rapid adjustment, attaching, or detaching, up and down, to and from, the rods, respectively.

The drill-auger spoon is manipulated like a post-hole auger and its construction is such that material is held in the barrel while being lifted out of the hole. When the ground is dry, a small amount of water is thrown into the hole to make the loosened material cohere and so not be dropped as the tool is raised from the hole. This tool, which can be made to penetrate roots or hardpan, by alternate lifting and driving it forcibly into the hole, and then turning, makes a hole large enough to receive the pipe at the rate of 10 to 30 ft. per hour. When material is barren and can be bored in this way, it is advisable to do so, for most rapid progress can be made. Sometimes in starting, a hole is shoveled to the depth of 2 to 3 ft. instead of doing as described above. The only precaution to be taken in working the auger-drill spoon is to keep the hole perpendicular. It is advisable to have two lengths of 1½-in. gas-pipe about 6 ft. long to slip over the ends of the drill-rod handle to give greater purchase.

Inserting the Pipe.—In case the hole has been started by boring or by shoveling, the pipe, to which the cutting-shoe and pipe-head have been attached, is placed in the hole, the platform put on, and the horse-power attached. All is now ready for drilling and beginning to take the sample. If the hole is dry, one or more buckets of water are poured into the pipe, for the pumps will not work unless there is water in the pipe.

Drilling.—The roustabout hands up the three rod-wrenches and a drilling pump to a man on the platform, who hangs the pump on a rod-wrench and lowers it into the pipe until it hangs suspended on the wrench resting on the top of the pipe-head. The rod-wrench is a forged-steel tool with an opening slightly larger than 1 in. square to fit loosely on the rods and squares on the tools. The rod-wrench has several uses: (1) as a handle and to raise or lower the tool or string of tools; (2) to suspend the tool or string of tools while hanging in the pipe; (3) to make or break joints in coupling or uncoupling the rod-sections and tools; (4) as a stop when making or breaking joints, by one of them straddling the

handle of the other and fitting through one of the holes in the platform, so preventing the first from turning.

A length of rod with graduations in inches is screwed to the drilling-pump and set up tight. This is done as follows: A rod-wrench is made to straddle the handle of the wrench, from which the pump is suspended, and at the same time to pass through one of the holes in the platform. A third wrench is then used to screw tight and set up the joint against the wrench, acting as a stop. When breaking joints, this operation is reversed. The drill-rod handle is now attached near the top of the drill-rod. The rod and pump are lifted off the suspending wrench by the drill-handle, the stop and suspending wrenches are then removed, and the string of tools lowered until the pump rests on the material in the pipe.

At all times the length of the string of tools in the pipe bears such a relation to the length of the pipe in use, that the depth of core in the pipe can be read by reference to the graduations. Thus, if there is no core, which means that the bottom of the pump is even with the edge of the cutting shoe, the zero mark of the graduations will be opposite the top of the pipe-head. For example, should the number 6 appear level with the top of pipe-head, it indicates that there are 6 in. of core in the pipe. On the other hand, should the zero mark drop below the top of the pipe and into the pipe-head, it shows that the tool is below the bottom of the pipe. This—drilling below the pipe—should be generally avoided, as it endangers the accuracy of the sample.

To resume the drill operations; suppose a considerable core to have been attained through driving the pipe and the depth of this core is read on the graduations and noted in the field-book. The horse is started and the pipe is thus rotated. At the same time, the men on the platform commence drilling by operating the string of tools, as in ordinary churn-drilling. The result of these operations is such that after 15 or more strokes, part of the core is crushed or drilled and forced up into the pump and held there by the valve. Simultaneously, the rotated pipe, being loose, sinks into the ground because of the weights of the platform and of the men on it; being assisted by the jarring due to the blow of the string of tools. The horse is stopped, the string of tools is raised and one rod-wrench placed on the square of the pump just below the coupling, thus acting as a support. A second rod-wrench is used as a stop by straddling as before, the third rod-wrench is used only to break the joint, while the unscrewing is easily completed by hand. The length of rod is lifted off and is stood with one end in the pedestal, and the other in the spring-steel jaws of the drill-rod holder. While one man is removing the rods, a second lifts out the pump and passes it to the roustabout, from whom a third man has taken another pump or tool, which he hangs on a rod-wrench and lowers into the pipe. The length of rod is again screwed on and set up, churn-drilling is resumed, and the horse is started as before. The roustabout carries the pump to the dump-box, into which he inverts it slowly until it stands on end. Usually the contents of the pump fall into the box and sufficient water is poured through and upon the pump to thoroughly wash it. It is frequently necessary to shake the pump in order to dump all the material. The coupling is dipped into water in order to remove all particles of sand and grit from its threads, and the pump is set in a convenient place.

The operation, as thus described, really carries the unique features of Empire drill apparatus, that is, the pipe is sunk by weight and by rotation with a horse, and a core is obtained, crushed or drilled, and pumped simultaneously. In ordinary placer prospecting with power 'rigs,' these operations are not simultaneous, but follow each other and each requires a change of heavy tools with diverse manipulations. Thus, first the pipe is driven to obtain a core; second, the core is drilled to crush it, so that it can be pumped; and third, the crushed core is pumped. These same results are simultaneously obtained by the rotating of the weighted pipe and the use of this special tool, the drilling-pump.

APPALACHIAN OIL DEVELOPMENT IN 1910.

By Raymond S. Blatchley

The Appalachian field includes the States of New York, Pennsylvania, West Virginia, and southern Ohio. Drilling in this region was only about half as extensive as the previous year, yet the new production held up remarkably well. This was due to increased activity in the Shinniston pool in Harrison county, West Virginia. In fact, West Virginia was the centre of new work for the year. Elsewhere steady development keeps up the usual annual yield. Several gushers were drilled in during the past 11 months.

The following table gives the new development by months, according to the *Oil City Derrick*, for the Appalachian fields, the average production of the new wells being given in barrels:

	Wells Completed.	New Production. Bbl.	Dry Holes.	Average of Productive Wells.
January	398	6297	122	22 9/11
February	359	3819	113	15 7/10
March	373	4481	124	18

*For first eleven months.

The Illinois Coal Industry

By Frank W. DeWolf

Several incidents of the year in Illinois coal mining have been without precedent. The strike, lasting from April 1 to September 10, opened the markets of the State to coal from Indiana, Ohio, West Virginia, and Pennsylvania, while miners suffered from hunger and mines from idleness and deterioration. Railways and large consumers thrived for a time on coal placed in storage in March, but the small consumer paid high prices all the time, and even the large users finally suffered. The Illinois Coal Operators' Association was all but disrupted, and the Walker faction of the United Mine Workers, though successful in winning the strike, apparently pulled farther away from the central organization and to this extent contributed to the growing friction. Despite the long period of idleness, it is likely that the coal production of the State for the calendar year will not fall far behind that of 1910. Illinois has probably lost second place to West Virginia. During the fiscal year* ended June 30, 1910, 48,717,753 tons was mined, in spite of the idleness of the closing three months. The figures are only half a million tons less than for the preceding year. Abnormal production in March in anticipation of the strike explains the large output. There are 881 mines. This industry required the labor of 74,634 men; some 350,000 people depend on it, directly, for support, and whole communities in 55 counties, indirectly so. It is an important revenue producer for 35 railroads. Since 1897 the output has increased 145%; the number of employees, 115%. In 1909, exclusive of the Cherry disaster, 213 men were killed and 894 seriously injured.

Notwithstanding its magnitude, perhaps because of its rapid development, the industry is not prosperous. Though daily wages are high and the mines are capable of producing coal at considerable profit, the average number of days of operation of the shipping mines in 1910 (fiscal) was only 171, so that remuneration to labor and to capital alike was unsatisfactory. Overproducing capacity has resulted in extreme competition and decline in profits. This is partly due to the anthracite strike of 1902, which created an artificial demand for coal and coal mines in the Middle West, and in part to the discovery of superior coal in southern Illinois where extension of railroad lines and the opening of mines has been rapid. The waste involved is enormous. Capital is tied up in mines for which there is no need; 70,000 men are employed but little more than half time, although 50,000 would amply suffice and be better rewarded, and 20,000 men would thereby be released to other vocations; the cost of production is materially increased by reason of irregular operation of plants; the tendency to centralize ownership of mines, as the weaker enterprises are wrecked, is unmistakable; the coal deposits can not be conserved when the pressure to control the cost of production is so insistent, neither can the physical condition of the mine, which involves the safety of the employees, be made what it should.

The strike of 1910 followed the failure of the Peoria Joint Convention of February 24, and the failure of the Joint Scale Committee to reach an agreement before March 31. Two weeks later the joint executive board of the miners and operators adopted an agreement covering emergency and repair work pending a final settlement of the difficulties. The Joint Scale Committee, in session at intervals, concluded that it could not reach a complete agreement, and referred the question to the second State Joint Convention which reconvened at Peoria, May 10. This second convention adjourned on May 20 without effecting a settlement. The miners were contending for an extra advance of 3c. per ton in the mining rate of Williamson and Franklin counties, and of 2c. per ton in the longwall mines of northern Illinois; also, for payment of the wages of shot-firers by the operators. The Operators' Association offered to advance mining rates 3c. per ton in all districts and to increase the price for day wages, dead-work, narrow-work, etc., 5.55%, as demanded by the Cincinnati convention of the United Mine Workers of America. Failing to reach an agreement, the convention adjourned on May 20 as stated. Four days later operators of the fifth district, representing 40 mines in St. Clair, Perry, Madison, Clinton, and Randolph counties, and of the ninth district, representing 32 mines in the same counties and the adjoining counties of Montgomery, Macoupin, and Bond, seceded from the Operators' Association and formed a district organization which promptly closed an agreement with the Mine Workers. Shortly afterward the Bunsen Coal Co., producing coal from a number of large mines in the Danville district for use of the United States Steel Corporation, also signed up with the miners. These movements came as a body blow to the Operators' Association, since it reduced their membership about 25%. Contributory to the settlement of the strike in favor of the miners was the existence of the Tanner and the Mitchell laws which prohibit importation of labor, and which also require miners to hold certificates of competency from county boards.

The strike threw on the operators the cost of shot-firers and increased the mining scale above that under which the Indiana mines operate. The differential in Williamson and Franklin counties still gives this region an advantage over the fifth and ninth districts. The operators feel that the failure of the miners to keep the agreement that hoisting engineers, pumpmen, and others necessary to maintain the welfare of mining property should work pending an agreement, was dishonorable, and renders future agreements of doubtful value. They feel that the fight between followers of T. L. Lewis and J. H. Walker makes factional politics of paramount interest to the miners, and brings about a sacrifice of principles important at once to the interests of miners, operators, and consumers. Mr. Walker's

*Fiscal year statistics are those published by David Ross, Secretary, Illinois Bureau of Labor Statistics, *Mining and Scientific Press*, November 26, 1910.

friends, on the other hand, feel that affairs were in such critical shape and the disruption of their union was so imminent, that self-preservation demanded the course actually followed. Naturally they are much gratified at the outcome of the long strike. The public at large is glad to note that a provision of the final settlement requires that in the future the question of scale will be taken up early, so as to permit a thorough understanding of the issues in time to prevent strikes. An effort will be made to complete agreements before March 10. Should this be impossible, a commission will then be appointed to sit until matters are adjusted. This will consist of 9 miners, 9 operators, and 3 disinterested men. It is interesting to note that J. A. Holmes, Director of the U. S. Bureau of Mines, is named as one of the three disinterested parties. Another agreement, that to arbitrate certain difficulties, is also commendatory. It is to be hoped that the present lack of harmony between the miners' factions can be arrested before further havoc is worked with the United Mine Workers' Association. A return to the condition of disorganization, carrying with it the inability to make group agreements, would certainly be deplorable. As a result of the strike, Illinois has lost some of its natural market. Splint and semi-bituminous coal from the East have acquired a foothold in the Northwest, and can only be displaced after considerable time, if at all. Production in the Northern Illinois fields, which naturally aspire to the market of the Northwest, has not regained normal volume. In the Southern field, on the contrary, the output during the four months since the strike, even making allowance for car shortage, has probably been above normal. Although railroad rates on coal have recently been raised, it has been a horizontal increase which still gives the Southern coalfields an advantage over Central and Northern Illinois in the competitive market.

Notwithstanding the somewhat disastrous year in the coal industry, legislative provision for study and revision of the mining laws is a sign of progress. The Commission appointed in 1909 presented to the special session of the Legislature in 1910 a number of comprehensive changes in the mining laws, including a requirement for installation of mine telephones, emergency gongs, fireproof stables, and fire-fighting hose. Most of the provisions have now been subjected to actual test, and have proved desirable. The law requiring installation of gongs, however, is regarded as a failure, and a provision for its repeal, together with new recommendations, will be presented to the Legislature convening in January 1911. The Commission created for the establishment of Mine Rescue Stations has been actively at work during recent months, and announces that the new Springfield station will be dedicated for active work early in January. Progress on the Benton and the La Salle stations is also satisfactory, and 15 sets of helmets and auxiliary apparatus, representing one-third of the total equipment, is now available for use in case of accident. The State rescue-cars connected with each station will probably be used to carry training to the mining camps, in case it is found that operators do not send their miners to the three central stations for training in rescue and first-aid work.

Few new mines have been opened during the last year, though a number formerly abandoned or closed on account of accident have been re-opened, and other new properties have been developed to their maximum capacity. This is particularly true in the vicinity of Matherville in Mercer county, and Norris in Fulton county. The Cherry mine has been re-opened to work the lower coal, but the workings in the upper seam are abandoned. The West Frankfort mine of the Dering Coal Co., which was the scene of a serious explosion, has been re-opened after an idleness of a year. Similarly, the Leiter mine at Zeigler, which has been the scene of several fatal explosions, has been entirely recovered and is being operated under lease by another company.

THE YEAR ON THE COMSTOCK LODE

Encouraging results have marked the course of development on the famous old Comstock in 1910. The Mexican and Ophir mines have been the scene of the principal operations in the Virginia City portion of the Lode; activities at the Gold Hill end are confined chiefly to the deep levels adjacent to the Ward shaft. During the year the water-level

C. & C. Shaft With Sub-Station of Gen. Elec. Co. in Left Foreground, Virginia City, Nevada.

at the C. & C. shaft of the Consolidated Virginia mine has been lowered from the 2350 to the 2650-ft. level, which is only a few feet above the bottom of the C. & C. sump. This has been accomplished by means of the Evans hydraulic ejector, which raises the water from the 2600-ft. level to the Reidler pump on the 2150-ft. level, which, in turn, lifts it to the level of the Sutro tunnel, about 20 ft. above the 1750-ft. level of the shaft. This has unwatered, not only the Con. Virginia, but also the Ohpir, Mexican, and Union workings to the same level, the 2600, there being open workings connecting these mines below the 2000-ft. level. The group of mines south of the Con. Virginia, including the Gould & Curry, Hale & Norcross, Savage, Chollar, Potosi, and some others, seem not to have been affected by the drainage of the Con. Virginia-Union group, there being no direct connection with them. Contrary to expectation, water seems not to have found its way along fissures, contacts, and other channels in the

intervening ground. The water-level in the great Combination shaft remains practically stationary, at about the 2000-ft. level.

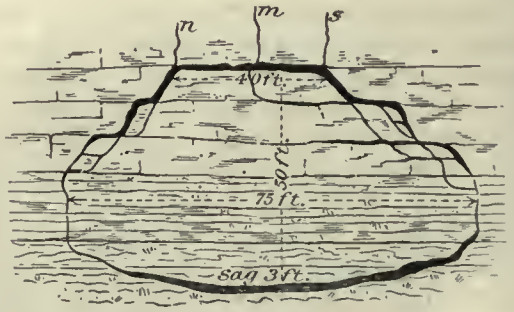
In the Mexican mine a vertical winze was sunk 500 ft. from the 2000-ft. level, and a level opened on a fissure in the east vein formation several hundred feet east of any of the old workings. A contact of the famous diabase dike with the earlier hornblende-andesite has been reached, and the diabase is found much altered, silicified, and mineral bearing, some excellent ore having been found. This ore occurs as a silicification and replacement of the shattered diabase, and is 40 to 50 ft. wide, and apparently is wider with depth, as demonstrated by development. The hope of the management lies in expectation of finding rich ore in quantity in this zone of mineralization, some very rich ore having already been discovered. During October the Mexican produced bullion valued at $17,000, though the November output was somewhat less, owing to lack of milling facilities, as the Butters plant was closed before the end of the month. This recent production of the Mexican is significant in consideration of the fact that the aggregate production of the mine in the previous 50 years had been but $2800, notwithstanding the fact that between $3,000,000 and $4,000,000 was expended in development during that period. A deep winze is being sunk in the Union mine on the 2000-ft. level, 1400 ft. east of the Union shaft, the object of which is to explore this east mineral-bearing formation in that property. This is 800 ft. north of the deep winze in the Mexican, and several hundred feet east of the line of contact, as developed in the latter mine. It is still in the diabase, which here shows little sign of alteration, though this is not unusual in the diabase where it occurs on the foot-wall side of an orebody, so there is no present indication of the proximity of ore in the Union winze, though it may not be far distant. There still remain many unsolved geological problems on the Comstock Lode, notwithstanding the hundreds of miles of development. One surprising thing, however, is that no mine manager has ever attempted to explore this east contact on the level of the Sutro tunnel, although there is every favorable 'sign,' except ore itself, where the tunnel crosses the contact. It would be well to run drifts both north and south from the Sutro tunnel along this contact. The probability is that such work would result in discovery of ore in both directions.

The Ward shaft on Gold Hill has been retimbered and is in good condition to the depth of 2475 ft. A pump-station has been completed at the 2100-ft. level, and a large electrically-driven Scranton pump installed there. At present it is lifting 2,000 000 gal. of water daily. A station is being cut at 2400 ft., which, when completed, will also be equipped with a large pump. Through the Ward shaft it is expected to recover the lower levels of the mines at the Gold Hill end of the Lode, and deep-level operations in the Yellow Jacket, and some others, are deferred pending the completion of the installations now being made, and the draining of the deeper workings.

Upper Mississippi Valley Zinc

By G. H. Cox

During the year 1910 the mining industry of the upper Mississippi Valley has been recovering from the great slump of 1908. There is now a spirit of conservatism that has never been seen before in the district. The irresponsible promoter, upon whose shoulders rests most of the blame for losses in the past, has left for greener fields. The true promoter which any mining district needs is still to be found, although most of the leases and purchases are now made by operators dealing directly with land-owners. During the past year leases were obtained by the payment of reasonable royalties and without the large cash bonuses required a number of years ago, before the property could be entered. Prospecting is now largely conducted in an intelligent manner by companies which already have producing properties. The price for drilling to the oil-rock has decreased from $1.25 to 75c. per foot, and the present employment of experienced drillmen results in excellent logs and samples. As usual in districts of this character, the tendency has been to mine the ore in the most rapid, rather than the most



Crevices n, m, s., Pitches and Flats, and Sag Characteristic of Upper Mississippi Valley Mines.

(From U. S. Geol. Survey.)

economical manner. It is generally considered that the mines are of too short life for any 'experiments.' The expansion of the larger companies has changed these conditions somewhat, and three lines of improvement are especially seen. In the first place, the shovelers are now paid largely by the 'can' and not by the day as formerly. While this has greatly increased the pay, it has nearly doubled the efficiency of these men and has made a saving of about one-third in the cost of loading and hauling the ore to the shaft; it also eliminates the former scarcity of such labor. In the second place, many of the operators, having experimented with various types of pumps, have reached the conclusion that the geared-lift pump, the old Cornish pump with its walking-beam replaced by gearing, is the most satisfactory and economical for the work of this district. There is, however, a tendency to increase the size of the column and decrease the number of strokes. In the third place, the Missouri style of mining the ore from one large face by the use of deep holes and large charges of powder has been introduced in a number of the mines with a considerable saving in the cost of excavation. The gen-

eral milling practice remains about the same as in past years. There has been a slight decrease in the amount of ore left in the tailing, and there is an interest in the possibility of decreasing the amount of fine and increasing the savings.

The Wisconsin and Illinois fields have been greatly benefited by the construction of an electric plant at Galena, Illinois, by the Interstate Light & Power Co. This plant is capable of developing about 5000 hp. and is connected by direct lines with the principal mining centres, at which points the current is stepped down and distributed to the various mines. So far, the introduction of electrical power has failed to lower the general operating expenses, but the following advantages are generally claimed by the mine operators: (1) decrease in the size and the installation cost of the plant; (2) the power is on day and night, except when it is necessary to stop for repairs; (3) it eliminates the difficulty of obtaining and storing coal for constant or intermittent needs. The Wisconsin industry is stronger than during the previous year. Numerous small companies have been organized, and the large companies have increased their holdings in view of future needs. This expansion has been especially by the Wisconsin Zinc Co., the Frontier Mining Co., and the Vinegar Hill Mining Co. Prospecting and mining have been carried on not as heretofore, but practically always with a care and consideration of geologic conditions. In Iowa, the Avenue Top mine at Dubuque is the only one that has been operated. There is, however, some prospecting and a small amount of ore is being obtained on the farm of Sam Strommy near Elkader. The ore production of northwestern Illinois has been limited largely to that from the Vinegar Hill, Hoosier, and Northwestern mines, which have been active throughout the year, and to the Unity, which started its mill early in the spring. During the past year prospecting has been carried on by the Vinegar Hill Mining Co. in the vicinity of the Vinegar Hill and Unity mines; on the property formerly known as the Pittsburg but now as the Great Western mine; and on the old Buck Hill range north of Galena. The Hoosier Mining Co. has been drilling to extend the outline of the orebodies of its mine and also on property one mile south of Galena. The Great Western mine has installed a gasoline engine, hoist, and pump, and is prepared to continue the sinking of the new shaft. The Ten Strike and Merry Widow mines, two miles west of Galena, have carried on development, and the former has produced ore. The Black Jack, Pilot Knob, Sheboygan, and Appleton mines have been inactive, and the last has been dismantled. The Royal Princess mine in the old California diggings has been kept dry and has seen some development, but has not been a regular producer. In the Elizabeth district the Kansas mine, which was running in 1909, has been closed, and the Skene mine plant has been dismantled. During the past year there has been no active mining in the Elizabeth, Stockton, or Morseville districts. In the vicinity of Mt. Carroll, at the extreme southern edge of the district, between 5000 and 6000 lb. of galena was taken from the farm of Judge Turnbough.

Gold Dredging in California

By Charles Janin and W. B. Winston

In 1910 there were 58 dredges in active operation in the State during most of the year. Two dredges were dismantled, one in Butte county, having worked out the property, and one old type dredge in Sacramento county, being no longer suited to the conditions under which it was required to operate. One dredge was shut down in Siskiyou and one in Placer county. Construction of four large 15-ft. bucket dredges was begun, one of which commenced operations in December. Also one 7-ft. bucket and one of 5 ft. were commenced. The following table shows the dredges operating at the end of December 1910, as well as those that were idle, dismantled, or under construction during the year. The counties and companies are arranged according to their relative importance in gold production and number of dredges operating.

In Butte county, Feather No. 3 dredge, which is

Gold-Dredging Localities in California.

under construction, will be put in operation during 1911 in the Oroville district on the north side of the river on property of the Natomas Consolidated of California. This dredge, which is being built by the Yuba Construction Co., and which will be the largest in the district, will be equipped with 15-cu. ft. close-connected buckets and will have a maximum digging depth of about 50 ft. below water-level and a capacity estimated at 350,000 cu. yd. per month. In Yuba county, Yuba No. 13, now being constructed by the Yuba Construction Co. for the Yuba Consolidated goldfields, will be equipped with 15-cu. ft. close-connected buckets and will be the largest gold dredge in the world, operating to a depth of 65 ft.

below water-level. In this district the Marysville Gold Dredging Co. began construction during the year on a new dredge, Marysville No. 3, which will be equipped with 7-cu. ft. buckets. The machinery for this dredge was in part furnished by the Union Iron Works. In Sacramento county, Natomas No. 8 dredge, which was constructed in 1910 and put in operation during the month of December, is equipped and contemplates installing a 9-ft. bucket dredge during 1911. In Calaveras county the Mokelumne Mining Co., operating on the Mokelumne river near Comanche, dismantled its old dredge early in the year and is now constructing a new hull for a 5-cu. ft. bucket boat. At the beginning of the year the Isabel Dredging Co., operating near Jenny Lind on the Calaveras river, changed hands and is now prin-

with 15-cu. ft. buckets and will have a capacity of 350,000 cu. yd. per month. Natomas No. 9 dredge, which is under construction, will be practically a duplicate of No. 8. Both of these dredges will operate on Rebel hill at the upper end of the district. They were constructed by the Yuba Construction Co., and will be the largest dredges operating; digging partly cemented gravel to a depth of 55 ft. below water-level. In this county the Union Dredging Co. has secured some land above Folsom

cipally owned by I. L. Borden, of San Francisco, the resident manager being F. J. Estep, under whose direction the dredge has had a successful year, many former working difficulties having been overcome. In Placer county the Bear River dredge has been shut down temporarily, and there are no dredges now in active operation in this county. In Siskiyou county, the Scott River dredge has been shut down, probably permanently, owing to difficulties in dredging on the slate bedrock. The Siskiyou dredge, be-

El Dorado county side of the American river at Cash Rock near Forest Hill. As far as can be learned there were no continuous-bucket elevator dredges operating in Trinity county during the year.

numerical strength of operating dredges the counties ranged as follows: first, Butte with 29 dredges, and a production of about $3,000,000; Yuba second, Sacramento and the balance in the following order:

Calaveras, Siskiyou, Shasta, Merced, Stanislaus, Placer, El Dorado, Trinity. Statistics for 1910 not being available, the production for that year is estimated as nearly as can be determined at this date at $7,500,000. The relative position of the counties in importance of production may possibly be slightly changed. The lead which has been maintained by Butte county since the beginning of the dredging industry in California, will be closely competed for by Yuba county, and the latter county will probably be in the lead in 1911. Much of the land in the Oroville district has been worked, and in general the dredging companies work their best land first, so it is to be expected that from now on there will be a gradual decrease in the production from Butte county. A steady increase, on the other hand, may be expected from Yuba, Sacramento, and several other counties, for some years.

All of the dredges constructed during 1910 are of the California type. With the exception of six small ones of the New Zealand type, all of which except the Baggett are working in ground not exceeding 15 ft. in depth, all dredges now operating in the State are of the California type. It is evident that this type of dredge has proved its superiority over others, and that it is eminently successful is shown by the constantly increasing gold production of the State from this source, although the richest ground in California has been exhausted for some time. There was a controversy some months ago in the London mining papers over the relative merits of the New Zealand and California types of dredge. The champion of the New Zealand type was a manufacturer of such boats and consequently possessed of some knowledge of the subject, though, as might be expected, he was prejudiced in favor of his own boats, upholding the open-connected buckets, and lead-line dredge, and contending, among other things, that the dredges developed and used in California were far heavier and consequently more expensive than was necessary. Such statements would imply that the dredge operators of the State were not progressive, were blind to their needs, and oblivious to all dictates of reason and experience. The first successful dredges in California were those of the New Zealand type equipped with open-connected buckets, head-lines, and short-tray tailing stackers, and for a number of years dredges of this type were used with varying success. When attempts were made to work deeper, and cemented gravel had to be handled, it was found necessary to install heavier machinery to withstand the increased strain, and the modern California type dredge with close-connected buckets, spuds, and belt tailing-conveyor was gradually developed after years of experimentation. This dredge embodies the ideas of successful operators and engineers who worked with and greatly assisted the builders in developing them. It should be recognized that where the ground is shallow and easy digging, or where the area is not sufficient to warrant the installation of an expensive dredge, a light well constructed boat may be advantageously employed. The strongest argument, and, in fact, the only argument that should be necessary in favor of the California type dredge is, that practically all dredge operators in California, who are constantly on the alert for better appliances, and who have spent much time and money in investigating and testing dredge machinery, have demonstrated to their entire satisfaction the superiority of the present California type, with buckets from 5 to 13½ cu. ft., both for yardage handled and for working costs. With these dredges it has been possible to work areas that even a few years ago were considered economically impossible as dredging ground. At one time there were about 28 New Zealand type dredges operating in this State; now there are but six, as shown by the table accompanying this article, out of a total of 69 dredges in California in 1910. These dredges are cheaper than the spud dredge, with close-connected buckets, and it is obvious that had not the merits of the latter been thoroughly proved the California operator would still continue to use those of the New Zealand type. The consulting engineer of a dredging company operating in Burma previous to contracting with The Bucyrus Co. for a California type dredge, carefully investigated the merits of the various dredges manufactured in England, Holland, France, Germany, and the United States. His decision after a thorough study of the subject was to select a Bucyrus dredge of the California type as best suited to practical purposes. It is also interesting to note the opinion of a well known New Zealand dredge engineer, who recently visited the California dredging fields, that dredge construction and operating methods in California are far ahead of those of any other country.

The Butte district is best known to the public as a copper camp, but its zinc deposits perhaps exceed those of copper. Zinc mining has been discouraging so far owing to the complex nature of the ore. The silver mines are also important, and gold, lead, and tungsten mines have yielded good profit. The Goldsmith, in the northern part of the district, is one of the biggest silver mines of the Northwest. Ore discovered recently on that property by lessees yielded about $18,000 per car shipped to the smelter. Practically all of the new mining properties which were in a favorable state of development during the height of the copper boom and were compelled to shut down when the panic came, are still idle. The most important of these are the Amazon-Butte, Pilot-Butte, Colusa-Leonard Extension, Butte & London, and Butte & Bacorn. All of these have good properties, but it will depend on the copper market of the world whether they will resume operations.

The Cripple Creek gold output to December 1, 1910, is $215,000,000, and of silver 1,035,490 fine ounces. The first gold taken from the district was in 1891, with a production for that year of $449; silver was not produced until 1893, when 5019 fine ounces was sent from the district. From 1891 on, gold production steadily increased until it reached a high mark in 1900, with $18,073,539, and since that time it has been as low as $10,913,687, in 1907.

Progress in Treatment of Gold and Silver Ores During 1910

By Alfred James

General.—It seems particularly appropriate that America should this year take pride of place in progress. During past years it has been customary to refer to the practice at Kalgoorlie, or New Zealand, or South Africa, as ranking highest. This year improvements effected by such men as F. C. Brown (Idaho), J. V. N. Dorr (Denver), A. Grothe (Mexico), and C. W. Merrill (San Francisco) have been more generally adopted, and it can scarcely be doubted that for advanced successful practice such mills as Philip Argall's at Stratton's Independence, Goldfield Consolidated, Homestake, Esperanza, San Rafael, Dos Estrellas, and El Oro, take precedence. Kalgoorlie, renowned some years back for its successful pioneer work in the treatment of telluride ore, appears lately to have been resting, and its main effort for the last two years would seem to have been the adoption in a few cases, mainly for re-treatment purposes, of the fixed submerged (Cassel) filter. But this position of calm by no means indicates that all difficulties have been overcome. On the contrary, metallurgical troubles are possibly more prominent in the Colony now than for some years past. One misses the battle-cries of the stalwarts, 'Roasting *v.* Bromo-Cyanide', 'Wet-Crushing *v.* Dry-Crushing', 'Tube-Mills *v.* Pans'. Since Robert Allen published his valuable work on Western Australia practice but little new has come to light except for an occasional thought-compelling article by M. W. von Bernewitz, whose contributions to current technical literature should surely be collected for future reference.

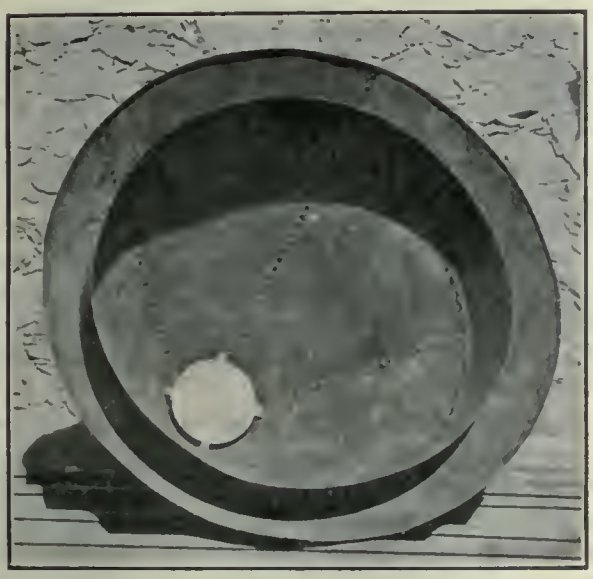
Africa still pursues its determined course of increasing the weight of stamps, although sound unshaken criticism shows no gain from such increased weight other than that resulting from the employment of fewer units. It has seemed to me that for the last three years Africa has been missing the point to which J. R. Williams and L. H. Diehl set themselves with such characteristic energy and carefulness, namely, the utilization of stamps for coarse crushing only, the finer comminution of particles being effected by tube-mill, and it has been apparently left to E. H. Johnson, of the East Rand Proprietary Co., to regain the laurels for the Rand in this direction by his work—referred to later—showing the advantage of increasing their present ratio forthwith from 2 to 10%. Even today the average duty of stamps on the Rand is less than that of the lighter stamps at the Giant in Rhodesia, and at the El Oro in Mexico—and there can be no doubt as to the toughness of the El Oro ore. The El Oro company indeed has been steadily showing the world for some time past how light stamps of under 1250 lb. weight can by the use of tube-mills be made to produce the heavy output above noted. Provided the tube-mills are not overloaded with pebbles, there seems no question as to the economy in power of such practice, and the better extraction resulting is undoubted. Recently, in a case where it was necessary to obtain the highest possible output with an amount of power severely limited, various schemes were tried, and finally the ratio selected as the most economical for this particular purpose was 6 tube-mills to 36 (1250-lb.) stamps, or 16.6%. This compares with the Waihi Grand Junction practice of 9 tube-mills to 40 stamps, the Santa Gertrudis practice of 10 tube-mills to 60 stamps (1550 lb.), the La Blanca practice of 6 tube-mills to 40 stamps (1250 lb.), and the El Oro practice of 14 tube-mills to 100 stamps (varying weights), and altogether surpasses the proportion of 7½% not long ago asserted by a Rand engineer to be the highest ratio in the world. The Rand has been considerably stirred of late by the introduction of the Butters filter. It must be considered a great personal triumph for its introducers. It promises to be even more widely adopted than the Adair-Usher process, and already, as a result of the operation of the plant at the Crown mine, installations are in hand for some other well-known mines of the district.

Rhodesia continues to pursue its own path of progress. First to set the pace in crushing with its 10-ton output at the Giant, it also appears to be the first actually to install and use 2000-lb. stamps, at the Bucks Reef, but its metallurgy appears to be conducted on more enterprising, though possibly more cautious, lines than that of the Rand; thus Pachuca vats are already adopted there, though the caution of the engineers is shown by their care actually to recover all their gold when once they have it in solution, and so two of the most recent plants, the Globe & Phoenix and the Lonely Reef, have installed the possibly to the American mind old-fashioned but safe Dehne presses, of which there is now quite a number of installations in that territory.

Eastern Asia has adopted air-agitation pretty generally, but is not yet altogether enamored of vacuum-filtration. A good general idea of the trend of practice may be gained from a perusal of Mark R. Lamb's recent excellent article in the *Engineering and Mining Journal*.

Concentration.—New methods of crushing have modified former practice, and the professional designer has now to face the problem of concentrating after very coarse crushing by stamps or after very fine sliming in tube-mills. E. Girault was able to deal with the problem characteristically and very neatly at Pachuca. Finding that his impalpably-slimed concentrate would yield to concentration, he crushed to a moderate mesh only (10 to 12) and installed Wilfley tables, which he uses as classifiers. He passes all his pulp over them and sends the concentrate to tube-mills, where it is ground with continuous return of the ground material to the Wilfleys until the latter cease to retain the impalpably-slimed particles, which are then in fit condition for cyanidation. But this simple method is unavailable when the concentrate has to be set aside for shipment or other special treatment, and in this case one has to face the loss in the pulp of comminuted particles which will not be separated out on the vanners. It

seems to me that to minimize such loss as would arise from the second grinding of already slimed concentrate particles it is desirable to adopt two-stage concentration: (*a*) tables for a sized product screened from the coarsely crushed (3 to 6 mesh) stamp-battery output and (*b*) vanners for the material from the tube-mills. The pulp for (*a*) could be separated out by Callow screens and then sized in cones for concentration as coarse and fine sand. Such a plant indeed may be seen in the Montana-Tonopah, but F. L. Bosqui in his later plant (Goldfield Consolidated) showed, it seems to me, no little daring and enterprise by boldly doing away with the tables and relying on vanners after tube-mills only. The decision must have required some courage and Mr. Bosqui certainly deserves credit for the successful working of his scheme. It is naturally to be anticipated that in his new sphere of labor, assisted and not hindered by local talent and experience, he will give a no less good acount of himself and be responsible for some fresh developments in African practice. Certainly the profession is indebted to him for his Goldfield Consolidated equipment.



Caldecott Diaphragm-Cone.

While on this subject of concentration, it may be well to add that Walter McDermott—no mean authority on the subject—makes the point that no table can be expected to compare with a belt for slime concentration for the reason principally that the concentrate once settled should not be disturbed until delivery. In spite of the real success of such tables as Deister No. 3, Mr. McDermott's point must be considered well taken, especially in view of the practice of slime concentration as carried out on tin floors, where ultimate recovery of high-grade concentrate is only possible by the settlement of the heavier particles and the surface washing off of the latter without disturbance of the former; a number of settlings and surface washings being requisite for ultimate success. A well-known authority in Mexico has discovered that his concentration costs him much less per ounce of bullion recovered than his cyanidation, and adds: "Experiments that I have made here lead me to believe that more profitable results can be obtained by thorough concentration and doing away with the cyanide process. You will see that *if* 85% of the metal could be gained by concentration, that method would prove more profitable than cyanide with a 96% recovery." I have italicized the 'if,' as that is just the rub. A small proportion of rich concentrate costs naturally but little per ounce, compared with the expense of cyaniding much lower grade material, but let him attempt to obtain from pulp of the same value (concentrate tailing) by further concentration, the same commercial recovery that he does by concentration, and his figures will alter amazingly. It is becoming more and more the practice for mines to treat their own concentrate on the spot. The cost of shipment plus charges, extras, fines, and deductions, is found to work out at a high figure, and even the Alaska Treadwell, which until recently owned its own smelter, is credited with saving $11 per ton of concentrate by the cyanidation on the spot.

Crushing.—The use of tube-mills has now become so general that there is but little to add to previous remarks on this subject. There has been no startling development in liners, which are mainly of silex blocks or of cast-iron pebble-retaining grooves, with local preferences for longitudinal bars or bolted plates. The reverse-screw in the discharge-end, first suggested by Walter Neal, is becoming more widely adopted as its advantages become known. As stated above, the Rand has been lagging behind Mexico and New Zealand in the number of tube-mills to stamps, but in his latest crushing results, E. H. Johnson, of the East Rand, has been able to obtain a 20-ton daily output per head from 80 stamps (1680 lb.) and 8 tube-mills, using a screen with 8 holes per square inch, with a final product of 90% through 90 (0.006-in.) mesh, of which 50% is treated as slime. Individual tests at the Cason and Angelo, East Rand Proprietary, show results of 23 to 25 tons per head with an estimated saving in power of 50%, and it is therefore proposed to equip the 220 stamps there with 22 tube-mills. On the other hand, as the *South African Mining Journal* points out (September 10, 1910), the Randfontein Central (Robinson group) is being equipped with 600 stamps and only 16 tube-mills for the same duty as the 220 stamps with 22 tube-mills mentioned above.

Dewatering and Classifying Pulp.—The wellnigh universal adoption of simple methods for effecting this object is possibly the greatest feature of the progress of the year. Reference has been made in these notes last year[1] to the Dorr classifiers, and now Charles Hoyle, at the Esperanza, uses a classifier which economizes height to an even greater extent than the Dorr and at the same time gives double the output. Mr. Dorr has modified his original gear and has a very cheaply operated and smooth-running machine. John W. Bell, at McGill, has a cone somewhat resembling the Caldecott, but with features of its own. It looks as if there may yet be a new conflict of 'Classifiers *v.* Cones'. At first

[1] *Mining and Scientific Press*, January 1, 1910.

sight the question is apt to be raised why classifiers, expensive in first cost and using power, should be used instead of cones, which are cheap and operate by gravity, but there is evidently a cogent reason, or the former would not be so extensively adopted. Probably a really continuous and automatic cone, which does not clog or require continuous adjustment, would readily win the day; which only shows that such a cone can not yet have materialized. For dewatering slime, the thickener suggested by Mr. Dorr is being widely adopted. Requiring but little space and little power for greater capacity, 30 or 35 ft. diameter by 10 ft. deep, and under 1 hp. for 100 tons of dry slime per diem, it has a variety of uses, so that it is difficult to predicate where its adoption will end. Used at present mainly for thickening pulp prior to agitation in Pachuca vats (Brown agitators), it is also convenient for use prior to vanners, not only delivering a pulp of the required thickness for most effective concentration, but at the same time, without pumping, sending to the vanner the necessary clear water for the operation (recovered from the pulp during thickening). A further use is the recovery of water used for sluicing away residue. This is a feature of the new Santa Gertrudis plant. While many thickening appliances have been referred to in recent years (see these notes for last year), no other seems so simple, cheap, and continuous as this.

Agitation.—The Pachuca 'tank' or vat continues on its path of triumph. The Transvaal is the latest country conquered, and in addition to the installation at French Bobs it is understood that the East Rand Proprietary is now putting in a number of them, while various modifications are also receiving much local consideration.

J. M. Nicol, in a criticism of these notes last year,[2] outlined a scheme, then in its infancy, suggested by A. Grothe and M. H. Kuryla (and J. L. Mennell?,) of continuous agitation in series in place of the use of each agitator as a separate unit, and this system has since been adopted at practically every new plant built in Mexico. It saves pumping, loss of level, and indeed is just the scheme for working these agitators in conjunction with the pressure-filters now coming so much into vogue, as the latter can be gravity filled, which makes the operation very cheap indeed. Mr. Nicol's criticism was so valuable, and his encomiums on the process so justified by its universal adoption, that I was content to bless the misunderstanding which evolved the criticism. I criticised a suggested process for treatment by continuous decantation in Pachuca tanks without filtration or any other method of recovering solutions from pulp. Mr. Nicol inferred that I was criticising the new suggestion of continuous agitation, *followed by filtration*, hence his valuable letter. The process I criticised is now as dead as the proverbial doornail; the method Mr. Nicol described will probably extend to the ends of the earth. There were two other criticisms of my notes. E. M. Hamilton[3] wrote to say that he obtained on the mines under his control results superior to those I ascribed to the fixed submerged filter. (Doubtless 'shortly' I shall be able to give the filter a definite legal name instead of risking the result of attaching to it any one of the seven names by which I have heard it described.) This is precisely what one would anticipate from one to whose professional work we are all so deeply indebted. Mr. Hamilton, I feel sure, would never countenance work on such lines as some of that which I came across, and I should like to confirm his remarks by adding that the best work accomplished by any filter of this type which I have yet seen in operation was that which I recently examined at a gravity-filled plant under Mr. Hamilton's professional supervision. There was another criticism, by Ralph Nichols,[4] who is remembered as the engineer that introduced to Kalgoorlie such up-to-date methods as the Moore filter and Merrill precipitation. Mr. Nichols will very possibly agree with me in stating that the possibility of channeling in the Dehne press—which up to date produces a greater proportion of the world's gold output derived from slime than all other filters and methods including decantation, and can therefore be considered a reasonably successful machine—not altogether improbable in a method of filtering by montejus formerly in vogue at Kalgoorlie, is much diminished, if not made entirely impossible, by the more recently introduced system of filling by pumps direct from the agitators and thus giving the pulp no time for that segregation in the montejus which led Herbert Moss to introduce air agitation as a corrective.

Recovery of Metals in Solution.—A casual observer who has noted the entire absence, of late, in the American technical press of the front-page announcements (regarding the great vacuum-filters) which used to amaze, or amuse, the public, must not thereby hastily assume that the day of vacuum-filters is over. May it not be rather that new processes or new fields are occupying attention formerly too highly localized or specialized? At any rate, Africa is paying a substantial and welcome compliment to the enterprise and business tact of one of the companies. But the fact remains that in the territory in which they have been mostly boomed, vacuum-filters appear to be suffering a setback. Pressure-filters are being widely adopted, particularly in the latest big mills, such as the El Oro, Esperanza, Veta Colorado, Santa Gertrudis, El Tigre, and El Carmen. At Guadalupe the Santa Gertrudis company had a prolonged and careful examination of the various prominent methods, ably carried out by Godfrey Doveton. The method of conducting these tests places the profession under no little obligation to Hugh Rose and the others concerned. The Moore (regular plant already in operation at the mill, the most recent one at that date at Pachuca), the Burt, the Merrill, the Sweetland, and the Kelly (at the outset only), were all represented, and the spirit of good-fellowship among the competitors would alone have made the test noteworthy. In the end the Mer-

[2] *Mining and Scientific Press*, February 26, 1910.
[3] *Mining and Scientific Press*, February 26, 1910.
[4] *Mining and Scientific Press*, April 2, 1910.

rill was adopted, with the Sweetland and Burt running very close in order of merit. As Mr. Rose justly remarks, however, conditions at Pachuca must not be held to be truly representative of any other conditions, and "a filter which is most suitable to our ores might be impracticable for others, and vice versa." The results of the tests are so interesting that I append a summary which shows how thorough they were. The total cost per ton of ore filtered, spreading the total cost and royalties, if any, taken for granted that because the re-washed feed to press assayed, for instance, 83.7 grammes Ag and 0.4 Au and the tailing as discharged 84 Ag and 0.4 Au, that therefore the press had made a recovery of over 99%. On the contrary, the discharged tailing was itself re-washed and the press debited instead of credited with any metal extracted during the process. This amount thus deducted varied from 0.5 to 4, and in one case 6 grammes per ton, or under 0.05 to 0.5% on the high-grade material

La Blanca Mill, General View.

La Blanca Mill, Concentrator Floor.

La Blanca Mill, Foundation and Framework.

over tonnage to be treated in five years, and including dissolved gold and silver lost, works out as follows:

	Cost, centavos per ton.	Dissolved metal lost, centavos.
Merrill	32.6	13
Sweetland	30.7	13
Burt	02.2	5
Moore	88.5	47
Butters	72.1	47

The full report shows the extreme care with which the tests were conducted. Thus, for instance, after determining the screen test, moisture in the feed, time and gauge pressure of cake-making; solution expressed; thickness, moisture, and weight of cakes, with the rate of flow during caking and washing; volume of wash, and of sluicing water; it was not tested. But even so, the recovery of the pressure-filters was very high indeed; approximating closely to 99%. In justice to the Burt filter, I ought to remark that the figure of cost in these tests, arising mainly from calculations necessarily based on a restricted output in the tests under consideration, must be regarded as quite exceptional and as not applicable to any other conditions. The extremely low loss of dissolved metal in solution is in keeping with the excellent work accomplished by this press at El Oro, where its cost of operation is as low as that of the Merrill at the adjoining mine, the Esperanza. Indeed, one of the most agreeable features of present North American practice is the decision of the owners of the pressure-filters that their presses are not invariably the best for any given ore and

that they will permit their presses to be installed only where suitable.

On the other hand, the vacuum-filters have not been idle. Butters can claim the great Dos Estrellas and Palmilla plants, while the Moore has two further installations at Pachuca to its credit, the Purissima and the La Blanca. A feature of the new Butters plant is the large pump and piping used for filling and emptying the filter-tanks so as to reduce the period available for the formation of cracks in the cakes. At the Crown Mines in the Transvaal the Butters engineers claim 0.12 dwt. residue, carrying 30% of moisture for 2d. per ton, which is remarkably good work.

It was a matter of surprise to me, after my experience at Waihi, to find the Mexican traversing filters were just as liable to the formation of cracks as those of the fixed-submerged type. They seem to manage things better at Waihi, and as the latter type of filter is supposed to require less acid than those used in Mexico, I have looked into the average costs and find that the cloths are cleaned once in every four months at a cost for labor and acid of 0.05c. per ton. This appears to confirm the above view. The Ridgway filters are working merrily along at the Great Boulder and elsewhere, but Ridgway, like every enthusiastic inventor, is busy at yet another filter. He is evidently anxious to have a new model with the washing capacity of the old type and the output of the new. But alterations of types scarcely make for permanency or for popularity. The Arbuckle process, with which persistent experiments have been made on the East Rand, does not yet appear to have been made a success, and it is rumored that the East Rand Proprietary is about to adopt the Butters filter.

Clean-up.—The substitution of Merrill presses for zinc-boxes has become more common this year, and the press has now gained a footing in Africa. At the Esperanza at the time of my visit (May 1910) the zinc-dust consumption averaged about 200 grammes per wet metric ton of ore, or about 3:1 of bullion. The precipitate carried about 60% of bullion and required no acid treatment whatever, but was simply melted down smoothly. The solution precipitated carried about 35 grammes of bullion per ton. It is essential to keep the press absolutely full of solution to prevent oxidation, and Mr. Hoyle, to whom I am indebted for much detailed information regarding improvements in Mexican practice, accomplished this by fitting a gooseneck to the discharge so that this reaches a higher level than the top of the press. In addition to all this, undoubtedly the substitution of a filter-press for all the paraphernalia of zinc-boxes and shavings gives a clean and neat practice, but to one who originally designed and first put into practice the type of zinc-box universally adopted over the world, the old-established practice would appear so firmly based as to not lightly be outplaced. But the scheme of J. S. Colbath, who was in charge of the well-run filter plant at El Oro referred to above, and incidentally the mine and business generally, whereby the use of a Merrill press was supplemented by a zinc-box, appeared to run smoothly to enable a much lower ratio of zinc-dust to be used (1:1) with consequent purer precipitate and less trouble in melting down. Mr. Colbath's idea, supplemented by his simple and efficient feeder the design of which he presents to the profession, is not to obtain absolute precipitation in the presses but to rely on a zinc-box to complete his precipitation. It might have been thought that as many zinc-boxes, though possibly with fewer compartments, would be required as before, since the amount of solution is the same, the press merely impoverishing it; but in practice one box seems absolutely affective; indeed, the precipitation appeared to be complete in the first two or three compartments.

Reference has previously been made in these notes to the failure of zinc-dust precipitation in Australia, New Zealand, South Africa, and India, but I admit that when face to face with an installation worked by experts, I am much more favorably impressed than with the results obtained by local enthusiasts based on information derived from written descriptions only.

Tilting furnaces are becoming more common. The practice of burning oil fuel in the melting-room without provision for the escape of the products of combustion to the outer air cannot be too strongly condemned. The old furnaces at Kalgoorlie were always connected to a chimney and no inconvenience was noticeable during fusing. The standard furnace runs with a consumption of about 120 cu. ft. of free air per minute at 45-lb. pressure, utilizing two Billow Atomizers Class F.M. and consuming 14½ kg. of Devoes' Brilliant oil per hour.

Among the prominent new mills of the year are the Bantjes (decantation), City Deep (2000-lb. stamps and decantation), French Bobs (Brown agitators, Butters filter, and Merrill precipitation), and Lonely Reef (Brown agitators and Dehne presses) in South Africa; and the Palmilla (Pachuca tanks, Butters filters, and Merrill precipitation), Veta Colorado (Pachuca tanks and Kelly filters), Carmen (Hardinge conical tube-mill and Kelly filter), La Blanca (Pachuca tanks, Moore filter, and Merrill precipitation), and Santa Gertrudis (Pachuca tanks, Merrill presses, and Merrill precipitation) in Mexico. The majority of these are not yet at work, although the Bantjes started some months since. In this case some tuning up seemed necessary, but this is natural to all new mills. (See an excellent article by A. W. Warwick, *Engineering and Mining Journal*, October 15, 1910.) The City Deep has not yet started, though the newspapers are crediting the 2000-lb. stamps as being designed for a duty of 9 tons each only. This is probably an error; the engineers responsible may be assumed to realize exactly the potentialities (expressed in these notes last year) of stamps of this weight. It is proverbially difficult to predicate from isolated examples, but it looks as though a high proportion of the new African mills will be designed for filtration instead of for the hitherto impregnable decantation, and that in the new Mexican mills the self-discharging presses will supersede the vacuum-filters in popular favor.

Revolutions and Mining

By T. Lane Carter

Not long ago there was published in the *Mining and Scientific Press* an interesting editorial on 'A Revolution in Honduras.' To those not acquainted with the Spanish-American republics, a revolution signifies the cessation of mining, and the stopping of all industry except that of fighting. Those of us, however, who have spent some time in these republics and have been in a revolution, know that they are by no means as serious to the mining industry as to the outsider, viewing events from a distance of 2000 miles and acquiring his information from the fertile and imaginative brain of a 'perspiring' newspaper correspondent. Of course, revolutions are not generally concomitant with successful mining, but in these Spanish-American countries you can usually keep running in spite of war's alarms. The greatest harm they do is to frighten outside capital.

There are times when a revolution means to improve mining conditions. Each party desires to stay on the good side of the foreigner, and frequently courts his favor by reducing taxation. Take, for instance, the case of the recent revolution in Nicaragua. Before Estrada and his following declared war against the Zelaya régime, the taxation on the mining industry was very heavy. One of the first acts of Estrada was to reduce the outrageous tariffs which Zelaya had placed on the imports consumed by the mines. The burden was cut in two by decree of the leader of the revolutionists. He also made himself popular with the mining people by abolishing a dynamite concession which had been given by Zelaya to some of his satellites, represented in Bluefields by the firm of Lopaz & Martinez. Not only was there a direct tax on every box of dynamite used by the mines, but a certain sum was paid on every box brought into the country and was appropriated by holders of the concessions. When the revolution broke out in Nicaragua the feeling among the majority of the people was that mining and other industries would have a far better chance than ever before. No one doubted for a moment that Zelaya and his crowd would be thrown out.

These revolutions interfere with the supply of labor. If the men at the mine had to choose between mining and fighting, there would not be many soldiers. The natives, however, are forced to join one side or the other. It all depends upon whether the revolutionists or the government recruiters reach the mine first as to whether the workmen become revolutionists or uphold the government.

After hearing rumors of an approaching revolution, the manager wakes up some morning at daybreak to find his mine surrounded by an armed force. These gentlemen have come to the mine to recruit soldiers from the miners. Their methods can not very well be designated as gentle. After a long parley with the recruiting officer, if you are diplomatic and suave, and have a good knowledge of the Spanish character, you may frequently persuade him to leave you one-half of your force. The other half of the miners marches off to the war, but you do not notice a martial air in the retreating forms. I have known of cases where a number of these volunteers would be sent down to the headquarters tied together with a long rope. With them there would be a note from the recruiting officer to the General in command, which would read as follows: "General: Please receive in good condition twenty volunteers. Kindly return the rope."

At one time I was in the wildest part of Spanish-America when a revolution broke out. I was the only American in the camp, none of my fellow-countrymen being closer than a two days' journey. The recruiting officer visited us early one morning and flashed a bull's-eye lantern into my face, saying, "You must join the revolutionists." When I told him that I was an American citizen there was not the slightest trouble as far as I was concerned. He obliged me by taking away only a small number of the men. My experience with revolutions in Spanish-America has been that the American who behaves himself has nothing to fear. There is a saying down there that if an American wishes to go to jail he must break in to get there. Of course there are exceptions. Cases of injustice are known to some of us, but now that the United States is giving more protection to the citizens in foreign lands there is a desire in these countries to give every protection to Americans.

Some mines are more fortunate than others. I know of one case in which the man in charge had twenty-four hours' notice that a revolution would break out, and that a press gang would be around to visit him to get volunteers. He simply whispered this news to the men, and the next day when the gang came out and surrounded the mine they found that nearly all the miners had fled to the thick forests.

There are some classes of the population in the Central American republics which escape military service when a revolution breaks out. In Nicaragua, for instance, the Jamaican negroes will not be taken away from you by the recruiting officers. These black gentlemen well know that the power of Great Britain is behind them. If they go to the wars at all it is because they wish to, not because they have to. If you ask the Jamaican what he is, he will tell you that he is a "British object, Sar." I do not know when he ceased being a subject. Another class in eastern Nicaragua exempt from military service is the Mosquito Indians. For many years the Mosquito coast was under the suzerainty of Great Britain, and when this section of the country was handed over to Nicaragua certain protection was promised to the Indians. It is because the Jamaicans and the Mosquito Indians are exempt from military service that every mine wishes to have a large proportion of these laborers. One-third Jamaicans, one-third Mosquito Indians, and one-third Spaniards, are the proportions aimed at. It will be seen therefore, that there are ways to keep a mine running in spite of the revolution.

The history of Central America for the last sev-

enty-five years is that of one revolution after another. Personally, I believe that the future outlook for revolutions and soldiers of fortune in Central America is bad, and, therefore, the outlook for mining in the coming years is much improved. The beginning of better times was noted when the republics, at the suggestion of the Mexican and United States Governments, reached a general agreement. Since this was signed there has been a great improvement in Central America. While it is still possible to have a revolution in a single republic like Honduras, it is now difficult to get up a general row. Honduras, for example, can no longer declare war on Nicaragua. Were it not for this agreement, there is no question but that Zelaya, in September 1909, would have involved all the republics in a bloody war. When it became known through the American ambassador that Zelaya had intentions of making war on other republics, the United States war vessels appeared off the coast

Map of Nicaragua.

of Nicaragua and thus averted a general outbreak of hostilities. Mining interests in Central America now feel sure that there will be no warring between the different republics. The next step will be to do away with internal revolutions in the individual republics, and make these turbulent centres as sedate as the Government of the United States. The outlook for peace is good and is growing better every year. Those acquainted with Central America know that there is a great difference between the republics. In Costa Rica, for instance, where revolutions are now unknown, mining and other industries are in a healthy condition. The populous republic of Salvador is also in a satisfactory condition. Probably Honduras is in the worst condition, with Nicaragua a close second, and Guatemala not far behind. The finances of Honduras are in a very bad state, but lately a proposition has been made to some leading American bankers to undertake the straightening out of the financial tangle of this unfortunate republic. Should this be done, the transaction will surely make for peace in Honduras. Nicaragua has just gone through one of the worst revolutions in its history. Zelaya, its evil genius, has been removed, and there is a feeling of relief in all the republics, just as there was in South America when the dictator, Castro, was recently removed from Venezuela. The new president of Nicaragua, Estrada, whom I have the pleasure of knowing, is most friendly to Americans and is eager to see mining resources of his country developed. The outlook for peace and stability in Nicaragua is therefore satisfactory. In Guatemala, mining is at a low ebb. The country has been a great silver producer, but at the present time the mineral output is insignificant. If Nicaragua were as well served with railroads as Guatemala, the gold output of the former would be materially increased. As a gold country, Guatemala is by no means as promising as Nicaragua. There are several districts, however, which will some day be big producers of silver, lead, and zinc. Mining and all other industries are much hampered by the unfortunate currency as well as the fear of revolutions. The fluctuations in the value of the paper money are so violent that the banks are at a great disadvantage. There is now a movement on foot on the part of some large financial houses to straighten out the currency problem of Guatemala. This will make for stability in the country and will aid mining as much as will the suppression of revolutions.

Those who have been to Central America and studied the mining possibilities there have been impressed with the vast undeveloped wealth of the republics. It is probable that the future history of the Central American countries will be a repetition of that of Mexico. Forty years ago there was no more discredited country in the world than Mexico. To get conservative capital interested in the country seemed almost impossible. By degrees, however, enterprising spirits undertook mining and other industries. Under the firm rule of Porfirio Diaz, huge sums of money have been invested there. In spite of the recent revolution in Mexico, even the most conservative owners of mining property have not shown any signs of panic. Their confidence in the future of Mexico is assured, and they state that they are convinced that a strong man will succeed the present ruler of the country. The enormous amount of capital that has come into Mexico has made for stability and confidence. By degrees capital will develop the Central American republics. The inter-republic wars are now done away with by the agreement entered into between the five republics. The increase in trade will make for stability, and in the course of years, revolutions will become as extinct as the volcanoes which overlook the Lake of Nicaragua. The completion of the Panama Canal will make these republics of far greater importance than ever before. The presence of the United States in Panama has already exerted an influence and will no doubt continue to make for peace. The troubles which face the miners and the capitalists in these countries are not overcome as yet, but the outlook is better today than ever before. Revolutions are, of course, always unfortunate, but I hope this article will show that their effects on mining in Central America are by no means as disastrous as would at first appear.

Iron-Ore Trade in 1910

By George H. Cushing

Placing the concrete facts of a given trade alongside the market gossip often produces striking contrasts. Unless prices are at top notch and collections easy, the trade gossip is inclined to be lugubrious. What is more to the point, the trade gossip correctly reflects the opinions of the traders, being gleaned directly from them. When it comes to the end of the year and there is an inventory, it may be found that a considerable increase has been made over the preceding year. The difference is not one either of tonnage or of profit, so much as it is one of disappointed hopes.

This philosophical and somewhat sophmorean introduction is inspired by the conditions existing in the Lake Superior iron-ore industry for the last year. From the opening of navigation last April to the close of ore shipments December 1, the persistent comment was that the business was far from flourishing. The carrying trade on the Lakes was unprofitable, because rates had to be held up by main strength. Furthermore, many of the bigger boats were tied to the docks for the better part of the summer. In the reports, the pig-iron trade has been languishing, with prices at rock bottom and no demand even at that figure. Furnaces were blown out and the influx of Southern iron was breaking the Northern market. In the steel trade, the buying has been practically nothing, because the railroads were harassed on one side by hostile legislation and on the other by the unfriendly attitude of the banks. This general slowing down of trade terminated the demand for coke before it began, and the coke-makers of the Connellsville district of Pennsylvania were beset to find a margin between production cost and selling price. Judging by the reports of the trade, the market has been awful.

Concrete facts are not so discouraging, especially for the ore shippers. They produced and sold within the season of navigation 42,620,201 tons of Lake Superior ore, compared with 41,683,873 tons for the season of 1909, giving them a gain of 936,328 tons. I submit that, considering the fact that this is a comfortable increase over the record year of 1907, and considering the business world is not fully recovered from the period of business depression, this was a splendid showing. Trade gossip will not admit it. The reason for that is that the ore shippers have been accustomed, in busy years, to jumps of 5,000,000 tons per annum in production, and feel aggrieved when their output falls a few thousand tons short of a million. Just the same, it is a question of disappointed hopes rather than an absence of real progress. Analyzing the figures of shipments, by ports, as compiled by the *Marine Review*, fails to bring out any peculiar significance. Previous years had shown, even on the surface, rapid gains in shipments through the ports from which come low-grade ores, and a decrease in the movement of the high-grade ores. To be specific, former years showed plainly that the Bessemer old ranges were falling off, while the Mesabi range was gaining. Broadly speaking, Escanaba and Marquette were losing while Two Harbors, Ashland, Duluth, and Superior were gaining. When a review of the chemistry of the year's shipments has been completed, it will probably show a further decrease in the average iron content of the ores shipped, but the surface indications do not show it. Escanaba shows a decrease in movement, but Marquette makes a corresponding gain. On the surface, the Bessemer old-range ores appear to have held their own, even though there has been a shift in the ports through which, principally, they are moved. On the other hand, Duluth and Superior seem to have made the largest gains; traceable, no doubt, to the increased shipments by the United States Steel Corporation from its own land. This fact may have something to do with the traders' comment to the effect that the market was dull; commercial mines may not have found so ready a sale for their ores as formerly they did. Exact figures to support this theory are lacking. It is a fact, however, that the Steel Corporation is developing its own lands in preparation for the opening, in vigorous form, of its new mills at the south end of Lake Michigan, at Gary, Indiana. The movement of boats, in increasing numbers, between the head of the lakes, at Duluth and Superior, and Lake Michigan points, may have had something to do with the difficulties in the way of giving ships employment at profitable rates. It surely was not a good year for either ship-owners or shipbuilders. The season started off early with no serious labor trouble, boats getting under way about the middle of April. The ore trade was then in a state of great expectation. The opening of the second half of the year was confidently expected to bring a full return of the period of business activity. The iron and steel interests wanted to be prepared for it and, regardless of certain stocks on lake docks and at furnaces, shipped down enormous quantities of iron ore from the head of the lakes. Iron trade hopes were indicated by the fact that the June shipment of ore amounted to 7,316,592 tons, which was a new record. The second half of the year failed to bring the expected trade revival, and the ore shipments began to fall off, the July tonnage being below 7,000,000 tons. There was a gradual letting down from that time, the reaction being especially marked after October 1. In November the slump became pronounced, and the movement was only 2,641,886 tons. At the end of November, ore shipments ceased absolutely, whereas a year ago a fair tonnage was moved in December. The influence upon the carrying charges was pronounced. Prior to the formation of the United States Steel Corporation Lake freight rates were peculiarly subject to the old law of supply and demand and were the subject of constant barter. For a good many years the freight rates had been around 90 or 95c. per ton, but with the opening of this century and the increased size of boats, there was a tendency for the rates to drop off to 85c. Then came one spectacular year—due to a quarrel between big inter-

ests—when the rates went up to $1.25. That was just prior to the formation of the Steel Corporation and was immediately followed by that company fixing a stable rate of 75c. per ton between the head of the lakes and Lake Erie ports, this rate including the unloading charge, as formerly. This rate has remained unchanged until this summer, when a renewal of the old bartering over charges was threatened. Owing to forceful persuasions on the part of a firm of powerful attorneys, the Steel Corporation consented to a maintenance of the old rates, even though, after the end of June, a good many boats went into ordinary. It was demonstrated, however, that owing to the increased size of the boats, the equipment of the docks with modern unloading machinery and the facilities at the furnaces for receiving and holding iron ore, it was possible to handle a vastly increased volume of freight with the same equipment. This has acted as a chill upon the shipbuilding industry for the time and has had a reflex effect upon the iron and steel trade. With more boats making the shorter run to Lake Michigan points from the head of the lakes and unloading at the splendidly equipped docks at Gary, this may be expected to increase rather than decrease. About the only offset is the promised demand for small boats to carry coal to the small and unimproved ports; this may give the shipbuilders some employment as the need for such boats has been strikingly expressed within the last season.

Looking broadly at the trade in finished steel products, the influences have been many and varied. It is now quite apparent that the big steel consumer, the railroad, has not been so greedy as upon former occasions, and this has not been altogether a matter of choice. According to figures compiled by railway experts, the carriers for the years 1908-9 were short in maintenance of equipment the tidy sum of $85,000,000 in round numbers, and enough more on maintenance of way to bring the total comfortably above $150,000,000. With that amount of assets taken from behind the capital, the bankers were not inclined to advance any more money for railroad development until that sum, which had been paid out in dividends, had been put back into the properties. This was hinted by George W. Perkins, of the firm of J. P. Morgan & Co. while upon one of his visits to Chicago. Obviously, there was but one way to obtain that money, and that was through an increase in freight rates. The various difficulties that have arisen, and which have so far prevented the increases from being made, are familiar to all. Since the railroads were without funds, they were not vigorous buyers of iron and steel; that is, they could not buy as much as the steelmakers hoped they would. Disappointed hopes led to the conclusion that the trade was extremely dull. What caused the rapid tumbling in values was the tendency of the steel and ironmakers to prepare for the expected demand, thus giving them facilities to far overproduce the actual demand. Thus, owing to the lack of balance, even temporarily, between supply and demand, the prices of pig iron ran off rather sharply, and No. 2 Foundry went as low as $12 at the Valley furnaces, with an average for the year of not over $14. This had an influence upon the production and sale of coke. The price started off vigorously, the producers reflecting the hopes of the steel trade. In the end, coke expressed the disappointment of the ironmakers, and as a result the prices went down to an equivalent of the cost of production, and, in some instances, even below that when sales were made on the spot market.

The Southern situation deserves, in this connection, one paragraph. Southern ironmakers, seeing the gradual exhaustion of the Bessemer old-range ores and the increased use of low-grade Northern ore, have been hoping for the time when their low-grade ore and open-hearth steel would give them an opportunity to command a certain share of the Northern market. In this connection, I am impressed with the tone of Southern comment of the last few months. A good many articles are being written calling attention to the freight-rate differential against the Southern ironmaker and calling for the Southern people to build at home a market for their home steel. This may be said to be one of the distinctive features of the year. Certainly it is a shift in sentiment which is significant.

At root in all this matter is the statement of the amount of iron ore shipped from the upper lake region. The figures, in long tons, are taken from the *Marine Review*, which makes a careful compilation, and are as follows:

Port.	November, 1909.	November, 1910.
Escanaba	701,646	452,351
Marquette	369,478	250,426
Ashland	600,469	276,612
Superior	758,073	635,002
Duluth	1,446,288	519,893
Two Harbors	1,023,266	508,062
Totals	4,899,220	2,641,886
Port.	To Dec. 1, 1909.	To Dec. 1, 1910.
Escanaba	5,632,421	4,959,869
Marquette	2,877,191	3,248,929
Ashland	3,736,744	4,093,822
Superior	6,505,527	8,437,261
Duluth	13,296,326	13,609,155
Two Harbors	9,116,150	8,271,165
Totals	41,164,359	42,620,201
1910 increase		1,455,842

Tin shipments from the Straits for the first half of December, according to cable advices of L. Vogelstein & Co., were 2080 tons, and for the second half are estimated at 2320 tons; total, 4400 tons. At this rate and allowing in the neighborhood of 3000 tons for U. S. deliveries, the visible supply promises to decrease about 1000 tons—practically a normal showing for a non-Banca sale month. If the Straits shipments are as small as expected there will be a decrease of 4000 tons for the year and a decrease in the visible of about 3000 tons. The price, however, which stood December 15 at 38c. as compared to 33c. last year, would seem to have discounted whatever favorable features there are in the situation.

Mining in the Belgian Congo, West Africa, in 1910

By Sydney H. Ball

The number of men employed in mining each year increases in the Belgian Congo, and though as yet this West African colony can scarcely be considered to have passed the prospecting stage, it at least gives promise of becoming a mining region.

The Kilo gold mine, situated in the northeastern part of the colony to the west of Lake Albert, is the only mine within the colony. This placer, worked by sluicing, is owned and operated by the State and employs about 28 white men and 2500 blacks. The production of this mine has been as follows, in ounces: 1905, 655; 1906, 6815; 1907, 10,545; 1908, 10,005; 1909, 21,085. In the first seven months of 1910 the production was about 2215 oz.

Katanga Copper Belt
Katanga Tin Belt

Scale approximately 1" = 430 Miles

more than that of the corresponding period of 1909; in 1910, then, the mine should produce about 24,275 oz. of gold. The State likewise is reported to be exploiting on a small scale gold-bearing gravels near Bokwama on the Aruwimi river. These deposits, while less rich than those of Kilo, will, it is believed, pay the high costs of mining prevalent in central Africa. At least one other State gold deposit will be opened up, probably by dredging, in the near future.

In the southeastern part of the Belgian Congo is the Katanga copper belt first mentioned by Livingstone. In 1900 the Tanganyika Concessions, Ltd., began developing this belt for the old Congo Free State (represented by the Katanga Special Committee). The English company holds 45% of the shares and the State 55. There are 1,000,000 shares (par £1, quoted in the middle of November at £6 15s.), of which over 750,000 have been issued in addition to £2,600,000 in 5% debentures. The copper belt is about 200 miles long and contains over 100 distinct copper deposits, some of which are of large tonnage. The country-rock is sedimentary in origin and consists largely of sandstone, sandy schist, and limestone. The ore developed is almost wholly oxidized and is high in silica. The railroad from Rhodesia to Elisabethville (formerly called The Star of the Congo) in the Katanga, near which point the Tanganyika Concessions Ltd. is to erect its smelter, was to have been completed by September 1, 1910, and should certainly by now be in running order. The railroad has spurs to The Star of the Congo copper prospect, the limestone quarries at Mikola, and the smelter which will be located on the Lubumba river near Elisabethville. Later this road will be extended to the Kambove copper deposit, 90 miles northwest of Elisabethville. A smelter is en route, part being at Beira (a port on the east coast, 1700 miles from Elisabethville), and part on the road up country. This smelter, which has a capacity of 900,000 tons per year, should presumably in another year or two begin to produce copper in greater or less quantity. It is reported that the blast-furnaces will use European coke, and the gas producers depend on local wood. Eventually fuel will be obtained, presumably, at Wankie, Rhodesia, at which point there is a large coalfield. The results obtained in the smelting of this highly siliceous oxidized copper ore will be watched with interest. Until the erection of the smelter, there will presumably be but little work done on the copper prospects. The Ruwe gold mine in the Katanga, which has produced over 10,900 oz., is not at present worked. This gold was obtained by sluicing a blanket of residual matter, lying down the slope from a tabular mass of indurated sandstone. This veinlike body is 1200 ft. long, averages 8 ft. wide, and assays $17 per ton in gold, silver, and platinum. The tin deposits to the south of Lake Kabele which have not as yet been exploited, are reported to contain 20,000 tons of tin.

The Société Internationale Forestière et Minière du Congo, a joint Belgian-American company, has at present 25 engineers and prospectors in Africa. This company has exclusive prospecting rights over some 500,000 sq. mi. of territory. Particular attention is being paid to the gold-bearing gravels at the head of the Tele river in the Aruwimi region. These, so far as tested, run over $6 per yard. A party is also drilling dredging ground at Kanyama in the Manyiema west of Lake Tanganyika. The Grand Lakes railroad has suspended operations on the Bamanga copper prospect on the Congo river below Ponthierville. This company has at present about 20 prospectors in the field; the Lower Congo-Katanga railroad has four prospectors, and the Lower Katanga Mining Co. fifteen. The latter company has staked out one tin and two copper claims. Considerable interest is shown in the fact that the companies operating in the southern part of the Belgian Congo at widely separated points have found some 21 small diamonds, many of them of good water. It remains to be seen whether or not diamonds will

be found in payable quantities. As yet no workable coal beds have been found, and the fuel problem is unsolved. Thin stringers of coal are reported from one locality in the Katanga, while thin seams of lignite have been found by the Great Lakes railroad prospectors to the north of Ponthierville. This contains volatile matter, 47.94%; fixed carbon, 45.09%; ash, 6.97%. In the same region bituminous shale carrying 80 to 100 litres of oil per ton occurs. Recently a concession has been granted to build a pipeline from Matadi on the coast to Leopoldville, the lower limit of navigation on the Upper Congo. If built, this may aid future mines. Wood, some of which is good for fuel, is abundant in most mineral regions, while hydro-electric power can be generated at most points where ore has been found. Indeed, few countries will be more benefited by advances in the application of electricity to mining and smelting. When the difficulties, inherent to a country situated upon the equator, are overcome, it is probable that the Belgian Congo will in the near future possess a number of important mines.

QUICKSILVER FOR 1910

By Fred L. Lowell

The quicksilver situation for the past year was in as unsatisfactory condition as in 1909, although there was a slight increase in production in the United States. This was from the New Idria mine of San Benito county, California. The price was quite satisfactory during the summer, but as the year drew to a close there was a tendency to decline. The surplus stock on hand in California has been nearly exhausted because of recent large shipments to the Eastern States, and as the mines are not showing any great increase in production, and no new ones have been brought to the producing stage, it would seem that the price of quicksilver should advance soon. The market for quicksilver is regulated in Europe, so it is a hard matter to forecast the price in the United States. The consumption of the metal in the Eastern States is for the manufacture of drugs, fulminate of mercury, pigments, and scientific instruments. Most of the production of the past year has been consumed at home, in Central America, Canada, Mexico, British Honduras, Costa Rica, Guatemala, Honduras, Cuba, Nicaragua, Panama, Salvador, Santo Domingo, Brazil, Colombia, Ecuador, Peru, and Venezuela, with small shipments to Korea and the Philippine Islands. The manufacture of fulminate of mercury in Canada would account for a good portion of this export, while Mexico imports considerable for her mining industries. The extensive work going on in the construction of the Panama Canal has caused a heavy demand for powder and caps and, with the large mining operations in the United States, has caused a demand for mercury for fulminate. Honduras also imports considerable metal from the United States. The advance of the cyanide process in the treatment of gold and silver ores has caused a decrease in the demand for quicksilver for amalgamation. The substitution of earth pigments for mercury in the manufacture of vermilion has also caused a decrease in the use of the metal, but the products from the cheaper substitute are inferior.

The main supply of quicksilver comes from the Almaden mine in Spain, the Idria in Austria, and the Monte Amiata in Italy, named in the order of their production. The market for quicksilver is controlled by the Rothschilds of London and Paris, according to the Government reports. They have not shipped any mercury to the United States during the past year. The tariff of 7c. per pound protects local production. Exports from the United States for the year 1910 amount to 120,413 pounds of a value of $76,938. The amount exported during the corresponding first six months of preceding years was as follows: 1907, 384,918 lb.; 1908, 224,692; 1909, 510,241. The exports for the year 1910 show a marked decrease. There were no exports from June to the end of the year, and there were no imports of the metal during the year, according to the Government reports.

EXPORTS FOR 1910

	Pounds.	Value.
January	6,845	$4,570
February	8,797	5,514
March	69,257	45,210
April	3,430	2,196
May	17,965	10,934
June	14,119	8,514
	120,413	$76,938

The New Idria mine of California, which is the chief producer of the United States, is credited with an increase of production, and a total during the year of 10,800 flasks of 75 lb., and the Napa Consolidated, owned by the same people, with 500 flasks. The New Almaden, on the other hand, showed a decrease. The Guadalupe has a slight increase, and the Oceanic produces about 50 flasks per month. The Helen is not a steady producer. The total production for the United States for the year will be close to 18,000 flasks, or about 1000 flasks more than the year 1909. There has been a big demand for quicksilver from the Eastern States during the last few months, and the shipments have been made by rail rather than by water, in order to save time in filling orders; showing that there is something stimulating the demand. There has not been any large deposit of cinnabar opened during the year, but there have been reports of ore being found in Nevada. No mines there have been brought to the producing stage. The Black Butte mine in Oregon does not produce any great amount of quicksilver, and the deposit is one of low content in the metal; in fact, most of the ores being worked at the present time in California or other parts of the States are below 0.75%. Those of the New Idria averaged 0.496% for the year 1909. The mines in the counties north of the Bay of San Francisco are not great producers at the present time, because the bodies of payable ore near the surface have been worked out, and the mines are shallow. A few prospects have attracted attention lately, one being the Chicago mine near the Helen. It is not yet producing large quantities.

Improvements in Silver-Lead and Copper Smelting—I

By L. S. Austin

The advance during 1910 in silver-lead practice has been in the line of improvements in blast-roasting and in lessening the annoyance of smoke. In copper smelting is noted a remarkable development of basic converting which bids fair to cause radical changes in plant and equipment and in range of practice.

Copper Blast-Furnace Practice.—No change has been made in the size of the larger blast-furnaces. From 48 to 56 in. is the width at the tuyeres, and the largest furnace is that at Anaconda, 86 ft. long. However, the 56 in. by 15 ft. blast-furnace of the Tennessee Copper Co. has been recently narrowed to 44 in., and with that width the furnace runs fast, at times up to 800 tons in 24 hr. This may be contrasted with former performance at Anaconda of 420 tons, or the speed at Garfield of 650 tons. The operation of the 86-ft. blast-furnace thus far has proved the soundness of its principle; it operates better, is more suited to changes in the charge, and more certain in operation than the short furnace. On the other hand, since its capacity is 3000 tons daily, it needs a large property to keep it going. Where possible, advantage has been taken of the heat-giving quality of sulphide ores, increasing their quantity in order to reduce the amount of coke upon the charge—that is, the substitution of sulphides for coke. Since the calorific power of iron sulphide is 2400 calories as against some 7000 calories for coke, it is to that extent less effective.

The slag-spouts of the furnace and the forehearth, instead of being left open as heretofore, are covered by protecting hoods lined with ganister. This effectually retains the heat and so keeps the spout open. The high blast makes a good deal of fine, part of which builds up accretions above the feed-doors, and this tends to obstruct the outlet to the off-take. It is barred off two or three times monthly. Fortunately, it is self-fluxing, and when it drops into the furnace, can be readily smelted without the use of extra coke. At the Tennessee Copper Co.'s plant it has been found that where the matte is made in two stages there is less loss of copper in the slag than where single-stage smelting is performed. Here are some results:

	First smelting, per cent.	Conc. smelting, per cent.
Cu	0.23	0.37
SiO_2	41.0	38.4
Al_2O_3	5.5	3.4
FeO	41.3	45.8
CaO	7.2	7.3
MgO	2.4	1.9

The first matte assays 18.3%, the second 35 to 40% copper. Such first matte might be directly blown to copper in a basic converter, and it appears, that where used, this is done without undertaking to concentrate further in the blast-furnace.

Flue-dust disposal has been managed for some time by pouring low-grade, or first matte, into beds about 18 ft. wide, the borders of the bed being made of flue-dust. Upon this layer of molten matte is spread more flue-dust. Another potful of matte is poured on this, followed by another layer of flue-dust, and thus successively until the mixture constituting the bed is 8 to 12 in. thick. The flue-dust becomes incorporated with the matte, and the solidified material is broken up and fed to the concentration furnaces. Lately at Douglas, Arizona, where the converter matte is re-smelted, this is poured from the slag-car into a hopper, or funnel, into which, at the same time, is run flue-dust. The slag and dust form into balls or nodules of various sizes and make an acceptable addition to the blast-furnaces. In this way the slag may be made to carry 20% of its weight of dust.

Both at the Yampa smelter, Bingham, Utah, and at the Balaklala smelter, Coram, California, the coke is fed by hand and separate from the charge, being shoveled in at the end-doors of the furnace. At the ends of the furnace the feed-floor is lower, so that coke can be dumped there. The end-doors are then opened and the coke added by shovel. At Coram, the furnace being 20 ft. long, the coke when fed to the middle of the furnace must be thrown a distance of 10 ft. In handling certain ores at Coram coke is fed from the side with the charge.

Flame Indications in Blowing Copper Matte.*—In blowing copper matte, there are four distinct variations in the appearance of the flame. At the commencement of the blow there is an oxidation of zinc, lead, and arsenic fumes, and a burning of the sulphur and of coal which has been added at first to the charge. This is indicated by a full red flame carrying white fumes which after two to eight minutes begin to show at the lower central part a green color. Then begins the slagging stage, the iron sulphide being actively oxidized and forming a slag with the silica present. The green in the flame becomes more and more prominent, and after 15 minutes of blowing is of a vivid apple-green color. After 40 to 45 minutes of blowing, flashes of blue appear in the flame. These increase, and finally the flame is of a white-blue, due to the formation of copper silicate. It is a sign that most of the iron is slagged off, and at the end of some 60 minutes the white-metal stage has been reached. The slag is now poured off, some sweepings of matte and rich slag added, the converter is turned up, and blowing is resumed. The blow begins with a vivid red-brown flame and smoke, but this gradually decreases and a thin red-purple flame with some thin smoke results, this continuing with slight change to the end. The end of the blow, or 'calling' of the copper is most difficult to judge, but, besides the flame, to the experienced man the emission of little shots of copper, which no longer stick to the hood, is a guide. The second period of the blow takes from 60 to 75 minutes. The paper referred to gives color illustrations showing the flame at the four periods.

Tooele Plant of the International S. & R. Co.—This reverberatory-furnace plant has been completed within the year and is now in operation. It is situated in Pine canyon, 4½ miles from Tooele Junction, which is on the main line of the San Pedro, Los Angeles & Salt Lake railroad. It is a compact side-hill plant occupying a space 1200 by 1300 ft., and is provided with seven miles of trackage. Its site was chosen so that it could be reached by a four-mile Bleichert tramway from the Highland Boy mine, Bingham. Smoke abatement agreements and options on adjacent lands were also secured in order to do away with the chance of damage suits and injunctions. The ore is put into receiving bins having a capacity of 3000 to 4000 tons. From these it is drawn upon conveying-belts which carry it to the crushing and sampling mill, all the ore being crushed to ⅜ in. for reverberatory treatment, since no blast-furnaces are used. There are four rows of 16-ft. diam. McDougall roasting-furnaces, eight in a row, 32 in all, whose combined capacity would be 1200 tons daily. The gases from these roasters, on their way to the stack, pass through a dust-chamber 140 ft. long, 120 ft. wide, and 30 ft. high. The cross-sectional area of the flue (3600 sq. ft.) results in a slowing down of the current to about 1 ft. per second, and this allows of an effectual settling out of the finest dust.* The chamber has a skeleton steel frame with curtain walls and thin flat-arched roof. Thus the frame is independent of, and does not rest on, the walls, giving proper stability and permitting of expansion without injury to the structure. The interior I-beam posts are cased in brick with an air-space. Air enters the air-space at the foot of the posts and escapes within the flue at the top, thus keeping the columns cool and free from corrosion by the fumes. The flues have three rows of hopper-bottoms and are built on four parallel foundation walls set 25 ft. above the roaster-house floor. This gives ample space beneath for drawing off the flue-dust into cars which run beneath on three tracks. There are five reverberatories, with room for two more, each 102 ft. long by 19 ft. wide. To supply them three lines of track run over the furnaces transversely, one line over the fire-boxes, and two lines for ore, these latter so placed as to charge the ore near the bridge end. At the front of the furnace are two tracks set in a tunnel 17 ft. lower than the hearth. Slag is tapped into 20-ton slag-cars standing on the nearer track. The other serves for cars into which flue-dust from the reverberatory flue may be drawn, this flue running along the edge of the tunnel. Each furnace is equipped with a single waste-heat boiler of the Stirling type. The five waste-heat boilers give sufficient steam to generate all electric power needed at the plant. There are in addition three 250-hp. coal-fired Stirling boilers used for starting up or for a reserve. At the back of the fire-box end of the reverberatories run two tracks set 25 ft. below the furnace hearths and at the level of the converter-floor. The nearer track is for the cars which take away ashes, the farther one serves the converter building. Since the reverberatory building is separated only by a partition wall from the converter building, the matte from the reverberatories can be tapped and run by launders to the converters at a distance of only 60 ft. Provision is also made for tapping the matte into ladles and taking it to the converters by traveling cranes.

The Basic-Lined Copper Converter.—Kelly tried converting in a basic-lined converter in 1890, and Heywood has given his experience in 1906 at Butte with the Baggaley converter. Pierce and Smith, after much experimental work, brought basic converting to a successful issue at Baltimore, and took out patents on certain details of converter construction. The shells are of ¾-in. plate, 26 ft. long by 12 ft. diam. and are lined with magnesia bricks in varying thicknesses up to 18 in. at the tuyeres and 9 in. near the upper part or throat of the converter. There are 32 Dyblie tuyeres, but opposite the outlet or throat these are not used, since it is desired to run as quietly as possible. The converter is carried on three riding rings which rest on trunnion wheels. The throat 40 in. diam. and 30 in. above the shell is of sheet-steel lined with clay or magnesia brick. In the tuyere region the brick are replaced by a ganister of magnesian material mixed with a binder such as linseed oil or water-glass. This insures a lining which is tight against air leakage, and which can be repaired by openings placed opposite the tuyeres and by which ganister is introduced to repair around the tuyere openings. Beside the throat opening is the breast closed with clay and magnesite brick. This has two tap-holes, the upper for slag, and the other, immediately below, for the matte. To allow for the expansion of the magnesia brick, a ¼-in. liner is placed in each fourth longitudinal row of brick. In the original patent the shell was parted above and was tied by strong rods which could be adjusted to the expansion. Longitudinal expansion was taken by I-beams also tied by rods which strengthened the head. The tuyeres themselves were packed with lead or asbestos to allow for movement due to expansion, and the air from each tuyere was carried by a cast or wrought-iron pipe through the 18-in. lining. However, these difficulties of expansion appear to have been exaggerated, and at Anaconda were ignored.

In operation, an initial charge of 30 to 40 tons of matte is poured into the converter and this followed by about 3 tons of silicious ore, and the blowing started. The blast-pressure is gradually in-

*Experiments on the rate of settling of blast-furnace dust made at the Copper Queen smelter, Douglas, Arizona, confirm this. With a speed of 4 ft. per second fully 90% of the dust that settled in the experimental chamber passed a 200-mesh screen, and it was found that the chamber need not be long for effectual settling. In this, L. D. Ricketts' experience agrees, he having found under such conditions a loss in some tests of 12 lb. per converter hour. To collect the dust he will put in a chamber where a velocity of 4 ft. per second of the escaping gases will be attained. This will settle the heavier dust, containing as much as 17% Cu, while the portion too light to settle at this velocity, containing an abundance of zinc, together with considerable lead and arsenic, and with but 2% copper, will be got rid of. Here is a case where a bag-house would be an actual detriment.

creased and blowing continued 30 to 45 minutes until the silica has been fluxed by the iron oxide forming. Slag is now poured and a ladle of matte (7 or 8 tons) added. This is followed by another charge of silicious ore, blowing resumed, and the resultant slag poured. This is kept up with smaller additions of ore in the later charges until the converter is filled with 'white metal' or even 'pimple metal'. Additions of matte and silicious ore are now discontinued and the charge blown to copper. The slag produced should not be lower than 25% SiO_2, since below this figure accretions of magnetic oxide of iron form. A fair average slag would go 26.6% SiO_2, 43.2% Fe, and 1.6% Cu. The cost of relining after a shut-down of two or three weeks would be $250 to $300, which would figure out 12c. per ton on a fair estimate of 2800 tons of blister produced on one lining. The converter drives so quietly that it seems to work slowly, and there is little or no foaming in the first stage. This is due to the gradual additions, and because the slag is poured off at short intervals. Nor is there foaming in the second stage or blowing to copper unless the charge becomes too cold. The tuyeres are harder to keep open than in acid converting, and need the constant attention of two men who use 1¼-in. punching rods in place of the ¾-in. ones. At Anaconda basic converting has been undertaken, using the ordinary vessels, and with a high degree of success, following along the lines found best at Garfield. The matte is of higher grade than at Garfield, and the silicious-ore additions consequently smaller, some of it being put in even before the first ladle of matte, then more ore after the matte is charged before beginning the blow. One may notice in the practice in both places that additions when finishing to blister are not needed, and if such an addition is made at all, it should be of white metal and not of the ordinary sweepings or 'dope.'

The advantages of basic as compared with acid converting are: (1) Lower cost of plant and equipment, since there is no need of the relining plant, and the converter building can for the same output be smaller, and, because of the use of lighter cranes, of lighter construction. (2) There is no handling of the converter vessel, hence large ones can be used. On the other hand, one converter must be kept in reserve. The converter is more continuously in use. (3) No clay is needed, since the lining is comparatively permanent, and the acid material need not be so silicious as when needed for a lining. (4) Less slag is produced and this is low in silica, that is, the silicious additions go further. Hence there is less for re-treatment and less copper going into it. (5) Low-grade matte can be treated as readily as high-grade, and there is no limitation in this respect. Of course, such matte can also be concentrated in a blast-furnace, but at a greater expense.

The disadvantages of basic converting are: (1) Fine silicious ore is blown out of the converter; indeed, the closing off of the tuyeres opposite the throat is to lessen this difficulty. (2) Accretions form at the end of the converter where the ore is charged, but this trouble will be overcome when the converter is so constructed as to have the throat at the middle of its length, not, as now, near the end. (3) Extra care has to be taken in working so as to avoid early burning out at the tuyere-zone, and extra tuyere punching is needed because the converter is run colder. (5) Time is lost in relining, and the lining itself is expensive. (6) Finally, it appears that in certain localities there may be a distinct disadvantage in using the basic-lined converter, and many where it would be more profitable than acid converting. Thus when there is a source of profit in the clay-binder, then acid work may pay; where barren clay only can be used and when the ore is not particularly silicious, then basic converting is indicated.

Converting Leady Copper Matte.—It has been long held that in attempting to convert leady copper matte made in silver-lead smelting, there was bound to be a serious loss of the contained silver, which was carried off when the lead was volatilized. But at Aguas Calientes it was found when a bag-house had been put in and all the fumes had been collected from the converters, that the loss of silver could not be more than 0.5%. This led the same company to install converters at Omaha, and these have been in successful operation there since 1905. At Perth Amboy basic-lined converters have been used successfully, and 1000 tons of copper bullion has been produced on one lining, and at a lower cost than with the converting of copper matte. At first a great deal of trouble was experienced at the bag-house from the destruction of the cotton bags by sulphuric acid. During the first blow the zinc and lead oxide fumes would neutralize the sulphuric anhydride, but at the second stage, if the charge was cold and foamed in consequence, there was a formation of the acid which attacked the bags. It would appear that the SO_3 must be formed from the SO_2 by decomposition at temperatures of 380° to 700° C., in the presence of catalyzers such as the flue-dust composed of copper oxides and sulphates, or iron oxides. Now by the admission of abundance of air, the hood gases may be cooled down below 380° C. and thus escape catalytic action. Cooling fume for introduction into bag-houses involves some unsolved problems in radiation. At the Mammoth plant in California it was found that much more radiating surface was necessary in practice than had been estimated on the basis of best available data.

Introduction of Silicious Ore into the Converter.—The idea of putting silicious material directly into the converter to flux the forming ferrous-oxide is not new, but the plan was abandoned in favor of the idea of borrowing the silica from the lining. As a result, the life of the lining is brief, after which the exhausted shell must be removed, cooled down, and re-lined. Within a few years, however, it has been found possible to make some silicious additions just before the matte was charged. This material would adhere to the hot semi-fused interior and served well to furnish some silica. With the coming in of basic converting, there was no choice but to add all the silicious material during

the blow, even though there was some dust loss from the finer ore thus added. I may add that such addition, where the throat of the converter is near the end of the shell, has resulted in a building up of unfused or partly-fused ore at that point, which tends to obstruct the throat, and which has to be removed. Now Arthur M. Day has revived, with a considerable degree of success, an old idea by blowing in the silicious ore through the tuyeres. In theory this would seem the best way to do, since, while the ferrous oxide was forming from the matte, it would be at once brought in contact with the silica. Broadly stated, the idea is to blow pulverized ore into the converter under high pressure through one or more of the tuyeres, made a little larger for the purpose. Plenty of material can be blown in in this way. Thus far the process is in the experimental stage, but some satisfactory slags have been made. On an acid-lined converter a slag has been produced that carried 43.6% SiO_2 and 46.1% FeO, while in the basic-lined converter a slag that carries as low as 10.2% SiO_2 and as high as 77% FeO has been made. In fact, it has been possible apparently to produce a slag of any desired composition. The latter slag could have no corrosive effect on a basic lining, and would be produced with the minimum of silicious ore and of resultant slag.

WORLD'S DEEPEST MINING

By J. Parke Channing

In the course of some professional work I have just had an opportunity of going into what is probably the deepest underground workings in the world, if we except the central section of the Simplon Tunnel, which I believe is some 8000 or 9000 ft. below the summit of the Alps. To the Tamarack mine, now practically a subsidiary of the Calumet & Hecla Mining Co., belongs the credit of having the deepest shaft in the world, and the deepest underground workings from which mineral is being extracted. No. 5 shaft crosses the Calumet conglomerate, at a depth of 4500 ft. measured from the collar of the shaft, and is now down to a depth of 5273.5 ft., it having at that depth cut the Osceola amygdaloid, and passed through it. It is interesting to note that at the upper portion of this lode considerable native copper was found. In a short time this shaft will be extended at least ten feet farther, in the cutting out of a sump, thus making it over a mile in depth.

No. 3 shaft of the Tamarack has been sunk to a depth of 5222 ft. The collar of this shaft, however, is 31 ft. higher than that of No. 5. This No. 3 shaft crosses the Calumet conglomerate at about 4650 ft. At the so-called eighteenth level, a cross-cut driven 800 ft. to the west, reached the lode at a vertical depth of 5181 ft., from which point a slope has been sunk 300 ft. to the twenty-first level, below which there is a sump of 7 ft. The bottom of this incline is 5368 ft. below the collar of No. 3 Tamarack shaft, measured vertically. The Calumet conglomerate dips at an angle of approximately 38° to the west, so that measured on the incline this point is very nearly 9000 ft. from the outcrop. At this point the lode looks fairly good, and is sufficiently rich to warrant its extraction and treatment.

The longest inclined shaft in the Lake Superior copper country is No. 4 Calumet shaft of the Calumet & Hecla Mining Co. which is down to the eighty-first level, this being approximately a distance of 8100 ft. along the slope, at an incline of about 38°. As showing the strong belief as to the persistence of the various lodes in Lake Superior in depth, and the possibilities of extracting copper at a profit, the Quincy Mining Co. has lately purchased, for $600,000, from the Canal company, a tract of land lying to the west of its own property, and which will not be reached by its present workings until they are at least 7000 ft. in depth measured on the slope.

As has been previously published, the rate of increase of temperature in the Lake Superior copper mines is not excessive, the rock temperature at a depth of 5000 ft. vertical being approximately 90° F., and if proper means of ventilation are used, there is no difficulty in operating at this depth. If, however, proper connections are not made, the air becomes excessively humid, thus materially reducing the efficiency of the miners. The mechanical difficulties in mining at these depths consist in the necessity of keeping the timber close to the working faces because of the great pressure due to superincumbent mass of rock, and the method of mining now used is similar to the long-wall retreating method of the coal mines.

When it comes to hoisting-ropes it is impossible to keep the same high factor of safety as in shallower mines, this factor being often reduced to 3.5. This, however, has led to no serious consequences other than that of some increased expense because of the necessity of more frequent changing of the ropes, so as not to keep them too long in service.

It is fortunate that in the Lake Superior copper mines, after getting down below the fractured-surface zone, practically no water is found. On the lowest levels of the Tamarack mine the only water visible is a slight seepage which is extremely bitter to the taste. Analyses of the water made by local geologists have shown the presence of chlorides and bromides of sodium and magnesium. There has been considerable discussion as to the origin of this water, some thinking it is the remnant of pre-historic ocean waters, and others believing that it is the water which deposited the minerals. However, from a practical point of view, the fact is that these mines, at the deepest levels, make only a little more water than is necessary for the use of air-drills. No pumps are installed in the mine and the little excess of water is bailed out once a week, or oftener.

There is, of course, a gradual decrease in copper contents of the rock as depth is attained, which has been made up for by increased efficiency and improved methods. It is a fact in biology that no organism develops beyond the needs of its immediate environment, and it is plain to see that this same rule exists in mining.

American Progress in Cyanidation

By An Occasional Contributor

Each year sees a marked increase in the percentage of the world's precious metals recovered through the agency of cyanogen. In the early days of the cyanide process, the opinion was prevalent among metallurgists that the successful use of cyanide would be confined to a few special instances where all other means had proved to be futile and where the physical and chemical natures of the ore were particularly favorable. Today practically the first questions asked when attacking the problem of treating gold-silver ore, are, what extraction can be attained by cyanide, and the cost of making it. It is only after these conditions are shown to be unfavorable that the possibilities of other processes are considered. As in the history of most of the other arts, the first years of cyanidation saw improvement follow improvement in such quick succession that there was great trouble in keeping pace with the march of progress, but as time went on, these improvements became less spectacular until today changes are more refinements of existing features than anything positively new. There are now plants that have attained a remarkably high degree of metallurgical perfection.

As has been the case for several years past, Mexico has led this year, though mostly through the efforts and ability of Anglo-Saxon engineers. Several remarkable new mills have been put into service there during the past twelve months, and several more are to follow in the first months of 1911. The flow-sheets of these new mills show that the 'Pachuca tank' will be used in almost every one. It is rather curious that although this was the invention of F. C. Brown, of New Zealand, it is used scarcely at all in Australia. A striking innovation has been made by the introduction of the continuous system of agitating which has proved an unqualified success. In the old method the pulp was agitated in separate vats which had no communication with each other, each constituting a self-contained unit. By the continuous system the 'Pachucas' are arranged in series or in batteries, and the pulp overflows from one into the next and passes through the whole series before its discharge to the filters. The method of communication used is a pipe set at an angle of 60°. The upper end of the pipe is placed in the discharging tank, half way between the central airlift and the side of the tank, while the lower end is placed in the same relative position in the receiving tank. The upper end of the pipe is distant about one-third of the height of the tank from the top, while the lower end is one-third from the bottom. A. Grothe states that both M. H. Kuryla and J. E. Mennell report increased extraction as a result of using this method, but this would seem probably to be due more to the fact that the old system of agitation was not carried to the point of maximum dissolution, than to any other reason. There is no reason to doubt, however, that there is a considerable saving of cyanide where the continuous process is used. Other advantages are, that the tank is used continuously for agitation, and no time is lost in filling and discharging. Also, the discharge being from the side, and not from the bottom, there is an economy of gravity pressure, which in most plants is important. Furthermore, the discharge being continuous, the pressure is constant; which is essential in many cases where the pulp is filtered in pressure-filters.

The use of the silica-sponge diaphragm has caused a good deal of discussion during the year, but so far has not proved of great value. The idea, as well as the application, is so new that further service may suggest changes that will bring it into more extended use. The reported disadvantage is that the volume of air which can be passed through the sponge is too small to prevent classification in the pulp, and that the interstitial spaces become choked easily and are hard to clean. Other operators report very successful results. C. A. Fullon says that in the San Matias mill at Guanajuato the process has been very successful and has reduced the time of agitation from 32 to 12 hours. It would seem that for successful use, the pulp agitated should be ground very fine and contain a very high percentage of floculent. The Claney process was announced late in the fall, but up to the present it has not been tried in enough places to give sure basis for judgment as to its practical success. At one well known property the experiments were brought to rather an abrupt termination at the instance of the management, as experimental work lasting over a considerable length of time proved that, so far as this particular property was concerned, there was little hope of its being used to advantage. Further application of the process will be watched closely, as the problem of treating ores containing combined gold is one of much interest. The wonderful increase in the use of the Dorr thickeners and classifiers shows that they have come to stay, for a time at any rate, in slime plants. Some new things are promised soon from South Africa along these lines in addition to the Caldecott diaphragm-cone, but a discussion of these will come better from the pen of some South African.

The various forms of filters, both vacuum and pressure, are still merrily warring for the favor of the profession. Among the former the Butters and the Oliver are going into many of the mills that are being designed by engineers favoring vacuum-filters. The Butters company is providing a filter of 1000-ton capacity for the Dos Estrellas which will handle the slime from the No. 1 and No. 2 plants, and it is understood that the Real del Monte is to use the Butters in its enlarged mill. Another new Butters installation is at the Palmilla, at Parral, while the La Blanca and others have put in Moore filters.

Among the pressure-filters the Merrill seems to be gaining great headway. The Santa Gertrudis engineers decided on this type for their new 600-ton mill after competitive tests (held at the mine on

ore of the usual character), and in which a number of manufacturers of different types competed. The Merrill filters, it is also given out, are doing good work at Esperanza, where the management has recently given an order for one more, making six in all. The New York Honduras & Rosario Co. is also installing two of the large 90-leaf type in Honduras. At first when the Merrill press was used it was found that a certain amount of granular material was necessary in the slime. By a very ingenious idea, known as 'centre washing', this objection has been largely overcome. The 'centre washing' system consists simply of filling the press to a point where there is left an opening through the centre of the cake about ¼ in. wide. Solution or wash-water is introduced into this opening through the nozzles on the automatic sluicing-bar or through the sludge-feed channel, and leaching begins. The flow of liquid commences at the centre and proceeds outward in both directions. The result is that instead of a solid 4-in. cake (which if very talcose, was formerly impermeable), there is now in the same leaf two cakes, each 1⅞ in. thick, which are readily permeable, even when formed of the most talcose slime.

Among other filters, the Kelly seems to be achieving an increasing measure of popular favor. The great value of the Kelly lies in the small amount of water used in its operation, which is no small factor in many places where the water supply is limited and evaporation heavy. At the new mill of the Veta Colorada, at Parral, 8 Kelly presses working in 2 batteries of 4 each, are being installed, and 2 are in use in the Carmen mill in Guanajuato. The Tigre mill in Sonora is also to be equipped with Kelly filters. This last mill is rather remarkable among Mexican plants from the fact that its stamps are to weigh 1250 lb. It would rather seem that there is a tendency toward heavier stamps in Mexico as well as elsewhere. Certainly the trend is all that way farther north, although as yet designers in the United States have not dared to go as far in the matter as have engineers in South Africa, where some of the latest plants include stamps of 2000 lb. weight. A number of mills are being designed for work on gold ores containing stamps weighing 1250 lb., and the probabilities are that, if these show good economic results, the fashionable stamp-mills of next year will include still heavier heads. Tube-milling is also gaining in favor steadily, as it has been shown that fine grinding results almost invariably in increased amalgamation as well as added extraction in the subsequent cyanidation. The distinctive feature, however, of the fine grinding of gold ore seems to be in a release of the gold in the sulphides, thereby shortening the necessary time of contact with cyanide solution. This makes possible in many cases the direct cyanidation of the sulphides in the same flow with the slime and thereby does away with losses due to concentration.

At Cripple Creek the subject of the economical handling of the low-grade sulpho-telluride ores remains still the important one. The metallurgists of this district have worked untiringly on this problem, and this year brings high hopes that the solution is near at hand. At the Stratton's Independence a second mill-unit has been started by Philip Argall. The process used here was described by P. H. Argall last year.* In the middle of the summer the new mill of the Portland G. M. Co. was started. The company has been loath to give out information as to results until success had been demonstrated beyond doubt, hence the incompleteness of published descriptions of the new mill. In a general way, it is understood that low-grade sulpho-telluride ore assaying $4 to $5 per ton is slimed by standard methods and agitated for about six hours with cyanide solution in Pachuca vats. This is followed by another agitation with bromocyanide and the pulp filtered and washed. It is said the extraction is about 80%, and the cost reasonably low, considering the complex nature of the ore.

In Nevada the year shows the Montgomery-Shoshone mill shut down, probably for good, but on the other hand it now seems certain that in the spring work on two new mills will begin. The Belmont will have its own plant, situated at Tonopah, and in all probability this mill will be modeled along the same lines as the Montana-Tonopah, which continues to give good satisfaction, and in which there has been a steady improvement in methods from the first. The Nevada Hills will, in all

**Mining and Scientific Press*, January 1, 1910.

probability, erect a mill in the spring, although the tonnage to be treated still seems to be in doubt. It is rumored that the plant will contain 60 stamps and have a capacity of 500 tons per day. Being

controlled by the same interests as the Goldfield Consolidated, it is not surprising that the provisional flow-sheet shows similarities to that of the great Goldfield mill. No article of last year's cyanide work is complete without some mention of the fire at the latter and the remarkable rapidity with which operations were resumed. It speaks volumes for the pluck and energy of the men responsible that, within a few weeks after such a disastrous fire, the mill was running as smoothly as ever. The Goldfield Con. engineers deserve the thanks of the profession for the information contained in a very attractive booklet which was sent to a large number of professional men. The information contained will be of great value, owing to the graphic representation of the actual operating factors in a large and modern plant. J. R. Finlay and J. W. Hutchinson are to be congratulated on having taken a step which it is hoped others will follow. Reproductions of three of these charts, covering filter-discharging, crushing-conveying, and tube-milling costs, accompany this article. In examining them it should be remembered that during April, May, June, and July only 70 stamps were dropping. Not only are the costs high for these months, but the averages for the year were necessarily raised by this circumstance. At the Pittsburg Silver Peak mill, 20 additional stamps have been put into service during the year, bringing the total up to 120. About 15,000 tons of ore per month is being crushed. Considering the fact that this company is operating in Nevada and under typical Nevada conditions of high cost for labor, power, water, and supplies, the working costs are little short of marvelous. The latest figures given out are $2.54 per ton, which includes not only the cost of the Pittsburg office, but takes care of all payments made for improvements and additions.

In California the new mills of note during the past year are those of the Trinity Gold Mining Co., in Trinity county, and the recently started cyanide plant of the Empire mine at Grass Valley. The Trinity mill is complete and modern, and should do good work. The process consists of crushing (40 stamps), amalgamation, separation of the pulp into sand and slime by Dorr classifiers, leaching of sand in vats, agitation of slime in 'Pachucas,' followed by Dorr thickeners, Oliver filters, and Merrill precipitation presses. The cyanide annex that has just been added to the Empire's crushing and amalgamation plant contains Oliver

filters for the slime and Merrill precipitation presses. This plant displaced the old-fashioned concentrating and canvas plant which has for many years done such good work. At the Homestake in South Dakota, there have been no changes of note during the past year. The slime-plant, with its 30 Merrill presses, has now reached a point where a 90c. product is being treated at a cost of 20c. per ton.

In British Columbia a large mill will be erected in the spring near Republic, where mining is becoming more active. The metallurgy of the Republic ores is extremely difficult, and, as the ore is of low grade, large tonnages must be handled in order to make a profit. Although the new mill is not yet under way, it is understood that it will consist of 100 heavy stamps followed by fine-grinding, probably in tube-mills. Agitation in Pachuca vats will be followed by Butters filters and zinc-dust precipitation. Engineers of the Mother Lode company are at present busy with the designs for a plant to be erected near Salmo, and work on the first unit will be started in the spring. In Ontario, spring saw the commencement of operations in the Nova Scotia mill at Cobalt, which was the handiwork of A. G. Kirby, of Reno, Nevada. The results obtained are said to be excellent, and this being the case, it would seem as if the main features of the milling of Cobalt ores were settled. Of one thing there can be no doubt, and that is, that Cobalt in time will come to be a district of many mills. The probability is that the high-grade ore will always be shipped, but operators will find not only the low grade, but probably the middle-grade ores to be well adapted to treatment in well designed mills. A short distance from Cobalt is the newly discovered camp of Porcupine, concerning which there is only one feeling on the part of the men who own ground there, and that is one of supreme confidence. This is being expressed by putting up mills. Two are now certain, with rumors of several more. On the Timmins property, a big mill will be built, but work has not yet begun. On the Dome property the design of the plant has been completed, the machinery ordered, and the coming spring will see a large force of men at work. The Dome mill will consist of 40 stamps of 1250 lb. weight, followed by amalgamation, Dorr classifiers and thickeners, tube-milling, agitation in Pachuca vats, Merrill slime-filters, and Merrill zinc-dust precipitation.

Some work is being done in Alaska, but the only feature to be commented on there is the announcement of operations in the cyanide plant of the Alaska Treadwell, where a mill has been built for crushing and cyaniding the concentrate that in the past has been shipped and smelted. At the termination of the present smelting contract, February 4, this mill is to be put in regular operation. The most striking peculiarity is that 80% of the gold in the concentrate will be saved on plates following tube-milling and prior to cyanidation. The new mill will effect a great saving for the company, and R. A. Kinzie and his associates deserve great credit for their work.

Summing up now briefly the features of the year's work in North America, the following stand out prominently: (1) The increased use of Pachuca vats and the application of the process of continuous agitation in them. (2) The tendency to demand heavier crushing duty of the various crushing machines, particularly of stamps. (3) The continued demand for fine crushing with attendant changes in classification and filtering practice. (4) The increasing growth of the practice of cyaniding the sulphides and vein-material in the same operation.

COPPER SURPLUS

Below are presented figures, in pounds, of the United States surplus, visible foreign supply, and world's surplus of copper, the figures being based on returns of the Copper Producers' Association.

1909.	U. S. Surplus.	Foreign Visible Supply.	World's Surplus.
January	122,357,266	124,716,480	247,073,746
July	154,858,061	150,928,960	305,787,021
1910.

SIERRA MOJADA ORES

The ores of silver, lead, and copper at the Vita Rica mine, Sierra Mojada, Coahuila, Mexico, according to a paper read before the Geological Society of America by Frank R. Van Horn, occur on the contact or a short distance below the contact of an acid breccia with an underlying limestone of Cretaceous age. There are some indications of a fault plane between the two rocks, such as clay selvage and slickensides. There are two types of ore, one silver-lead and the other silver-copper. In the former, the minerals are all oxidized and consist chiefly of argentiferous cerussite with native sulphur and some gypsum. The bulk of the ore from this mine, however, seems to belong to the silver-copper group and contains sulphides as well as oxidized minerals. Minerals noticed here were chalcopyrite, chalcocite, covellite, along with native copper, malachite, azurite, cuprite, and gypsum. Another zone consisted of a silicious limestone containing up to 10% of barite which was impregnated with cerargyrite and native silver. Here the copper content was smaller and rarely exceeded 2%. Some three years ago, a fault was discovered in the northern part of the 'silver-lime' orebody. Along this fault-plane, silver and copper minerals of great richness have been found mixed with more or less barite. Some of the minerals noticed were native silver, argentite, proustite, and pearceite which has been found in but two or three localities in the world. A mixture of erythrite and barite was also noticed.

The Far East

By Thomas T. Read

Any review of mining conditions in the Far East for the past year must necessarily be semi-political in its character, so inextricably are the threads of international politics interwoven with those of economic development. Perhaps the most significant political event of 1910 is the formal annexation of Korea by Japan, completing the gradual spread of Japanese sovereignty since the Russo-Japanese war. Whatever the effect of the change on the Korean people, it is unquestionable that the mining industry can only be benefited by it. The regulations that the Japanese régime has imposed are eminently fair and reasonable, and place foreign capital at no disadvantage. And even if such were the case, it would still be an advantage to have a definite and aboveboard set of conditions to encounter, rather than to be obliged to thread the mazes of the court of the Korean Emperor. No less important is the secondary result that under Japanese control railroad-building will go forward as fast as is warranted by the development of industrial resources. Gold mines bear the handicap of distance from railroad and water transportation with comparative ease, but the other metals find it a heavy incubus, and the copper mines of northern Korea can scarcely be expected to flourish while under this disadvantage. The Chicksan mines, south of Seoul, have shown remarkable development recently, and, in addition to the large area of dredging ground proved last year, have opened up their main vein in numerous places for about five miles along the strike, finding excellent milling ore all along. The present 10-stamp mill is making a good profit and the second similar plant, which has just been completed, 3 miles farther north, has already more ore than it can handle from the development work in the neighboring openings on the vein. This mine promises to equal in importance the Oriental Consolidated, and a more detailed description of it will appear in a later number. The concession is owned jointly by a Japanese and an American syndicate, but the American interest will probably acquire the complete control.

In Manchuria the Pen-hsi-hu colliery has entered the list of producers, and its coal is being placed on the market by the Fu-shun colliery agencies, both mines being controlled by the South Manchurian railway. The mine has been opened with joint Chinese and Japanese capital, each nationality furnishing one-half of the $1,000,000 subscribed. The Chinese Government is to receive 25% of the net profits. The mine is well equipped, though not so large as its predecessor, which has probably produced 800,000 tons of coal during the year. I have not seen the coal now being placed upon the market, but all earlier advices indicated that it is somewhat inferior in quality to Fu-shun coal. The mine is about fifty miles southeast of Mukden, on the line of the Mukden-Antung railway. The technical man might wonder at the opening up of a new mine with borrowed capital within fifty miles of another that has just been developed to produce 3000 tons per day, and in the face of a coal market where prices have been constantly on the decline, owing to the steady entrance of new producers into the field. The same observer may also have been puzzled by the exceedingly expensive construction of the Mukden-Antung railway, passing through country that as yet shows no signs of profitable exploitation and joining two points that do not appear to have any economic need of connection, since Mukden is already well served by the excellent port at Dalny and is connected with Tientsin, Newchwang, and Vladivostok as well. It requires no great intelligence to detect the political significance of such operations. It may be taken for granted that Japan has no intention of ever restoring sovereignty of southern Manchuria to China unless compelled to do so. Recent developments further such designs in more than one way: Firstly, by increasing the amount of money invested in Manchuria, China, obliged to buy at a high figure all such improvements, as she sooner or later must do if she is to regain her sovereignty, may find herself seriously embarrassed to find the necessary capital. Secondly, in the event of another war with Russia (and prophecies of such a war are not lacking), Japan, instead of striking her first blow at Dalny, could strike it at Harbin, the point where she left off when hostilities ceased. Last, but not least, every fresh move of this sort increases the friction with the Chinese authorities and increases the possibility of bringing about a war reputed to be desired by Japan—a few months to capture Peking and a demand for Manchuria as a war indemnity would be such a simple Japanese solution of the difficulty! But so far China has allowed her nose to be pulled and her face to be slapped by Japan with patience and dignity, knowing that to assume a belligerent attitude would be fatal. Unless some other great Power comes to China's aid, her control over southern Manchuria will never be regained, and of course the northern part could no longer be held when the intervening territory was lost. Russian settlers are working coal mines south of the Amur river, and bid defiance to the Chinese authorities who have attempted to stop them. The Manchurian situation is absolutely critical from a political point of view, but even so important a political matter can scarcely be afforded more space in a mining journal.

The matter of the re-purchase of the collieries owned by the Chinese Engineering & Mining Co. still drags; it is apparently the definite intention to make the purchase, and it now remains for the Chinese Government to manage to obtain it at anything like a reasonable price. The mines have been worked to a great depth and only have about eight years' supply of coal in reserve, but it will only be natural for the company to try to sell on the basis of the present earnings. It will be a little too much, however, considering how the concession was originally obtained, if the Chinese Government is obliged to pay an exorbitant price for it now.

With the completion of the Tientsin-Pukow railway, which should soon be in operation throughout

its entire length, the coal mines near Yi-hsien, in southern Shan-tung, will enjoy the benefit of railroad connection with the two ports of Tientsin and Shanghai. But the chief effect of the mines, which possess a plentiful supply of good coal, must remain local, as the numerous coalfields of China are so extensively opened now that the entrance of a new mine into the market does not count for so much as it did a few years ago. The situation is entirely controlled by transportation facilities and will doubtless remain so indefinitely. More remote coalfields begin to produce as the railroads extend themselves into the back country. The southern edge of Mongolia has, for example, become a noteworthy coal-producing area since the opening of the Peking-Kalgan road throughout its length. The railroad itself owns one valuable mine, and many others throughout the district are in progress of change from ancient to modern methods.

The Han-Yeh-Ping Coal & Iron Co. has shown a considerable growth during the year, having started its new 250-ton per day blast-furnace and correspondingly increased its production of ore and coke. In addition to supplying rails, fish-plates, and track-bolts for the railroads now under construction in China, the company has been able to sell some pig iron both on the east and west coasts of the United States, in spite of the duty on pig iron. As the demand for rails in China becomes steadier, the company will gradually be released from the necessity of marketing any pig iron abroad, and can extend its steel plant. The demand for structural steel in China is still comparatively small.

One hears rumors from time to time of the starting of iron works at some point near the border of Honan and Shansi, but the project does not seem to have taken any definite shape as yet, and, indeed, it would be most inadvisable for it to do so, before exploration discloses the existence of a body of ore sufficient to support such a plant, the more especially as all the exploration already done indicates that no such supply exists. The neighborhood of Nanking offers a much more suitable site for the erection of a blast-furnace plant, but until the demand in China for steel products becomes great enough and steady enough to exceed the capacity of the Han-Yeh-Ping works, there seems little reason for starting a new enterprise. A small plant for the manufacture of wrought iron and crucible steel might be made the basis for the profitable production of cutlery and the like, and would present much greater possibility of success.

It not infrequently happens that the regions richest in mineral resources are the least accessible. China is no exception to this, for all that portion of her southwestern area which is most rich in minerals could until recently only be reached by many weeks of difficult travel, and shares with the neighboring Thibetan plateau the distinction of being one of the least known areas of the modern world. But this condition will change speedily, for the railroad constructed by the French has already reached Mêngtze and is being rapidly pushed northward to Yunnanfu, while an extension to Chaotong (near the Yangtze river) has already been surveyed. Construction work is also under way on the road from Hankow to Chen-tu-fu, so that two routes into the rich Ssu-chuan country will soon be open. It is not at all improbable that the mineral wealth of Ssu-chuan has been overestimated by travelers, few of whom were technically trained observers, and that Kuei-chou will prove in time to be the portion of the Chinese Empire richest in mineral wealth. At present it produces only antimony, zinc, lead, and mercury, the antimony being most important. Yunnan, with its copper and tin, is the leading province at present and is likely to retain its supremacy for some time. Approximately $1,200,000 has been subscribed by Chinese to re-open the old tin mines at Koju and equip them with modern machinery, so it is not improbable that the amount of tin produced in Yunnan will largely increase in the next few years.

Kuangtung and Kuangsi are being actively explored by a Chinese company, M. T. Yung being in charge of operations. They have opened up a promising lead mine, but have not yet begun extensive operations. C. Y. Wang has been appointed chief of the Mining Bureau for Kuangsi, and development work in these two provinces should now go forward rapidly.

No commentary on conditions in Southern China would be complete without reference to the foreign loan for the construction of railroads in the south and southwest. It will be remembered that the loan was about to be concluded with the English, French, and German governments when the United States demanded the right to participate. This was conceded, whereupon three obstacles appeared: an English company produced a half-forgotten concession, the rights of which, so it claimed, were being infringed; the English government ceased to exhibit any apparent desire to conclude the loan; and last, but most important, the native people seem to be really in earnest in their protest against the loan, and as the Government in China seldom attempts directly to controvert the popular will, it seems not at all likely that the loan will be carried to completion, in its original form at any rate.

The company that was formed to exploit petroleum in Shansi seems to be meeting with a moderate degree of success, but the district is so far from the ordinary lines of trade that accurate information regarding it is hard to obtain. The other company organized with foreign capital to exploit petroleum in Saghalien seems to have fulfilled its main purpose of selling stock, and the shares have considerably declined in value, while definite evidence of the actual existence of profitable quantities of petroleum is still lacking.

Gold mining in China is interesting, but for most portions of the Empire no stronger word would be justifiable. In almost all parts of the country some gold occurs and is worked in a desultory fashion in many of them. But only along the Amur river are workings extensive enough and the production sufficient to attract more than passing attention. A single exception should be made, namely, the cen-

tral portion of Shantung. Many promising districts are known there, and one mine has been developed until its value has been definitely proved. Some years ago a stamp-mill and a chlorination plant were operated, but extraction was unsatisfactory and the mines were shut down. Many attempts have since been made by foreign companies to obtain possession of the concession, but all have proved unavailing, and the dog-in-the-manger attitude was consistently maintained. Not long since, a request was made to have the mine included in the Wei-hai-wei zone, but such a suggestion could scarcely be acted on, for the Chinese authorities have jealously guarded against the Germans obtaining any greater foothold in Shantung than they already possess, and any concession made to British interests would immediately be followed by German demands. Recently the governor-general of Shantung has petitioned Peking to allow the mines to be worked, whether with foreign or Chinese capital is not stated. The difficulty of developing metal mines in China with native capital is twofold: there is a scarcity of capital for all the numerous phases of industrial development, and, further, the Chinese object to risking their money in the metal-mining industry since there have been few examples of successful operations. Coal mines have been so profitable that funds are available for opening new ones, and it is even likely that they may be opened up faster than the growth of consumption warrants. But metal mines are in something of a deadlock, foreign capital not being permitted and Chinese capital being unavailable until some profitable mines have demonstrated the soundness of the industry. The situation is not unlike that of the Irishman who remarked of his tight boots that he could get them on after he had worn them a few days.

No progress has been made in the organizing of a competent Mining Bureau for the Empire. Good men have been appointed in several provinces, notably K. Y. Kwong in Chili, C. S. Lowe in Ssu-chuan, and C. Y. Wang in Kuangsi, but a single man can do little when there is no organization or co-operation, and as long as the Boards in Peking remain under the control of men without proper training, the present inchoate condition will persist. It is most unfortunate that such waste of effort in obtaining accurate and trustworthy information regarding the mineral resources of the Chinese Empire should be allowed to continue.

MINERAL PRODUCTION OF GREAT BRITAIN AND IRELAND

The report by R. A. S. Redmayne, chief inspector of mines, on the output of metals and minerals in the United Kingdom during 1909 was published in November. The most important mineral produced is coal, of which the output was 263,774,312 tons, valued at £106,274,900. Of this amount, 4,258,980 tons was anthracite; this was mined chiefly in the district to the north of Swansea, but some also came from Scotland and Ireland. The figures compare with 261,528,795 tons and £116,598,848 during 1908. The amount exported was 65,694,267 tons. How large a proportion of the mineral wealth of the country is supplied by coal may be judged by the fact that the total value of all the minerals produced was £119,394,486. The output of iron ore was 14,979,979 tons, valued at £3,869,777; figures not much different from those of 1908. The iron ore imported during the year amounted to 6,328,623 tons, valued at £4,986,360, of which 75% came from Spain. In addition to this, 593,301 tons of purple ore was used, that is, the iron oxide residue from burnt pyrite. The total production of pig iron during the year was 9,531,987 tons, as compared with 9,056,851 tons the year before. The output of lead showed a slight increase, the figures being 29,744 tons of concentrate containing 22,463 tons of metal, as compared with 29,249 tons and 20,999 tons the year before. The production of silver from this ore was 142,006 oz. during 1909 and 135,154 oz. in 1908. The most productive mines are the Mill Close in Derbyshire, the Boltsburn in Durham, the Rhosesmor and Bryn-Celyn in Flint, the Queensberry and Leadhills in South Scotland, and the Foxdale in the Isle of Man. The import of ore during the year was 15,542 tons, and of pig and sheet lead 207,660 tons. The output of zinc ore in the United Kingdom continues to shrink. The figures were 9902 tons of concentrate as compared with 15,225 tons during 1908 and 20,082 tons during 1907. The Cumberland and Flint mines are producing much less than formerly, and the largest output was 1876 tons from the Great Laxey in the Isle of Man. The amount of zinc ore and concentrate imported was 73,814 tons as compared with 60,687 tons the year before, the chief countries sending it being Italy, North Africa, and Australia. In addition 121,552 tons of zinc was imported during the year, chiefly from Belgium and Germany. A small amount of zinc, 5314 tons, was imported from the United States, as was also 2622 tons of zinc ore. The amount of ore imported from Mexico was 596 tons. The only place where electrolytic zinc is produced in the British Isles is at Northwich, where Brunner, Mond & Co. extract a remarkably pure zinc by the Hoepfner process. The output of tin concentrate continues to increase slightly, and stands at 8289 tons as compared with 8008 tons in 1908 and 7080 tons in 1907. The figures are higher than any since 1895. The value of the output was £617,376. The largest producer was Dolcoath, with 1904 tons; then came Carn Brea & Tincroft with 1106 tons, Basset with 844 tons, South Crofty with 682 tons, Grenville with 633 tons, East Pool with 586 tons, Levant with 422 tons, Wheal Kitty with 241 tons, and West Kitty with 230 tons. The amount of tin ore and concentrate imported was 24,086 tons, of which 14,886 tons came from Bolivia. In addition, 41,725 tons of metallic tin was imported, 36,084 tons of which came from the Straits. Of other metallic minerals the production was: Wolfram 376 tons, manganese ore 2768 tons, copper ore 3531 tons, bauxite 9500 tons, and uranium ore 6 tons. The output of white arsenic during the year was 2880 tons, worth £28,187, as compared with 1936 tons worth £19,190 during 1908. The largest producer was Wheal Friendship near Tavistock, with 711 tons,

The Petroleum Industry in California

By Ralph Arnold

General Statement.—The year 1910 was marked by such an increase in production of heavy or fuel oils as to cause a congestion and an overstocking of the market, and a resulting fall in price from 63 to 30 or 40c. per barrel at the well. This has been especially true in the San Joaquin Valley districts, which have practically no local markets. In addition to the general halt in development caused by the overproduction and drop in price, the withdrawal orders of the President and application by the officers of the Interior Department of the Yard decision to oil lands, added materially to the pessimism of the operators everywhere and a fall in the price of oil land and oil securities. The Government withdrawals and the Yard decision have also affected the status of titles to such an extent that it is practically impossible at present to secure outside capital to even continue development, on government land in the withdrawn areas. This has forced many small companies to the verge of bankruptcy and has resulted in the acquirement of the interests of many of these companies by the stronger corporations. It is the hope of the oil men that remedial legislation by Congress and a possible reversal of the Yard decision as applied to the oilfields, will be brought about in the near future, and to that end considerable activity has been displayed by the various oil men's associations.

The completion of the Producers Transportation Co.'s 8-in. pipe-line, which connects the San Joaquin Valley fields with the seaboard at Port Harford, has been the greatest element in bettering the market conditions. It is a coincidence that this line was completed at about the time the great Lakeview gusher came in. If this line had not been practically complete at that time it is almost certain that the congestion of oil would have been such as to have entirely ruined the market for months to come. The Associated Oil Co. also completed a new 8-in. line from the Westside fields of the San Joaquin valley to San Francisco Bay, and this has likewise helped to relieve the congestion. The most important development in the marketing end of the industry was the agreement entered into by the Independent Producers' Association and the Associated Oil Co., whereby the latter is to market a large part of the product of the former. The sale of a considerable quantity of oil to two of the northern transcontinental railroads for use as fuel has also opened a new and promising outlet.

Coalinga District.—The Coalinga district lies in the western part of Fresno county and embraces more than 32 sq. mi. of highly productive territory. The main part of the district is separated into the Eastside, Westside, and Oil City fields. South of them are the Jacalitos, Kreyenhagen, and Kettleman Hills prospective fields. The Eastside field yields oil of 18 to 30° Baumé gravity, the daily production of individual wells being from 10 to 1000 bbl. per day. The Westside field furnishes 12 to 19° Baumé oil, the wells showing about the same range in production as the Eastside. The wells of the Oil City field are small producers, but the oil is light, being from 32 to 38° Baumé in gravity. The most important developments in the Coalinga district during the year were the finding of 37° Baumé oil at 3700 ft. in the Bohemian well in Jacalitos creek, five miles southeast of Coalinga, proving this new territory, and the bringing in of the Coalinga Mohawk well

Coalinga Devil's Den Oilfields.

with 30° Baumé oil on section 12, T. 20 S., R. 15 E., on the Coalinga anticline, marking an important extension of the Eastside field. The Bohemian well and that of the Azores Oil Co., a short distance south of the Bohemian, have been testing the limited area on Jacalitos creek, outlined by the geologists of the United States Geological Survey as possible oil territory. The prediction of the Government geologists, as to the depth at which the oil measures would be found, was verified to within less than 100 ft. in the case of both of these wells. In the Kreyenhagan field the results have not been especially encouraging. The El Cerrito well at the southern end of the field, was drilled to over 4000 ft., with negative re-

sults, and has been abandoned. Two or three other wells are drilling nearer the outcrop of the oil-sands than the El Cerrito and are meeting with better indications, but so far none have proved unqualified successes. The Kettleman Hills are receiving their share of attention. Two entirely different possible sources of oil are being tested; the sands of the Tulare and Etchegoin formation being penetrated by wells along the eastern flank of the hills, and the Vaqueros formation being sought by wells started near the axis of the anticline, in the heart of the hills. Oil in commercial quantities has, as yet, not been found in any of the wells. Those on the flanks have not proved productive in the horizons penetrated, and those in the centre of the hills have not yet reached the Vaqueros. The limits of the proved productive territory have been extended eastward in the Westside field by the Valley, Empire, and Nevada (Sec. 20) wells, while the well of the Coalinga Monterey Oil Co. on section 4 will still further extend the limits if it prove a producer. The well of the Standard Oil Co. in the northwestern corner of section 28, T. 19, R. 15, has practically bridged the gap between the northern end of the Westside field and the Eastside field. The southeastern extension of the Eastside field, even beyond the limits established by the Mohawk, is practically assured by the well of the Southeastern Oil Co. on section 18, T. 20 S., R. 16 E., although the depth at which the productive oil-zone will be penetrated is not yet determined. It is certain, however, to be the deepest hole yet drilled in this region, and will probably not fall far short of 4800 ft. The Polvadero Oil Co. is testing the territory between the Eastside field and the Kettleman Hills, but probably at a point where the productive sands lie at a prohibitive depth below the surface. A large number of new wells have been drilled in the main part of the Eastside and Westside fields, but aside from those mentioned, none added new territory to the previously proved area. The Acorn well, a half mile northwest of the proved limits of the Westside field, has practically shown that no lower formation than that now yielding the oil in this field, can be counted upon for production in that vicinity. The hoped-for southern extension of the Westside field to section 18, T. 21 S., R. 15 E., has not yet materialized, although the Roychester well in the northeast corner of the section is said to have recently penetrated a promising sand.

Devil's Den and Lost Hills Districts.—Considerable desultory prospecting was done in the Devil's Den district during the year, but no positive results were obtained, although much evidence supporting the theory that small flows will eventually be found at favorable points was obtained by these prospect holes. The most important find in the region was that made in section 30, T. 26, R. 21, near the south end of the Lost Hills, in the well of the Lake Shore Oil Co., where commercial quantities of 18° gravity oil were found at a depth of about 500 ft. This caused an immediate rush to the Lost Hills, and at present there are a number of portable and one or two standard rigs drilling in the region. Rumors of discoveries in these wells are hard to verify, as the operators are averse to disclosing their finds while the question of land titles is so unsettled. It is evident, however, from the find in the Lake Shore well that the classification of the land as originally proposed by the geologists of the Geological Survey was not correct and that the lines of possible oil territory are considerably wider on the flanks of the Coalinga anticline in this part of the country than was previously believed. The oil in this well either comes from the underlying Eocene or Tejon formation, which furnishes the oil in the Coalinga district, and migrates upward through a fracture along the axis of the Coalinga anticline, or else it originates in shales of the Santa Margarita formation and collects in the overlying McKittrick beds, as it does in the McKittrick, Midway, and Sunset districts to the south.

McKittrick District.—Little development of importance took place in the McKittrick field. Practically the only extension of developed territory was that made by the discovery of oil in section 36, T. 29, R. 21. Near the middle of this section and also in the southwestern part of section 32, T. 29, R. 22, heavy oil was found in prospect wells. Several new wells were put down in the Temblor field, six miles northwest of McKittrick, but these added but little to the already known productive area.

Midway District.—The development of the Midway district during the year has been rapid, in spite of the retarding influence of the President's withdrawal order of September 27 and other activity tending to discourage exploitation of government land, on which the Midway district largely lies. In the Midway field proper, which includes the Midway valley and the foothills flanking it on the southwest, the most important discoveries were those of the Standard Oil Co. on section 30, T. 32, R. 24, the Regal Oil Co. (Union Oil Co.) on section 14, T. 32, R. 23, and the American Oilfields Co. on section 36, T. 31, R. 22. Wells ranging in initial production from 3000 to 12,000 bbl. of 20 to 24° Baumé oil were brought in by the first two companies, while the last-named had one well that is said to have produced at the rate of 30,000 bbl. or more per day, for a considerable period. One of the interesting points about this last well is that the 12-in. casing with which the well was started was carried directly into the oil sand without any water being found, and therefore the well was completed with a single string. Enough sand was produced by this well to completely submerge the floor of the derrick and was built up in a cone about the well to the height of the belt-house roof. The Standard Oil Co. and the Honolulu company both brought in large gas wells in the Buena Vista Hills. The Standard's well on section 26, T. 31, R. 23, has been flowing steadily for several months at an estimated rate of 40 million cubic feet per day. The pressure in this well is so great that several accidents have attended attempts to shut it in. About 2 million cubic feet per day are being utilized by the company as fuel in the development of its properties in the Midway field. About 38 million cubic feet goes to waste. The Honolulu company has been more successful

in controlling its wells and now has the big gas well on section 6, T. 2, R. 24, shut off. With these two big wells practically proving the possibilities of an enormous gas reserve in the Buena Vista Hills, it is not surprising that rumors are now rife to the effect that a pipe-line is to be built to transport the gas which underlies at least a great portion of the Buena Vista Hills, to the parious parts of the State.

In the north end of the Midway field the development has been quite rapid, but has apparently reached the limit in sections 12, 14, and 15, T. 31 S., R. 22 E. The Union Oil Co. has drilled a hole 4680 ft. deep in the middle of section 10, T. 31, R. 22. This well is said to have gone through about 200 ft. of heavy tar sand at a few hundred feet below the surface, but farther down nothing was found but brown shale. This indicates that the commercial quantities of oil in the Midway field are, so far

Lake View Well, November 18, 1910.
(Photo by W. C. Mendenhall.)

as has yet been proved, confined practically to the basal McKittrick beds and that below the base of the McKittrick formation, that is, in the Santa Margarita and Monterey formations, there is little possibility of obtaining a commercial yield.

A considerable amount of development work was carried forward during the year in the Elk Hills field, which lies to the northeast of the Midway and McKittrick fields, but no definite results were obtained by any of the wells. Within the last month, however, the Associated Oil Co., it is reported, has found a light oil at a depth of between 3100 and 3200 ft. in its well on section 26, T. 30, R. 23. Tar and oil sands have been found in several of the wells at a less depth than this, but it seems likely that the productive beds lie at 3000 ft. or deeper throughout the major portion of the Hills. Development in the Buena Vista valley, which lies between the Elk Hills and the Buena Vista Hills, has not been attended by marked success, although oil sands have been reported here in one of the wells at a depth of a little over 3000 feet.

Sunset District.—The separation of the Sunset from the Midway district is arbitrary, the line generally accepted being that which marks the change from the San Bernardino Base and Meridian on the south, to the Mount Diablo Base and Meridian on the north. The famous Lake View well No. 1 is about a quarter mile south of this division line, so that it is in the Sunset district. This well, which is in the southwest corner of section 25, T. 12 N., R. 24 W., came in March 15, 1910, and has, up to the end of 1910, produced in round numbers about 8,000,000 bbl. of oil of about 20° Baumé gravity. Its highest rate of production was during the first two months of its existence, when by actual weir measurement, it flowed one day 68,000 bbl. At the present time the well is producing about 10,000 bbl. per day, of which from 10 to 15% is water. This water is believed to come from above the oil sand and to have been admitted into the hole through the wearing out of the casing by the constant friction of the sand which accompanied the oil during the initial stages of its flow. The Lake View is probably the most phenomenal producer ever drilled on this continent, if not in the world. The sand from which it produces is in the same oil zone as that furnishing the production throughout the Sunset, Midway, and McKittrick districts, and is in the lower McKittrick formation of upper Miocene age. In addition to the Lake View well, other gushers have been brought in during the year on the same fold, the 'thirty-five' anticline. Among them are the Consolidated Midway, American Oilfields, Monarch, Thirty-six, and several others. The proving of the eastern extension of the Thirty-five anticline by development has, perhaps, been the most important event in the Sunset field during the year. The finding of commercial quantities of oil in the Essex, Bronco, and other wells on the flat east of Sunset, had added considerable acreage to the proved ground of the main Sunset field. Along the foothills east of Sunset, the work of the Western Minerals Co. has proved the presence of commercial quantities of a greenish oil of about 18° Baumé gravity, which has been found to carry a high percentage of lubricants. No large wells have, so far, been developed in this new field, and the conditions do not favor the phenomenal yields of the north end of the district. Little work has been done in the old Sunset field, the companies operating there having contented themselves with the effort to keep the old wells open and producing. An attempt to extend the old field, especially northeast, has not met with success. The Anaconda well in the eastern part of the old field has been drilled down through the present producing zone into the Santa Margarita shale, but so far without commercial quantities of oil being found. A similar attempt with similar results, has been made on section 36, T. 12 N., R. 24 W.

Kern River District.—Development in the Kern River district was confined almost entirely to the outskirts of the previously proved area. The work of the Kern River Oilfields of California, Ltd., in section 19, T. 28 S., R. 28 E., on the north, the Overland Oil Co. on the east, and the Kern River Drillers, Metropolis, and Enos oil companies on the west and southwest extended the field slightly, but in most instances the small yields and heavy quality of the oil produced indicate that the limits of commercial productivity have practically been outlined.

(*To be continued.*)

Illinois Oilfields in 1910

By Raymond S. Blatchley

Illinois recovered from the general decline in production of oil in 1909, and in 1910 produced approximately 35,000,000 bbl., as against 33,685,106 in 1908, and 30,898,339 in 1909. General market conditions and the ability of the pipe-lines to cope with the supply enabled the State to continue its growth and place as third in rank. The returns for the first eleven months of the year only are available at this time. If it be estimated that the December output of the Ohio Oil Co. was equal to that of November: the general tank-car shipments were about 2,000,000 bbl.: and the oil runs outside of the Ohio pipe-lines, averaging 12,000 bbl. daily the first nine and 16,000 bbl. daily the remaining three months, were 4,680,000 bbl.: the total may be taken at over 35,000,000 bbl. The following table gives the pipe-line runs and stocks on hand (at the month-end) of the Ohio Oil Co. and also the Eastern pipe-line stocks, by months, in barrels:

	Runs, Ohio Oil Co.	Stocks, Ohio Oil Co.	Stocks, Eastern lines.
January	2,226,108	28,455,129	3,340,116
February	1,980,408	28,385,375	3,138,018
March	2,382,806	28,373,855	3,637,610
April	2,314,789	28,716,938	3,210,907
May	2,389,994	29,125,029	3,148,509
*June	2,399,606	29,213,290	3,724,919
July	2,638,253	29,271,719	4,187,362
August	2,572,859	29,289,164	4,141,713
†September ...	2,447,106	28,965,962	4,066,122
October	2,373,325	28,615,289	3,455,197
November ...	2,245,676	28,082,606	2,996,607

*Includes oil in iron tankage purchased.

†The Tidewater Pipe Line Co. ran 164,362 bbl. in September which was included in the Eastern pipe-line stocks.

The total runs of the Ohio Oil Co. in 1909 were 27,340,775 bbl. This company averaged 87,357 bbl. daily in 1908, and 74,903 in 1909. The total daily production of the State was 92,036 bbl. in 1908 and 79,810 in 1909. The tank-car shipments are those of the Sun Oil Co., Cornplanter Refining Co., Indian Refining Co., Missouri-Illinois Oil Co., W. F. Watson, Central Refining Co., and railroad shipments from Sparta, Ill. The pipe-line runs outside of the Ohio Oil Co. were made principally by the Tidewater Pipe Line Co., and the Indian Refining Co. The runs of the first half of the year were affected by the 1909 decline, but with the coming of summer, activity increased and the runs corresponded favorably with those of 1908 and the first part of 1909. The introduction of new pipe-lines into the fields increased the runs for the year. The prices of the two grades of oil remained stationary during the year. Oil of gravity over 30°B. brought 60c. per barrel, and under 30°B. 52c. per barrel.

Clark County.—The oil in and about Clark county was found at a depth of 400 to 600 ft. The area was drilled and exhausted so rapidly that there has been scarcely any work done in the field in 1910. Only the outer edges of the old Casey territory were tested more thoroughly, but without any notable results. One or two deep tests have been made in search of oil and gas in the lower rocks, resulting in one successful well. The Ohio Oil Co. drilled a well 2969 ft. deep on the K. and N. E. Young farm near Casey. A productive sand was found at 2750 ft. that yielded about 35 bbl. of oil. The oil seemingly comes from the Trenton limestone. The shallow territory of Clark, Cumberland, and Edgar counties scarcely produced 9000 bbl. daily during the year.

Crawford County.—The Crawford County pool is the largest in extent in Illinois and produces oil from various lenses of sand between 750 and 900 ft. deep. Over 5000 wells have been drilled in the area. In recent months drilling has been scattered over the entire Robinson pool. Some concentration of development took place near New Hebron and Flat Rock in the earlier part of the year. Early in the fall the drilling shifted to the Bellair, Licking township territory, in the northwestern part of the pool, where sands at depths of about 1000 ft. yielded a good production and enlivened the field once again. Crawford county produced as high as 100,000 bbl. daily in 1907 but in 1910 seldom reached 30,000 bbl. The new wells drilled during 1910 were small compared to earlier wells, indicating a sure drain that will cause the eventual abandonment of the field, unless lower sands yield oil.

Lawrence County.—A review of operations in 1910 shows that the active work continued to shift southward from Clark and Crawford to Lawrence county, where seven distinct sands produce oil in varying quantity and grade. They are found from 750 to 1900 ft., and in their order are: the Bridgeport sands No. 1 and No. 2, 750 to 900 ft.; the Buchanan sand, 1275 to 1400 ft.; the Kirkwood sand, 1550 to 1650 ft.; the Tracy sand, 1700 to 1750 ft.; the McClosky sand, 1825 to 1850 ft.; and the Green, Henry, and Pepple sands, each with but a few wells and of varying qualities of oil. The latter sands lie between 1850 and 1910 ft. The McClosky sand is found in the southern part of the county and is the richest developed in Illinois. The initial yield from wells in this sand is from 700 to 3000 bbl. The pool is narrow and small in extent, but seems to be longlived. The next best sand is the Tracy of the King-Applegate pool in the northern part of the county. The Kirkwood, Buchanan, Bridgeport, and Green sands follow in order. While the deep sands are rich, they are not as profitable as the old Siggins sands of shallow depth, because of the larger expense in drilling and the time required to complete the wells. The chief activities of Lawrence county in 1910 were in the McClosky and King-Applegate pools. Early in the year a new pool was opened on the outskirts of Lawrenceville. Only two wells, producing about 100 bbl. initially, were found in the pool, however, while several dry holes discredited the territory. The Lawrence County area is the source of many gushers from the deep sands, the average well yielding slightly over 107 bbl. initially. The average daily yield for the county during 1910 has been between 45,000 and 55,000 bbl. The oil comes from about 12,500 wells throughout the fields, all of which are connected

to the pipe-lines of the Ohio Oil Co. There never has been an oilfield of such extent opened up and the supply so well taken care of in so short a time.

Marion County.—The best recent results from wild-catting in Illinois were in Marion county. Three oil areas have been tapped, the first being the shallow sand midway between Sandoval and Centralia (now inactive); the Sandoval pool, the largest and most productive, and the Centralia pool. The oil from the two pools last mentioned comes from the Chester formations of the Mississippian series of rocks and is equivalent to the rich Kirkwood sand of the main fields. The most productive lens is known as the Benoist sand and is found between 1525 and 1600 ft. The greatest activity of the year has taken place in the Sandoval pool, just north of the town of Sandoval. Upon December 1 there were 35 producing wells yielding over 3000 bbl. daily, 16 dry holes, and 22 wells drilling. The outlet of oil from the field has been by railroad. Recently the Ohio Oil Co. completed a pipe-line from Sandoval to Vandalia, connecting with the Alton pipe-line, and is preparing to take most of the supply. The Centralia pool has four light producing wells, several scattered dry holes, and five wells drilling. A recent investigation of this territory was made by the State Geological Survey. It was found that the field lies along an irregular terrace upon the broad and gentle western flank of the Eastern Interior coal basin. The terrace is interrupted by structural domes. The general trend is north and south, extending to Duquoin, about 40 miles south of Sandoval, and to Brownstown and Pana on the north.

Bond County.—A new gas area was opened up early in the year near Greenville. The gas sand, known as the Lindley sand, was found from 950 to 1000 ft. deep, and yielded from 1,500,000 to 2,000,000 cu. ft. of gas per day from each well. The sand was easily correlated with the Benoist sand of Sandoval and the Kirkwood sand of Lawrence county. A recent test on the Brown farm, near Pocahontas, was carried to 1975 ft., where oil was found yielding an initial production of about 25 bbl. The pay came presumably from the Niagara limestone. Several other test wells have been put down in Bond county in an effort to outline more fully the present narrow limits of the gas area and the deep oil pay-sand. Much drilling is being done at the present time.

Wild-Cat Work.—There was a continued increase in wild-cat work during the year, particularly along the western side of the State. Drilling was in progress recently in Washington, Jefferson, and Perry counties in search of the irregular Sandoval-Duquoin terrace. So far the work has been unsuccessful. A shallow gas area was opened up near Jacksonville, Morgan county, in the late spring that developed six wells of small pressure. The gas was odorless and colorless, and burned with hot blue flame. It came from a depth of about 300 ft., near the top of the St. Louis limestone. Several wells have been drilled near Olney and Sumner, immediately west of the main Illinois fields. They were in the area lying near the axis of the Illinois basin. Other drilling was done in Gallatin county that was unsuccessful except for slight showing of oil in one or two wells. Other barren wells have been drilled near Iuka, Mt. Carmel, Carlyle, Waterloo, Vandalia, Walnut Hills, and Champaign.

The development in Illinois during 1910 is presented in tables below, compiled from the *Oil City Derrick*:

WELLS DRILLED IN ILLINOIS DURING 1910

Month.	Wells Completed.	New Production, Bbl.	Dry Holes.	Average Initial Production Per Well, Bbl.	Abandoned Wells.
January	111	5,331	17	56 2/3	0
February	158	6,840	43	58 2/3	5
March	128	5,593	29	56 4/9	3
April	157	7,260	41	62 1/2	10
May	192	8,091	43	54 1/3	6
June	211	9,267	50	57 9/16	14
July	172	6,386	43	49 1/2	17
August	235	10,042	47	53 2/7	2
September	234	8,419	48	45 1/4	7
October	198	10,133	30	60 1/3	7
November	177	8,832	39	64	8
Totals	1,973	86,194	430	....	79

WELLS DRILLED IN ILLINOIS DURING 1910 BY COUNTIES

County	Wells Completed.	New Production, bbl.	Dry Holes.
Lawrence	606	55,435	88
Crawford	1,133	25,222	238
Clark	107	1,700	30
Cumberland	15	162	2
Edgar and Coles	6	65	2
Marion	53	3,540	23
Miscellaneous	53	70	47
Totals	1,973	86,194	430

On January 1, 1910, it was estimated that 16,497 wells had been drilled in Illinois. Of these, 2379 were barren of oil. In the first eleven months of 1910, 1973 wells were drilled, with 430 barren wells, bringing the totals up to 18,470 wells drilled and 2809 dry holes. The following brief table shows the progress of development since 1906:

Year.	Wells Completed.	Producing Wells.	Initial Output, Bbl.	Average Yield Dry Wells.	Average Yield Per Well, Bbl.
1906	3,283	2,793	113,012	490	40.0
1907	4,988	4,260	139,163	728	32.6
1908	3,574	3,019	78,960	555	26.1
1909	3,151	2,593	89,756	†558	34.6
*1910	1,973	1,543	86,194	430	55.8

*Eleven months.

†Seventy gas wells included.

The Ohio Oil Co., representing the Standard Oil Co., controls most of the Illinois production. It has recently bought many large properties such as the Jennings interests, Parker and Edwards, Riddle Oil Co., Brown and Hogue, The Lee Oil Co., and others. The company has two 8-in. and one 12-in. pipe-lines from the field to the East, and one 8-in. line across the State to Alton, on the Mississippi river, where a large refinery was built in 1908. The Tidewater company has an independent 8-in. line to the East.

Reviews by States and Districts

ALASKA

The annual report on the mineral resources and production of Alaska for 1910 is now in preparation under the direction of Alfred H. Brooks, of the United States Geological Survey. The more important features of this report relating to the mining development during the year are abstracted below.

The value of the mineral output of Alaska in 1910 is estimated at $17,400,000; the value in 1909 was $21,146,423. Of this, the estimated value of the gold output in 1910 was $16,360,000; that of 1909, $20,371,078. The copper production in 1910 is estimated to have been 5,600,000 lb., valued at about $740,000; that of 1909 was 4,124,705 lb., valued at $536,211. The value of the other mineral products, including silver, lead, gypsum, marble, and coal, is estimated at $300,000—an increase over that of 1909. The total value of the Alaska mineral production since 1880, is $186,000,000, of which $179,000,000 is represented by the value of the gold output. The decrease in the value of the mineral production is entirely chargeable to the falling off in the output of Fairbanks, Seward Peninsula, and some of the smaller placer districts. Except in these camps and the coalfields, the output from all the mining districts increased. In spite of the decreased gold production and the handicap because of the delay in opening the coalfields, considerable advancement was made in the mining industry. Copper mining was prosperous and much development work was done on the copper deposits. More has been accomplished than in any previous year in the development of auriferous lodes. Much work was also done toward installing large mining plants for working low-grade placer deposits. The value of the output of the gold placers in 1910 is estimated at $12,000,000; the value of the output of 1909 was $16,200,000. Though much of the richest placer ground in the older districts has been worked out, there still remain enormous bodies of auriferous gravels the value of which is too low to permit exploitation under present conditions. Although there is still much unprospected ground in the several gold-bearing districts, it does not follow that the placers found in the future will be as rich or as extensive as those that have been developed in the past. The best prospect of permanency in the placer-gold output lies in providing means for economically mining the gravels of less value. Until this has been accomplished it is to be expected that there will be large fluctuations in the annual gold output. The year 1910 saw considerable activity in enterprises looking toward this end, more especially in dredges. Aside from these large enterprises the most important events in the placer-mining industry were the advancements made in the Iditarod region and the discovery of the Squirrel River placers in the lower Kobuk basin. There was also a marked advancement in prospecting in the Beaver Creek region, where encouraging results are reported. The marked advancement in lode mining in many parts of Alaska during 1910 is the most encouraging feature of the industry. This is in part reflected by an increase from 1909 in the production from gold lodes estimated at a value of about $300,000 and an increase in the copper output of nearly a million and a half pounds. More important to the future of the lode-mining industry, however, is the amount of dead work and prospecting accomplished in the various regions. Notable advances were made in the gold-lode districts of Juneau, Prince William Sound, Kenai Peninsula, Willow Creek of the Susitna Basin, and Fairbanks, and in the copper-bearing districts of Prince William Sound and the Chitina valley. There were 13 productive gold-lode mines in operation in Alaska in 1910, one more than in 1909. In addition to this, work was done on more than 50 gold prospects, a few of which produced some gold as an incident to the development work. Of the producing mines, six were in the Juneau district.

There were seven productive copper mines in Alaska in 1910, this being the same number as in 1909. The copper production is about equally divided between Prince William Sound and the Ketchikan district. There was a small increase in copper output of the Ketchikan district and a large increase in that of Prince William Sound in 1910 as compared with 1909.

ARIZONA

By C. F. Tolman, Jr.

During 1910, copper, king of Arizona, has been given a greatly depreciated rating, and consequently his kingdom has felt the effects of this unfortunate state of affairs, but just as the debasement of silver, years ago, proved in some respects a benefit to Arizona by turning the attention of the miner to the more valuable and lasting deposits of copper, so in a number of ways the depreciation of copper has indirectly been of some value. It is beginning to be recognized that in the mining of large low-grade orebodies, especially those of copper, the ordinary law of supply and demand is reversed. A low price for copper stimulates a large production in the attempt to make a profit, and at times of great demand and high prices, the productive capacity of the reduction plants is diminished by the large amount of low-grade ore that is treated because it then becomes profitable. One copper mine of Arizona is reported to have skimmed its milk by making large shipments of 18% ore to its smelter in the endeavor to keep even with the market. The extension of the application of copper to new purposes is hindered by fluctuating prices. These lessons once learned, the proper kind of 'copper combine' can be formed. The mining industry, more than any other, has profited by modern labor-saving devices. New machines and new methods of mining have been invented to reduce costs. This is due to the forced competition of lower-grade, or smaller, mines against higher-grade, larger, or more favorably situated properties; especially is this true among copper mines. The waste and carelessness that develop wherever competition is stifled are real dangers today, and the mining industry can teach us lessons along these lines. Slack times in Arizona have almost killed the wild-cat, and optimists have even dared predict that the cat will never completely recover. If this prove true, then a large item will be added to the profit side of the ledger. The development of prospects is now being carried on by individuals rather than companies, by men who know how to properly weigh the return of the gamble. Engineers, miners, prospectors, and at last the public, are recognizing the injury done by stock companies developing prospects, with the accompanying misrepresentation which must be made to cause the simple to part with their money. In the future, development must be done by individuals or special companies, that frankly explain their purposes and the chances they take. Formerly wild-cats alone were held up to criticism, but now the public is being informed that the injury wrought by overvaluation of good mines is still more serious, accompanied as it is by systematic withholding of information from the public, falsification of reports, and cold-blooded stock manipulation. The sheep have been sheared so closely at home that copper manipulators are quite active in Europe at present.

Turning to the Arizona copper camps: At Bisbee the Shattuck & Arizona has done all that the developments of the preceding year suggested. At Globe the Old Dominion is reported to have had excellent returns from its recent developments toward Pinal creek, a region which has been somewhat avoided for fear of increasing the flow of mine-water. The 'disseminated coppers' had previous to this year uncovered such tonnages that the increases in the official estimates are not of interest to the public. The splendid Miami mill, if not running before this is published, will certainly be operating soon after, and its larger neighbor at Hayden will follow soon. The disappointment furnished by certain of the Globe disseminated deposits, which to casual examination presented

attractive surface showings, suggest that there is still room for educating operators to the value of detailed geological examination in place of the easier method of a glance and a guess. The shutting down of the Imperial mines at Silverbell and the smelter at Sasco, has been a blow to all mining activity in the southern portion of Arizona, but the company has continued its explorations of the disseminated-copper deposits in porphyry and granite, the results of which are reported to have been satisfactory to the management. The Prescott, and western Arizona gold belts have suffered less than the copper fields, but no large new producers have been brought in. Arizona shares in part the dry-placer excitement which started in Sonora, due in large measure to the successful operation of the Quenner pulverizer. As has been described a number of times in the recent technical journals, this machine beats the cemented gravels by rapidly-revolving chains, and solves the problem of cracking the cement off the boulders of the indurated conglomerate, with a minimum expenditure of energy, and a large capacity for each machine. The placers of northwestern Sonora and southwestern Arizona are formed in the accumulations of débris washed down from low desert mountains composed of pre-Cambrian schists, gneisses, and granites, limestones mainly of Paleozoic age, and post-Paleozoic granites and other intrusives (the mineralizing agents). All these formations carry gold, especially the granites and gneisses, which are found reconcentrated in the desert gravels, not only near the surface, but in deeper channels, which in places are thoroughly cemented with the calcareous cement of the semi-arid region. Large amounts of gold have been taken from these deposits by Indians and Mexicans with the most primitive methods, but all attempts with modern plants and water concentration have failed. The Quenner pulverizer and the Mexican dry-washing machine may accomplish what more pretentious plants have failed to do.

AUSTRALIA

Until a few weeks ago it seemed as if the year 1910 would pass without a single mining discovery of importance being recorded in the vast extent of Australia. When it is remembered that the continent is as large as the United States and that settlement has only extended practically to 200 miles from the seashore, it can be understood that there are vast areas awaiting development. The drawback to the country is that a very large portion of it consists of arid territory. Prospectors, unless they are equipped to meet the greatest hardships, cannot penetrate safely into the greater portion of it. Consequently a large part of Australia is absolutely unexplored. It has merely been entered by the prospector, who has then had to retreat, baffled by the difficulties that he has had to face. Consequently the extent of mineral territory brought within the range of practical working expands slowly. Another natural disadvantage is that Australia is old geologically, and erosion has proceeded to such an extent that the ancient formations, those likely to carry minerals, are obscured by recent drift, and many of the mineral deposits are discovered only by accident. A case in point was the recent discovery of gold-bearing formations in the Yilgarn district, in Western Australia, which has occasioned a world-wide interest, in view of the richness of the neighboring field of Kalgoorlie. It is hoped that a goldfield of similar extent has been discovered at Yilgarn. The country is almost flat. In many places there is a hard surface cement, and it is only where an outcrop occurs that there is the slightest indication of quartz veins or other gold-bearing formation in a mineral belt 40 miles in length. On one side is granite and on the other greenstone, probably diorite. Along this belt, as is pointed out by the State mining engineer, the greenstones are found sheared and silicified, there being abundance of jasper and hematite, especially close to the granite contact. These zones have been fractured by earth movements with the subsequent formation of bodies of auriferous quartz. It is in this area that the Bullfinch mine was found. Half of it was sold for £1000; within a month such richness of gold had been exposed, and imagination of the public had been so wrought up by the stories told of this wealth, that an offer of £500,000 was made for the property. This discovery resulted in the greatest boom that has taken place since the days of Kalgoorlie. 'Wild-cats' innumerable sprang up, and it is certain, despite all the speculation that has resulted, that a fine mineral belt is about to be developed in this region. Unfortunately, no other mineral discovery of importance has been made in Australia within the year. This arises, in part, from the prosperous state of the pastoral and agricultural industries, in which fortunes have been made, and in the utilization of land suitable for the growth of cereals, or for sheep-runs. No such inducement has stimulated the mining industry. The price of base metals has been low, and the cost of gold mining has been high. This is because of the high rate of wages, the greater depths attained in the mines, and the refractory character of many of the ores worked. Still, at the present time, the mineral industry of Australia is merely dormant. The country is too vast, and its mineral possibilities too great, for the industry to long remain quiescent. As it is, the production is nearly £23,000,000 per annum, so mining really stands next in importance to the vast pastoral and agricultural industries.

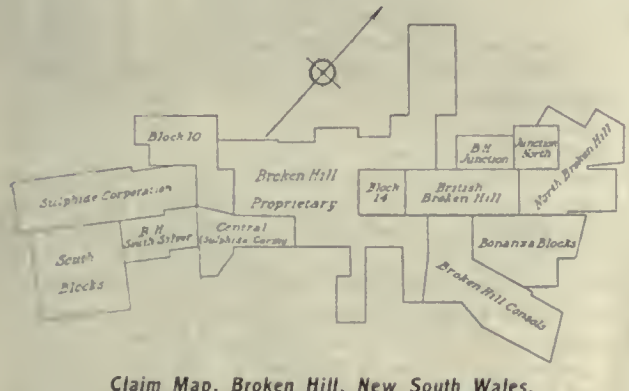
So far as gold mining is concerned, the old fields show declining yields. Taking them in the order of their importance, Kalgoorlie unquestionably is not the Kalgoorlie of old. The mines there, largely under the control of American engineers, have been worked on a large scale, quite in contrast to the more steady and slower policy of the Australian mining engineer of the eastern slope. Consequently, in Kalgoorlie, huge plants are at work and these have already dealt with all the high-class ore. With depth the ores of lower grade are still extensive. To make up for the lower grade of the ore mined, extra battery capacity has been provided, but the output of the field, nevertheless, shows a falling off. The compensating factor has been the reduction in costs, and it is wonderful how far the American managers have been enabled to accommodate themselves to the drop in the grade of ore. Still, that cannot go on forever, and without being unduly pessimistic, it is certain that the Kalgoorlie goldfield will continue to show a shrinkage of yield. Other parts of Western Australia have not so far furnished any gold-bearing resources to compensate for the decline in this centre. Whether the Bullfinch area in the Yilgarn district will do so, remains to be proved. In the eastern States of Australia the gold yield is also dwindling, but somewhat more slowly. Starting with Queensland, a great deal of the development at Charters Towers promises substantial results during 1911 should the formations that are being prospected at great depth prove to be payable. Gympie is dull, but there is some prospect of a revival in the Etheridge field, now that the Chillagoe company has extended its operations there. Mt. Morgan is becoming annually more important as a copper mine. Still its gold yield is no unimportant factor in the returns of the eastern Australian States. New South Wales, South Australia, and Tasmania do not count as large gold producers. Victoria, however, still outputs gold at about the same rate. It has been helped by a revival in alluvial mining and is being assisted still more by the development of side-zones in the Bendigo field. Hitherto mining has been confined largely to the Hustlers, New Chum, Garden Gully, and Moon zone. On some of these mining has been carried on to well over 4000 ft. in depth. At the present time sinking in the Victoria Consolidated on the New Chum zone has reached 4600 ft., and it is intended to go to 5000 ft. The State is aiding this work in the hope that the highly auriferous saddle formations developed in the upper levels of this mine will be repeated at great depth. Much more promising than this work is the outlook for side-zones of which there are several still undeveloped since surfacing was done on them in the old days, often with profitable results. E. J. Dunn, the Gov-

ernment geologist, holds that Bendigo, because of its extensive system of saddle formations on distinct lines, has a century's work ahead of it. The Australasian gold yield for the year 1910 can be approximated and compared with that of 1908 and 1909 as follows:

	1908.	1909.	*1910.
	oz.	oz.	oz.
Victoria	676,005	646,672	581,989
New South Wales	224,792	204,709	193,453
Queensland	461,359	450,937	434,785
Western Australia	1,648,505	1,595,263	1,460,514
South Australia	9,162	7,420	7,400
Tasmania	60,712	44,670	44,400
Totals	3,080,535	2,949,671	2,722,541

*December returns estimated.

The progress in copper mining has not been as great as was hoped for. This arises from the low price of the metal. The Mt. Lyell company in Tasmania is still the largest producer, its bonanza mine, the North Lyell, having been developed to 1100 ft. At that level the shoots of ore followed down from the 850 and 1000-ft. levels are less extensive, but above the 850-ft. level the ore-shoots were found to have pinched. It is hoped that another expansion of the mineralized zone will be found. However, the mine still has years of work ahead. The Mt. Balfour field has not come up to expectations and the boom is dead. In Australia proper the Mt. Morgan mine is close at the heels



Claim Map, Broken Hill, New South Wales.

of the Mt. Lyell. The high percentage of gold in its ore and the extent of its recources make it the greatest mine in Australia, and one of the most important in the world. It is now using pyritic ore from the Many Peaks mine, and so will cheapen costs and increase its output. Then, in north Queensland, the Cloncurry mines, like the Mt. Elliott and the Hampden, have developed large reserves of high-grade copper ore carrying gold. These mines, at an early date, will be dividend-paying and will put north Queensland in the lead of Australian copper producers, at least as far as any single district is concerned. British capital has done most to develop this part of Australia.

Tin mining is still an important industry, but it is slowly declining, owing to the steady depletion of the alluvial deposits. The New South Wales output has helped substantially by the use of dredges. In Tasmania, the Mt. Bischoff looks better than it has for years, and the deep levels are producing well, but the industry, as stated, is lagging. The same applies to the industry in Queensland. There, however, is found a formation carrying about 1% of tin which may yet be worked with profit.

Lead and zinc mining is still practically confined to the great Broken Hill field. The Broken Hill Proprietary Co. refuses to re-open its mine, notwithstanding that it has about 4,000,000 tons in reserve, until the price of lead is higher. Its neighbors, the Block 10 and Block 14, are within sight of exhaustion, but to the south the Sulphide Corporation and the South mines, working on the pitch of the great shoot of ore from the Proprietary's southern leases, have developed splendidly. The South Blocks, an English company, is doing very well, and the South Extended is opening a new orebody some distance south of the principal mines, and may develop another productive area. At the north end of the field the event of the year has been the remarkable cutting out of the shoot of ore worked by the Junction North mine. What effect this will have on the fate of the important North mine remains to be proved by actual work, which must determine whether, as it is on the pitch of the shoot, it will suffer similarly. Looking at the Broken Hill mines today, it can be said that in the leading mines there are ore reserves sufficient for 5 to 14 years. Still, just as the North has to consider whether it will find a contraction in the orebody it is developing, so the mines at the south end of the field have to determine, as work progresses, whether the orebody contracts in their leases as it has in Block 10 at depth.

The other great mineral industry is coal mining. There can be no question as to the extent of the resources of New South Wales and Queensland. But the New South Wales coal miner is a socialist and a person prone to quarrel on the least pretext. He caused the Newcastle field to become idle twelve months ago, and the result was that the collieries have suffered seriously in their over-sea trade. An excuse was also given to the Victorian government to start a State coal mine at the Powlett, where a large seam was discovered. So the coal industry in New South Wales is stagnating and collieries are being shut down. Because of this, another strike is threatened and the naturalization of the miners is demanded. As labor is paramount in Australia just now, no one can tell what will happen.

BRITISH COLUMBIA

The ore production of southeastern British Columbia for the year 1910 is estimated at 2,240,000 tons, which is an increase over 1909 of 50,000 tons. The valuation of this production, approximately, is $17,750,000, an increase over the preceding year of $350,000. The Boundary and Rossland districts will show an increased output, while the Slocan-Kootenay will show a slight decrease, owing to several big producers being closed down or only operated part time. Mining in Rossland district has progressed slightly. The Granby, interesting itself in the Cliff-St. Elmo group and putting a force to work, has had a stimulating effect. The Blue Bird was re-opened by its Spokane owners; the Mayflower, Nickel Plate, I. X. L., Lily May, and other small properties, worked; and an increased production was shown by the Centre Star-War Eagle, Le Roi No. 2, and the Le Roi mines. At the Centre Star group, work was carried on steadily all year. The ore reserves at the end of the year, after shipping an increased tonnage over last year, prove about 246,000 tons. A new rich ore-zone was opened in the War Eagle mine, while development of the Iron Mask and Idaho claims of this company resulted in discovering new ore. At the Josie mine of the Le Roi No. 2, Ltd., the work of sinking the main shaft from the 900 to the 1300-ft. level was completed, and the continuation of the North Annie vein was found. The company made a normal production and paid three dividends of 50c. per share each. The year closes with 18 months' ore in the reserves. Work was also started on the Surprise claim of this company in an effort to enter the ore-zone existing on the War Eagle. The Le Roi mine was not worked steadily, though it made an ore production of 2000 tons in excess of 1909. The company has gone into voluntary liquidation, and the mine and plant are for sale. In November and December there were rumors that they would be bought by a strong company. Granby engineers have been through the mine, but there is nothing definite known yet. At the Trail smelter and refinery the amount of ore and concentrate treated amounted to 456,750 tons, as compared with 432,450 in 1909. The value of this product is close to $6,000,000. The Consolidated M. & S. Co. during the year acquired the Number Seven and Molly Gibson mines and shipped regularly from its Centre Star-War Eagle, St. Eugene, Snowshoe, Richmond-Eureka, Sullivan, and other mines. In the Boundary district the Granby company made a production of over 1,000,000 tons

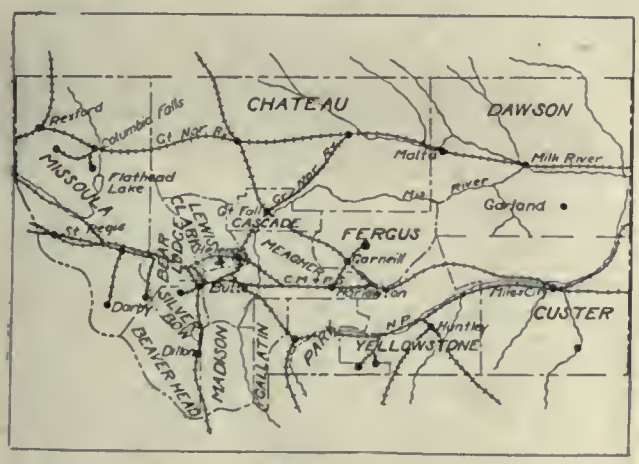
of ore, and it is estimated that $4 per share was made by the company during the year. One dividend of $1 per share was paid in December, and the company had nearly $1,000,000 cash on hand at the end of its last fiscal year. In April, Otto Sussmann examined the Phoenix mines of the company and reported 6,000,000 tons of ore in the reserve, which caused a drop in the company's securities. The Hidden Creek mine, Observatory Inlet, was acquired at a cost of $400,000 for an 80% interest. A fire occurred at the Phoenix mines in August which destroyed the machine-shop, oil-house, and No. 3 outlet. The old buildings were replaced with new brick and steel structures, equipped with heavy modern machine-shop tools. The company also acquired the Cliff-St. Elmo group at Rossland and placed compressed-air power on the property, beginning actual development. The British Columbia Copper Co. made a steady production, except in the month of May, during which there was a strike of the miners in Greenwood. This concern enlarged its Greenwood smelter, placed its Jackpot mine on a shipping basis, as well as the Rawhide mine of the New Dominion Copper Co. A tramway is being built from its Lone Star mine to Boundary Falls, at a cost of $75,000. At Hedley, the Hedley Gold Mining Co. spent nearly $100,000 for additional boilers, engine, generator, water-wheel, motors, tube-mill, Deister tables, and filter-presses. An increased tonnage of ore was made, and $144,000 was paid in dividends. In September the Kingston group at Hedley was bonded by the Redeemable Trust Co. of Boston. At Princeton the Princeton Coal & Land Co. made additions to its coal-handling and ventilating plant, while the Osoyoos Coal Mining Co. worked a small force at diamond-drilling on its 15-ft. coal seam. At Granite Creek the Columbia Coal & Coke Co. put in a 100-hp. steam compressed-air plant, and rock-drills to drive on its bituminous coal.

In the Nelson district the Silver King was operated under lease until June. The Athabasca was worked during the year; and the Granite-Poorman mine and mill were operated at a profit of $30,000 to the owners. The Dominion Government appropriated $50,000 for experimental work, toward solving the zinc problem of this district. The French Complex Ore Reduction Co. also built an experimental plant at Nelson and will run some tests next year. About $350,000 was paid as bounty to the lead miners this year, the rate of bounty being $15 per ton. Some mining property changed hands in the Sheep Creek district, including the Clyde-Belt group, Vancouver, Davenport, Eureka, and Kootenay Bell. The final payment on the purchase price of the Queen mine, $175,000, was made, as well as the final payment on the price of the Nugget mine, $40,000. The 20-stamp mill at the Queen worked all year on ore averaging $12.16 per ton. The 4-stamp mill on the Nugget was also worked steadily; and the blocking-out of ore on the Mother Lode was carried on. The vein in this mine has proved-up well, and a millsite is being cleared for a 50-ton concentrator, about to be ordered. Compressed air was used at the Mother Lode from the Queen system, carried through a 4-in. pipe 10,000 ft. long; four 3¼-in. drills and two hammer-drills were installed. The Yankee Girl Gold Mines at Ymir has a new 7-drill compressor and four drills. The company's production shows an increase of ore over that of last year. This ore averages $21.21 per ton; and the mine contains a large tonnage of $9.50 ore for which a concentrator may be built next spring. The Dundee Gold Mines Co. installed a small air-compressor and drill, the Wilcox mill produced a small tonnage of concentrate, the Second Relief mine and mill were operated at Erie, and work was resumed on the Big Bump. In the Slocan-Kootenay district ore shipments were resumed at the Sullivan mine after a long shut-down. The Slocan Star also resumed shipping. The Blue Bell mine and mill were operated until March only. A forest fire in August interrupted work at the Rambler-Cariboo, Lucky Jim, and other mines in the Kaslo district. The Lucky Jim company later put in a five-drill compressor and will continue development work this winter. The Rambler-Cariboo compressor plant was working again in September, and the ore will be hauled to Three Forks this winter, to be shipped over the Canadian Pacific railroad, as the Kaslo & Sandon railway bridges were burned. In the Standard mine at Silverton the ore widened in No. 5 tunnel to 30 ft., 24 ft. of which was of shipping grade, carrying 70% lead and 70 to 100 oz. silver. A sale of the property at $400,000 was recently reported. The Van Roi has a new vein and the 100-ton concentrator on Four-Mile creek is nearly finished. The North Star mine paid a dividend of 2%, amounting to $26,000. The Crow's Nest Pass Coal Co. has produced as high as 6200 tons of coal per day, but the output has now dropped to about 5000 tons. Two dividends were paid during the year amounting to nearly $125,000. The Corbin Coal & Coke Co. and the Hosmer Coal Co. both made average productions. The Canadian Geological Survey parties worked in the Slocan this year, and made a topographical and geographical map of Franklin camp; also a similar map of the Mother Lode and Sunset ground near Greenwood. The Sullivan mine was mapped in east Kootenay, and the Atlin country, Portland Canal, Vancouver Island, Tulameen, Hazelton, and Babine mining districts were covered.

BUTTE, MONTANA

Important events have marked the progress made by the mining industry in Montana during 1910. The merger of the leading copper-producing companies of the Butte district, was brought about during the year, whereby the Anaconda, Boston & Montana, Butte Coalition, Butte & Boston, Washoe, Original, Trenton, and Parrot mines, formerly operating independently, are now operated under the name of the Anaconda Copper Mining Co. The merger was probably the most important move in the copper-mining industry during the year. There are a number of independent companies still operating in Butte, but at least one of them, the North Butte, will eventually be taken into the Anaconda merger. The other independents include the East Butte, Elm Orlu, Tuolumne, Butte-Ballaklava, Butte & Superior, and the Butte Central Copper Co. The merger of eight of the principal copper companies has made possible the introduction of economies in a number of departments; and whereas the average cost of production of the eight companies had been close to 11c. per pound, the cost under the merger was reduced to 9c. per pound. This low cost, which included operating expenses and a liberal allowance for depreciation, was maintained until the policy of curtailment was adopted. It is not possible to reduce the working forces in the Butte mines greatly without a complete shut-down of some properties, and with the mining costs only slightly reduced and the output cut about 15%, the cost of production necessarily increased again, and for three months or more Anaconda costs have been about 10c. per pound, with copper delivered at the seaport. Changes are being made to introduce further economies, and for greater concentration of operations which will bring costs so low, according to the claims of Anaconda engineers, that no fear need be felt that any other district in the world can do better. The installation of the new hoisting plant on the Anaconda hill is aimed to be a step in the line of cost reduction. The plant will not be ready for use for several months. Electricity will be applied for hoisting purposes at three of the mines of the Anaconda company. Hoisting will be done with compressed air from electrically-driven compressors. The installation of the new plant referred to cost $400,000, and it is estimated that by its operation the cost of hoisting will be reduced to one-third the former figure. Electric pumping-stations are also being installed in the mines. In addition to the surface improvements being made by the Anaconda and other companies, much development is being done in the mines. The Anaconda company is sinking three new four-compartment working shafts, one each at the Badger State, Gagnon, and Belmont mines. The shaft on the last named is in the southern part of the district, and will eventually become the main

working shaft for all the Anaconda hill mines, with the workings of which it is being connected. The purpose of the new shaft on the Gagnon is to replace the old incline, to be used only as an air-shaft when the new one is completed. The Gagnon shaft will be sunk to a depth of 2300 ft., and is down about half that depth now. Some rich orebodies have been opened at that depth in the Gagnon mine. The Badger State is being developed into one of the most important properties in the district, being the farthest north of any of the copper mines. It has been opened to a depth of 1800 ft. and regular shipments of several hundred tons of ore per day were begun a short time ago. The North Butte Mining Co. has been devoting more time to mining and less to stock markets recently, with the result that the property is coming into its own again. The lowest level opened is at 2200 ft., and a station is now being cut at 2400 ft. During the copper boom days the North Butte mined and shipped about 1500 tons of ore per day and turned out about 3,000,000 lb. of copper per month. The management then had its eye on the stock market and kept all information to itself until the rich orebodies appeared to be exhausted and the insiders had unloaded their stock. Those were the days when the stockholders were ignored, and the officers of the company used to tell the seekers for information and publicity that the public and the newspapers made them tired. After



Montana.

the crash, there was a different tune, and now the stockholders are furnished with quarterly mine reports, and the affairs of the company are more open to the public. The company is shipping now about 1000 tons of ore per day, but the copper production is under 2,000,000 lb. per month, the cost of which is about 10½c. per lb. The East Butte Copper M. Co., owner of the Pittsmont mines and smelter, is the most important company outside of Anaconda influence. It is making about 1,000,000 lb. of copper per month at a cost of about 10c. per lb. The most important discovery of copper ore made in the district in several years was made in the Pittsmont a few months ago. The new orebody was opened on the 800-ft. level, and is several thousand feet in length, and has an average width of 38 ft., the ore from it, so far as mined, assaying 7% copper and about 6 oz. silver per ton. The Tuolumne is another important producer and may develop into a dividend payer. The company has settled its litigation with the North Butte company and is now in position to do profitable mining, several remarkably rich orebodies having been opened. The property has been opened to a depth of 1400 ft., and has good equipment; but the directors, as soon as the litigation was settled, announced their intention to put up a new hoisting plant at a cost of $200,000, and to sink the shaft 2500 ft. deep. It is officially stated that there is no intention of paying a dividend soon. The Butte Central Copper Co., owner of the Ophir mine, has developed that property extensively, and, according to estimates, has 1,000,000 tons of ore in sight down to the 500-ft. level. The ore contains considerable silver and gold, and a 100-ton concentrator is to be built next spring. The Butte-Baliaklava Copper Co. developed a large body of high-grade copper ore on the Burke and Baliaklava claims, but after it had started to ship ore and produce copper at the rate of 600,000 lb. per month, the Anaconda company stopped work by injunction, claiming that the orebody belongs to the Mountain Chief, one of the Anaconda properties. While the orebody in question is tied up, the Butte-Baliaklava company is developing other veins in its ground. W. A. Clark has been working only two properties in Butte since he sold the Original and Stewart groups to the Anaconda company. These are the Elm Orlu, a zinc producer, and the Poser, which yields copper ore; although the old Moulton mine, a silver property, is being placed in condition for mining again.

The result of the copper curtailment cut the 1910 production of the Butte district about 26,000,000 lb. below that of 1909, but it is still about 12,000,000 lb. more than 1908. The monthly production in pounds for the last two years follows:

	1910.	1909.
January	19,224,250	26,502,600
February	13,755,620	24,871,730
March	24,757,700	28,077,510
April	25,087,200	25,347,420
May	28,363,760	26,443,244
June	26,356,200	25,187,780
July	24,303,500	26,580,820
August	24,762,800	26,061,140
September	22,990,050	26,584,180
October	22,913,781	28,166,166
November	23,636,550	27,649,140
December	22,879,116	14,675,880
Totals	279,030,527	306,147,610

Outside of Butte more prospecting and development was done in Montana during 1910 than for several years. The most important results were achieved in the Georgetown and Southern Cross district, Deer Lodge and Granite counties. It is estimated that half a million dollars in gold was taken out of that district in the past six months. The Southern Cross mine, upon which the Guggenheims had an option for $900,000, has ore that is hard to treat, and for this reason the option was allowed to lapse. The Cable mine is in the same district, and has also been a steady producer for 20 years. The Conrey Placer Mining Co., in which Harvard University is interested, is extending its operations at the mouth of Alder gulch, and is just completing its fourth dredging boat, which will be one of the largest dredges in the world and will cost $270,000. It will have a capacity to work 8000 cu. yd. of earth yer day. The dredge is 150 ft. in length, 58 ft. wide; will work to a depth of 55 ft. below the water-line, and has a chain of 86 buckets, each capable of lifting 16 cu. ft. of earth. The machinery will be operated by electric power. This company is working in ground that yields 17c. per cubic yard at a cost of 5c. per yard. In the Helena district, the Jay Gould mine and 40-stamp mill are in operation, and the old Belmont mine is being explored for new orebodies. In the Radersburg district the Keating is employing 85 men and shipping ore to the East Butte smelter. The Black Friday, in same district, is also shipping ore. It is probable that a railroad will be built from Toston to Radersburg in the spring. The Barnes-King company has again ceased operating its mine at Kendall in Fergus county. As the company has about $300,000 in its treasury, the directors are looking for a new property, and there are reports that they will purchase the Santiago mine, adjoining the Barnes-King, or the Kendall property nearby. It is estimated that the gold production of Montana in 1910 was about $4,500,000, an increase of $500,000 over the production of 1909; the value of the silver production of 1910 was $16,000,000, against $15,125,000 in 1909; the estimated value of the 1910 copper production is $36,400,000. The State produced considerable lead and zinc, and some tungsten, besides its output of sapphires and other precious stones, which was important.

ELY, NEVADA

The best record ever made by a new company in the copper business is that of the Nevada Consolidated, of Ely, which for 1910 produced, approximately, 65,000,000 lb. of blister copper, as against 43,000,000 lb. in 1909. During the past six months, in harmony with other large companies, it curtailed production about 20%. Had it continued at full capacity for the entire year, its output would have been increased about 10,000,000 lb. The company has demonstrated its ability to make copper at the lowest cost of any company operating in the United States or Mexico. The cost of its output for the year averaged a little less than 7c. per pound. During the months when the plant was running to its full capacity the cost was 6.44c., and this would have been maintained for the balance of the year had not the order been issued for the curtailment of output. The gross earnings of the company for 1910 amounted to $3,609,000, which stands without a parallel in the history of copper mining, considering the age of the company and the low price of the metal for the year. This marked success was due both to the great magnitude of the sulphide ore deposits and to steam-shovel mining at the minimum cost. During the greater portion of the year six steam-shovels were employed, four on overburden and two on ore, but owing to the fact that the rolling-stock was somewhat limited the machines were not worked to their full capacity. During December three dinky engines arrived, and will soon be engaged in and near the pits, making ten engines engaged in that class of work. This, however, will not affect the output of ore from the pit, which is limited by the capacity of the Steptoe concentrator, which can be easily served by two steam-shovels. When the eight sections of the concentrator are in operation, from 9000 to 10,000 tons of ore per day are treated, though between 11,000 and 12,000 tons have been treated within 24 hours under the most favorable conditions. During the year the exploration of new territory has been continued by churn-drill operations, with the result that the net gain over extraction has been more than 11,000,000 tons, which, added to the ore reserves previously demonstrated, gives the total of more than 40,000,000 tons of commercial ore. It will require many years of churn-drill exploration to demonstrate the ore reserves in other territory owned by the company. The output for the year 1911 will doubtless depend largely upon the price of the metal. Should the price continue to advance a much larger output than last year may be expected, and this can be accomplished without material increase of cost, because additional rolling-stock has been provided at the pit, and much necessary dead-work was done during the year on the new Liberty pit, which can soon be drawn upon for additional supply of ore.

Next to the Nevada Consolidated in area owned and tonnage of ore demonstrated, is the Giroux Consolidated, which is yet in the development stage, but it is estimated that it has 25,000,000 to 30,000,000 tons of the highest-grade ore in the district. Much of the sulphide ore of the Giroux company lies near the surface, affording ideal conditions for steam-shovel operations, similar to those of the Nevada Consolidated; but the ore is much higher in grade, assaying from 2½ to 7% copper. In addition to its sulphide ore the company has explored a large body of carbonate and oxide ore in its Alpha workings, sampling 10 to 15% copper, and also containing more gold than the Nevada Consolidated ores. This portion of the property has been equipped during the year with one of the largest hoisting plants in the United States, a technical description of which appeared in the *Mining and Scientific Press* in its issue of June 11, 1910. The new equipment will be in operation within a few weeks, after which the company will be able to produce ore that will stand the cost of transportation to Utah smelters. However, it is not probable that ores of this class will be shipped, as Thomas F. Cole, president of the company, has stated that a smelting and concentrating plant will soon be erected in the Ely district. The company did little development work during the year, aside from churn-drill prospecting, which proved satisfactory. The work of the year was confined mostly to sinking the new 5-compartment working-shaft in solid limestone. This shaft has now reached a depth of nearly 1400 ft., and a cross-cut is to be driven from the 1400-ft. station to the Alpha workings, a distance of 700 ft. Similar cross-cuts have already been driven from the 700 and 1200-ft. stations of the new shaft. The property is evidently ready to produce a large tonnage of high-grade ore, which apparently is in demand at the Tooele plant of the International Smelting & Refining Co. While it is evident that the Giroux company will soon enter the producing class, in the opinion of your correspondent, it will not do so until after it has erected its own concentrating and smelting plants. It is probable, however, that some of the high-grade ore from the Alpha workings, which it will be found necessary to raise to the surface in doing development work, may be shipped to the Tooele smelter for treatment.

GERMANY

The mining industries of Germany are practically summed up in two items, namely, coal and iron. The third, of international importance, is potash. Petroleum is obtained in considerable quantities, and other minerals in greater or less quantities are found. Unfortunately, the mining statistics, except for coal, are not published with such punctuality as are manufacturing statistics, although it might appear that the former would be the more easily made up. However, some idea of the production of iron ore may be got from the quantity of crude iron produced, although it is to be remembered that considerable foreign ore, notably Spanish and Scandinavian, is imported. The quantity of crude iron produced in the first ten months of the year amounted to 12,213,908 tons, November and December still to be accounted for. The ten months' production for 1910 is almost as much as that for the twelve months of 1909, and is greater than the twelve months' output of 1908. The figures for 1909 and 1908, respectively, were 12,917,653 and 11,813,511 tons. The total production for this year, as was explained at a recent technical meeting in Germany, will make about 14,000,000 tons, and this contrasts with about 500,000 tons in the year 1860. In an article appearing in the *Stahl und Eisen* in November, it is shown that the German iron ore reserves are estimated at 3,916,800,000 tons. The quantity looks large, but in view of the steady advance in consumption the prospective life of the iron industry in Germany would not appear to be a long one; but similar calculations can be made with respect to all the iron-producing countries in the world.

The quantity of coal extracted between January and September, inclusive, this year, made 112,740,266 tons, which compared with 110,339,981 tons in 1909, shows a substantial increase, and as the last winter was a warm one, the increase will appear all the more important as indicating a larger use in the industries. As to brown coal, there was a slight decrease in production, amounting in nine months to 49,930,607 tons this year, as compared with 49,999,987 tons last year. The most interesting element in German mining this year is that of potash, which has become one of international importance, both economically and politically. Early in the year the efforts to gather all the potash mining industries into syndicate form, embracing particularly those that had stood out in previous years, met with a good deal of success under the protecting influence of the Government, which introduced and ultimately carried into law a scheme apportioning to the various individual interests their shares in the general production of the country, especially as far as permission to export the product is concerned; the law sets certain fiscal limits to development, beyond which the product is liable to a 'super-contingent' tax. American readers are no doubt aware of the trouble that has existed between the American buyers and the German sellers, but they may not be so well acquainted with the fact that, owing to the protection afforded by the new potash law, this industry has become the pet field of the German company promoter and amal-

gamation organizer. Almost daily some new scheme is before the German financial world for exploiting the national potash reserves. One of the developments in the potash mining industry of some technical interest is that the law requires at least two shafts for each mine, but numerous concerns have managed to comply with the law by using each other's shafts, whereby two contiguous mines form an underground connection, thus avoiding the sinking of an extra shaft. This was the only way in many cases by which the extra shaft could be provided and the interested companies remain alive, for the cost of sinking a new one would have hopelessly crippled them. Sometimes the mere fact of connecting the shafts has not provided the safety contemplated in the law, and it is stated that the Government will intervene and require that all such connections shall be not only in existence, but shall offer all the adequate protection that it was the intention of the law to secure.

German petroleum production is always laboring under the oppression of outside competition, so that there is not much new to be said of it except that the reserves show considerable persistence. They have not had the brilliant history of the gusher fields of the Caucasus and other parts of the world. But many of the wells are showing long lives, and hopes are entertained that in Alsace the petroleum industry is on the eve of considerable extension. In round figures, the German oilfields produce 350,000 tons a year; and a monopoly is on the tapis. It should be stated that the German Government is said to be contemplating an extension of its proprietorship in coal mines, particularly in the district of Linden.

JOPLIN DISTRICT

While the year 1910 has not been a record-breaker, the production closely approximates that of 1909, both in lead and zinc, and the year was marked by increased and important mine development. With only two weeks to be reported, the zinc-ore shipments are but 5000 tons behind those of 1909, and with the surplus in the bins the actual production is equal to that of last year. This means a zinc production of approximately 300,000 tons, of which slightly more than nine-tenths is blende and the remainder calamine. This year there was a greater falling off in calamine than in 1909, and yet calamine ore prices averaged higher. The reverse was true of blende. In valuation the zinc product will approximate $12,250,000 for the year. With but two weeks to be accounted for, the total value of the blende has reached $11,316,897, and of the calamine $674,160. This shows a decrease from 1909 to $359,416. The average price of blende for 1910 to December 20 has been $41.89, and for calamine, $25.57, as compared with $42.16 and $24.02 in 1909. Lead shipments for 1910 will, it is believed, equal those of 1909. In production they will certainly surpass last year, for the year closes with a heavy surplus in the bins. With two weeks lacking, the present shipments total 42,146 tons with a valuation of $2,207,975. As compared with the same period of 1909, there is a decrease of $179,079 in value. It is already known that the last two weeks' shipments of lead for the year will be heavy, owing to purchases already made. The average price per ton has been $52.38 as compared with $54.82 in 1909. The year opened with zinc-ore prices strong at $46 to $49 base, but they declined gradually during January and slumped heavily the first week in February, continuing until in March, when a revival took place and prices for two months ranged between $40 and $45 per ton. With the coming of April they dropped again and the price went to $36 the last week in April; the lowest price for the previous twelve months. May, June, and July was a season of recuperation and steadier markets when $38 to $41 was the prevailing quotation. August showed a slump to $35, the lowest point of the year. Thenceforward the market advanced, until in November a $48 base was paid for some ore. December so far has shown another decline, and the fourth week shows prices of $38 to $42. To correct these lowering prices and stop the accumulation of further surplus stocks, there has been a general shut-down of many of the largest producing properties of the district for an indefinite period.

There have been some remarkable developments during the past twelve months in the opening up of new fields and the extension of already well known mineralized areas. In the north end of the district at the new camp on the north fork of Spring river, north of Neck City, much progress has been made. Some of the richest mines the district has ever known have been producing heavily here for several months. The developments promise to greatly extend that area in the immediate future. It is a territory of 'soft ground', immensely rich mines, and greatly resembles the old Badger camp in many respects. Another new area of great promise is the Toms Station camp, due north of Joplin and due west of Webb City, where a large acreage of ground has been well tested and some rich mines developed. This work is just reaching the productive stage and the amount of drilling done assures a large camp within another year. This, too, is an area of 'soft ground' and rich orebodies. Some of the largest mining companies in the district have entered this field and are engaged in its active development. West of Carl Junction is another area

The Missouri-Kansas Zinc and Lead Fields.

that attracted attention this year. The old Lehigh camp is being revived under the active management of the United Zinc Co. That company has taken leases over 280 acres in the very heart of this old camp and has been getting it ready for operation for some time. The work is now reaching the productive stage. In the west field new drill-prospecting has revealed a vast acreage of territory highly mineralized. This is all virgin land, and shaft-sinking is now in progress. The ore here is also of the 'soft ground' type. The old camps of Joplin and Galena show some new developments, especially at Galena. A number of milling plants of modern design have been built and production increased. Galena, too, has felt the activities of the Playter interests, for they, more than any other, have taken over leases and undertaken new work there. The development of the new deep-ore horizon has not gone far enough to test it. Two mills are now ready to try out the possibilities of this ore, and another six months should yield some definite knowledge. The most important development in new deep ground has been at Oronogo, where the Oronogo Circle Mining Co. has put down five core-drill holes from the 230-ft. level of its present working mine and discovered a stratum of ore that has probably a 44-ft. face averaging 12% zinc. It is in flint and limestone. This is the first successful core-drilling in the district.

LAKE SUPERIOR COPPER DISTRICT

By R. H. Maurer

As nearly as can be calculated at this time, the production of the Lake Superior mines during 1910 was 222,630,000 lb. fine copper, as compared with 233,364,273 lb. produced during 1909, and with an annual average production of approximately 200,000,000 lb. for the past decade. A table showing output every fifth year since production began in 1845 is appended:

Year.	Lb. Copper.	Year.	Lb. Copper.
1845	24,880	1880	49,718,337
1850	1,281,280	1885	72,147,889
1855	5,809,334	1890	101,410,277
1860	12,068,375	1895	129,330,749
1865	14,358,592	1900	142,151,571
1870	24,622,759	1905	230,437,992
1875	36,039,497	1910	*222,630,000

*Estimated.

As in the two previous years, low prices for the finished product prevailed, the average for the year being around 13.05c. per pound, which compared with 13.48c. during the preceding year with 13.51c. during 1908 and with 20c. during 1907. In 1880 copper sold for 21.43c., and in 1894 the average was but 9.52c. During the last decade the average annual price fluctuated between 12.16c. in 1902 and 20c. in 1907 and for the decade averaged 15.47 cents.

In consequence of low prices and the voluntary restriction placed on production, dividend earnings were reduced, though in most instances the reduction was slight. The year's disbursements amounted to $6,191,700 with seven companies contributing. These same companies disbursed $6,309,200 during the previous year, and in 1906, the banner dividend year, yielded in excess of $13,250,000 in dividends. The first dividend of which there is any record was one of $60,000, paid by the Cliff mine in 1849, and with this payment there began a dividend record such as no other district can show. The total amount yielded in dividends by the mines of this district now stands at more than $182,000,000. Against this amount there is charged a total of about $77,000,000 in assessments levied by the various companies that at one time or another attempted, and some of which are at the present attempting the development of profitable mines. Though success came to comparatively few, the money realized by these assessments was expended in honest endeavor, with a few exceptions. Several of the failures of earlier years have since developed into profitable producers, and one of them has a dividend record of $6,300,000.

Considerable attention was paid to the development of new territory which has added much to the known mineral resources of the district. The most important discoveries of new copper deposits were those made in the 'Lake district' in Ontonagon county, where the Lake amygdaloid was first opened in 1906. On several properties rich deposits were found by boring which has greatly stimulated activity there. Work of this nature was done along the belt from the Keweenaw Point to the Ontonagon river. The number of active companies was increased by several new organizations during the year and now totals 47, of which 17 may be classed as producers, the remainder being engaged in exploratory work or development. Among the more likely prospects which may be among the producers before another year passes are the Hancock, Winona, Ojibway, and Lake. The Indiana, South Lake, Algomah, Adventure, New Baltic, and Houghton have each succeeded in finding promising copper deposits and are now engaged with the development of these discoveries. None of the mines is threatened with immediate exhaustion, but in the case of a few the end is already in sight. The original Calumet mine will be worked out in possibly 12 to 15 years; also the Wolverine. In the meantime other producers are coming in and the productive limit of the district appears not to have been reached. The annual production averages slightly in excess of 200,000,000 lb. for the past decade, and the total output for the district exceeds 5,000,000,000 pounds.

An estimate of the production in pounds of fine copper of the several Lake Superior copper mines for the year 1910, also actual figures of production for the preceding year, are here given. Estimates are based upon the most reliable data obtainable. Official figures will not be available in some instances for several months to come.

Mine.	1910. (Estimated.)	1909. (Actual.)
Ahmeek	11,760,000	9,198,110
Allouez	4,850,000	4,031,532
Baltic	18,110,000	17,817,836
Calumet & Hecla.....	71,300,000	80,298,195
Centennial	1,600,000	2,583,793
Champion	19,360,000	18,005,071
Franklin	1,200,000	1,615,556
Isle Royale	7,450,000	5,719,056
Mass	1,600,000	1,723,436
Mohawk	11,470,000	11,248,474
Osceola	19,060,000	25,296,657
Quincy	21,750,000	22,511,984
Superior	3,150,000	1,485,646
Tamarack	11,560,000	13,535,207
Trimountain	5,730,000	5,282,404
Victoria	1,250,000	1,062,218
Wolverine	9,740,000	9,980,000
Miscellaneous	1,600,000	1,971,100
Total	222,630,000	233,364,273

Labor was plentiful, commanded fair wages, and despite outside agitation, worked in perfect harmony with itself and with capital. The number of workers was smaller than in the preceding year, and is now 19,000, of which quite 16,000 find employment in Houghton county, 2000 in Keweenaw county, and something like 1000 in Ontonagon county. The total a year ago was nearer 21,000 men employed in every branch of the industry in the three counties. Representatives of a Western labor organization early in the year attempted to unionize local labor, but met with little success, and in the end abandoned the attempt without attaining their object.

MEXICO

A review of the mining industry of Mexico in 1910 shows steady progress, with important gains along industrial lines. The opening of the year found Mexican mining investments, which had suffered from the prospect of unfavorable mining legislation, and the low prices of silver and copper, recovering favor in the United States and attracting attention in England and France. The Santa Gertrudis deal, pending during 1909 and definitely closed in January 1910, by which the Santa Gertrudis silver mines in the Pachuca district passed into British hands at a price of $9,000,000, served to stimulate interest in Mexican mines and strengthen faith in the future of the white metal. Later in the year Mexico profited by the advance in the price of silver, and in connection with the Centennial celebration the Republic favorably impressed the world. Had not the month of November witnessed anti-American rioting and revolutionary outbreaks—the latter having continued—the year would have ended with conditions generally satisfactory. That the disturbances, which have revived the old question, "After Diaz, what?" will affect Mexican investments to some extent is to be expected. But the revolutionary trouble has not assumed serious proportions; the Diaz government has shown its strength and can be depended on to preserve peace. And for several reasons, one of which is the very preponderance of foreign capital in Mexican enterprises, there is little probability of disturbed conditions enduring after the passing of Diaz. With Mexico ranking first among silver-producing countries, the price of the white metal is of surpassing importance, and the advances of the year just closed have resulted in increased activity in mining and milling. In January the average price of silver was 52.38c., and in November 55.63c. Only in February and March did the average fall below that

of January. In October it sold as high as 56⅞, and in November as high as 56⅝. In the fiscal year 1909-1910 silver to the value of ₱76,349,121.72 was exported from Mexico. Notwithstanding that the average price of copper remained below 13c. during the greater part of the year, the 1910 statistics will show that copper production in Mexico was well maintained. In the first ten months of the year the Cananea Consolidated Copper Co. produced 38,795,000 lb., as against 44,937,365 in the twelve months of 1909. The November and December returns are expected to raise the total above that of the preceding year. The Boleo Copper Co., of Lower California, which sends its output to Europe, produced 23,405,683 lb. up to the end of October. Owing to scarcity of water for concentration at the end of the long dry season, the Moctezuma Copper Co. will show a decrease in production for the year. The Teziutlan Copper Mining & Smelting Co., which dropped out of the list of producers following the slump in copper, to await better prices, blew in two 500-ton furnaces late in April, and has been operating during the greater part of the time since, although at much below capacity. The Mazapil Copper Co., of Zacatecas, another important producer, has maintained its average in 1910.

Government reports show a gold export of ₱42,636,399.29 in the fiscal year 1909-1910. Returns for the calendar year

Mexico.

are expected to show a gold production in excess of ₱45,000,000. The increase in Mexico's gold production in the last 15 years has been extraordinary. From ₱2,456,989.86 in the fiscal year 1893-1894, the production jumped to ₱9,366,139.25 in the year following, and a steady increase was recorded until 1898-1899, when the gold output reached ₱18,450,885.87. There was a decrease of ₱3,000,000 in production in the next fiscal year, but in 1900-1901 the total almost equalled that of 1898-1899; and since that time every year has shown an increase.

Zinc mining in Mexico has continued to suffer by reason of the high import duty imposed by the United States, but possibly not to the extent generally supposed. Due to the high prices prevailing, much high-grade zinc ore was shipped to American smelters during 1910. From the Monterey territory shipments to the United States have been three to four times heavier than the shipments to Europe, by way of Tampico. At the request of zinc miners, with a view to encouraging the exportation of zinc ore to Germany and England, the National Railways of Mexico reduced the rate on the zinc product to Tampico, and increased it to border points. The establishment of a zinc smelter in Mexico continues to be discussed, but so far nothing has been done. Concessions for zinc smelters were granted in 1909. Mexico's lead is principally the product of the important silver-lead mines of the northern portion of the Republic. In the fiscal year 1909-1910 the lead exports had a value of ₱6,808,465.

The feature of Mexico's oil development in 1910 has been the success attained in the Juan Casiano field in Veracruz, the property of the Huasteca Petroleum Co. of Los Angeles. This is a subsidiary of the Mexican Petroleum Co. of Delaware, which also controls the Mexican Petroleum Co. of California, operating at Ebano, State of San Luis Potosi. Two gushers and several flowing wells have been brought in, and an 8-in. pipe-line has been built from Juan Casiano to Tampico, 65 miles, at a cost of approximately $1,000,000. Late in the year a contract was made with the Waters Pierce Oil Co. for the delivery of 2,500,000 bbl. of oil to the Tampico refinery. In October the Huasteca company became a dividend payer, and as a result the payment of dividends on the common stock of the Mexican Petroleum of Delaware has been commenced. The company has distributed over $3,600,000 in dividends on its preferred stock. The year saw the completion of a pipe-line and railroad from the Furbero field of the Oilfields of Mexico Co., in the State of Veracruz, to the Gulf port of Tuxpan, and the delivery of Furbero oil by tank steamer to the Minatitlan refinery of the Pearson-Aguila interests on the Tehuantepec isthmus. The Pearsons have a contract for the present output of the Furbero field, and advanced over ₱2,000,000 for the construction of the pipe-line and railroad. Oil exploration has been in progress along the Gulf coast of Mexico during the last year. The West Coast of Mexico Oil Co., in which English capital is principally concerned, was recently organized to work along the west coast of the Republic. Arrangements have been made to start drilling on the Buenavista ranch in northern Sonora, a short distance southeast of Nogales. The Mexican Petroleum of California has continued to supply about 6000 bbl. of fuel-oil per day to the National Railways of Mexico. The oil war of the Waters Pierce and Pearson-Aguila interests has shown no abatement.

In the first nine months of 1910 the output of the Coahuila coalfields, at present the only fields producing coal in commercial quantities, amounted to 1,213,163 tons. In the same period the output of the four Coahuila companies producing coke totaled 165,653 tons. The production of coal and coke has continued at about the same rate during the last three months of the year. There are nine companies now marketing coal in Coahuila. There has been much development work during the year at the Barranca coalfields in the State of Sonora, the property of the Sunset Development Co., a Southern Pacific concern. The results have not been satisfactory, due to the broken character of the drifts. J. F. and C. R. Williams as lessees have been developing Los Bronces coalfields, in the same part of Sonora, and have been selling some coal to neighboring mining concerns. These fields are owned by Ramon Corral, vice-president of Mexico. The existence of commercial coal in the State of Oaxaca has been proved by the Oaxaca Coal & Iron Co..

The Monterey Iron & Steel Co., operating the steel plant at the Nuevo Leon capital, continues to be principally responsible for iron mining in Mexico. The Mexican Iron & Steel Co., a Boston concern that in 1909 contracted to buy the Tula iron mines, foundry, timber, and lands in the State of Jalisco for ₱1,000,000, has during the last year remodeled the foundry and purchased a traction train for the transportation of ore. The company's investments now amount to about ₱500,000, the greater part of this sum having been applied on the purchase price. A modern steel plant and tool and implement works are planned. The exploitation of Oaxaca iron deposits in connection with the coalfields of that State is proposed. English capitalists are considering the purchase of iron properties in the State of Colima.

Moves of importance to the custom smelting industry of Mexico were made in 1910 by the Pacific Smelting & Mining Co., of New York, which since its organization has owned the Fundicion copper smelter and other former holdings of the Douglas Copper Co. in the State of Sonora. Early

in the year a financial readjustment was effected, and since that time the lead smelter erected at Guaymas several years ago by the Mexican-American Smelting & Refining Co., a W. C. Greene enterprise, and the concession granted by the Sinaloa government for a custom smelter at Mazatlan, have been taken over. Contracts for copper and lead ores have been made, and it is expected to have the Fundicion and Guaymas plants in operation some time in 1911. Early in 1910 the American Smelters Securities Co. purchased the Matehuala smelter of the National Metallurgical Co., and the Guggenheim concern is now completing the installation of a new 500-ton furnace. The American Smelting & Refining Co. increased the capacity of its Chihuahua smelter from 450 to 750 tons per day. A contract made a few months ago by the Cananea Consolidated Copper Co. will bring the product of the big concentrator of the Miami Copper Co. of Arizona, into Mexico for smelting at Cananea. The custom smelters of Mexico are no longer respecting one another's 'territory,' their agreement along that line having been abandoned, and operators are benefiting from active competition. Silicious ores of shipping grade are in great demand.

NEVADA

By H. E. Davis

The metal production of the State of Nevada for 1910 was approximately $45,000,000; gold, silver, and copper predominating in the order named. Aside from these metals, there has been an output of lead, bismuth, antimony, zinc, graphite, tungsten, salt, borax, quicksilver, and sulphur. The metal production for 1908 was valued at $15,000,000; for 1909, despite the lack of public confidence and the difficulty of financing mining ventures, it reached $30,000,000. The estimate for 1910 is based upon the figures turned over to the State bullion tax officials. The geological and metallurgical developments in Tonopah, Goldfield, and Ely are most interesting. Contrary to predictions, the ore deposits of the Tonopah and Goldfield districts are proving to continue to great depth. The Belmont mine at Tonopah, for instance, at more than 1000-ft. depth is proving better than ever. During the year a mill has been constructed by the Tonopah Extension M. Co., in which it profited by the problems that had been worked out by the other companies operating in Tonopah district, and has a plant equipped for amalgamation, concentration, and cyanidation. High-grade ores are sent to smelter. In the Goldfield and other districts in southern Nevada the milling problem is more complex, due to the occurrence of both oxide and sulphide ores. The wide range of ores found in the same mine makes the task of the millman a busy one, for he must keep some sort of uniformity in the product that is sent to mill. The Consolidated plant of 100 stamps at Goldfield, with amalgamation, concentration, regrinding, and cyanidation, is making an average saving of 93% from ores that assay $30 to $40 per ton. The Florence, with a similar process, is saving 95% from $12 to $20 per ton ore. The Consolidated reduces its own concentrate by regrinding and cyaniding, while the Florence ships its concentrate to smelter. Mining at 1000-ft. depth in the mines of the Consolidated company is developing large bodies of milling ore, with some streaks of rich ore; and interest now attaches to the operations in properties lying east and south of the Consolidated group, where work is being done at 1200-ft. depth. Should these properties also prove to contain large bodies of good ore the future of the district will be assured. The Florence Goldfield company has heretofore done little work at a greater depth than 350 ft., and this has been in the way of cleaning up the ground above the level that had been opened by leasing companies. Now, however, this property is to be opened from 350 to 1000 ft. in depth, and its operations in virgin ground will be of interest geologically and may result in greatly increasing the output of Goldfield district.

The Nevada Consolidated company at Ely produced 65,000,000 lb. of copper the past year; and the Giroux company is making extensive preparations for mining in that district. A smelter is being constructed at Wabuska, principally for the reduction of the copper ore of Yerington district. Thus the industry of the eastern part of the State exemplifies the approved methods of handling porphyritic copper ore, while in the western part are being developed modern methods of mining and treating high-grade copper ores which occur in lodes that require mining, not quarrying. With a better understanding of Nevada geology and metallurgy a period of mill-construction and development of low-grade orebodies is beginning. All over the State, little 5 to 10-stamp mills are being erected, some of which are operating profitably, paving the way for the bigger mills that will replace them later. 'Make the mine pay its way' is the slogan of the Nevada operators of today, and some of the little mills that are being constructed represent the triumphs of the chemist's and engineer's skill. Mill building and development of low to medium-grade properties is notably under way in the Manhattan and Round Mountain districts, Nye county; in the El Dorado district, Clark county; in the Rawhide and Hornsilver districts, Esmeralda county; in the Yellow Pine zinc district, Clark county; at National, Humboldt county; at Austin, in Lander county. The Comstock mines are increasing their production of silver, and prospects are that man will yet triumph over the floods of hot water that have for so many years filled the deepest workings on the Comstock lode. Pioche is reviving and soon is to have milling facilities. A 100-ton mill has just been completed at Gold Mountain, Esmeralda county, which is to handle the ores of that district and the output of the two developed properties of Hornsilver, while a mill for Hornsilver camp itself will be constructed in the near future. A new mill is soon to be built on one of the Goldfield properties, and a 50-ton plant is being erected at Railroad Springs, 20 miles from Goldfield. Fifteen miles from Tonopah the Liberty company has a 100-ton mill at work, and in the Bullfrog district no less than seven small mills are either dropping stamps or are under construction. The promoter and stock salesman have given way to the engineer and the assayer, who are working together. Their work is being shown by the production and dividend record of Nevada.

PITTSBURG DISTRICT

By S. L. Goodale

The make of pig iron for furnaces in the Pittsburg district during the year 1910 is as follows, according to the monthly figures of the *Iron Age:*

January	603,261	July	502,711
February	541,791	August	510,352
March	592,494	September	505,342
April	543,531	October	507,508
May	510,514	November	445,083
June	483,909	December	424,000
Total, first half	3,275,500	Second half	2,894,996

Total, 6,170,496 tons.

The late months of 1909 and early months of 1910 witnessed the record production of pig iron; and it may be seen from the above figures that for the year as a whole Pittsburg has made a very creditable showing; that altogether it has been a good year. In this connection it is interesting to note the railroad and river tonnage for the district as supplied by the Chamber of Commerce; for the last four years:

	Railroad.	River.	Total.
1906	113,000,000	9,000,000	122,000,000
1907	146,798,351	14,395,816	161,194,167
1908	104,500,508	11,454,895	115,955,403
1909	145,580,388	12,426,154	158,006,542

And the figures for 1910 are estimated by the same authority to be in excess of those for 1909, although it will be some time before exact totals are available.

November and December production of pig iron show very sharply the result of blowing out a large number of stacks; and of the furnaces that are in blast much of the

product is being stocked, and most of the plants in the district have already fairly large stocks. Productive capacity in the iron and steel trade has grown so rapidly that just now it is considerably ahead of the rate of consumption. Nowhere near the average market demand of the year just passed could have been supplied by the furnaces existing and in blast only four or five years ago; and it does not seem either surprising or alarming to find that at a time like the present only perhaps 65% of the furnace capacity is in blast. From early fall of 1907 until the present time some 41 new blast-furnaces were built in this country, and some 10 more nearly or completely finished, while only 12 rather small furnaces were abandoned or dismantled, the result being a net increase in productive capacity of over 6,000,000 tons of pig per year. A few years ago 65% of the present business would have looked large.

While prices now are at a lower level than at the beginning of the year, especially in certain classes of product, as shown briefly below, still it cannot be said that the market is by any means demoralized. Orders on Panama Canal work, rail and other buying by the railroads, structural steel orders, etc., seem to be sufficient to keep the mills running a half of each week at least. It is estimated that builders offered the manufacturers about 1,750,000 tons of structural steel business during the year. In rail orders there is a tendency toward more exacting specifications, and considerable of the heavy tonnage offered by railroads has not been accepted on this account; although some of the mills are said to be rolling now on orders for the first quarter of 1911. The situation in all departments seems to be about the same as for the blast-furnaces; that is, it mostly is a question of how soon enough furnaces will be blown out to bring production down to consumption. The following figures, taken partly from the *Iron Age* are of interest in regard to prices:

	1907. High.	1909. Low.	1910. High.	1910. Dec.
Bessemer pig iron, valleys..	$23.28	$14.58	$19.10	$15.00
So. No. 2 foundry, Cincinnati.	$26.00	$14.25	$17.25	$14.25
Bessemer billets, Pittsburg..	$30.00	$22.00	$27.50	$23.00
Structural shapes, Pittsburg.	1.70c.	1.10c.	1.55c.	1.40c.
Steel bars, Pittsburg.....	1.60c.	1.05c.	1.50c.	1.40c.
Sheets, 28 gauge, Pittsburg..	2.55c.	2.10c.	2.40c.	2.20c.

An important new construction of the year has been the plant of Jones & Laughlin at Aliquippa, on which, however, considerable progress had been made prior to 1910. Four new blast-furnaces have been completed with accessories, and the building of four large Talbot open-hearth furnaces is nearly or quite completed. The plant is well arranged as to handling of material about the works and exhibits rather adherence to good standard metallurgical practice than the introduction of many novelties. The coal-hoist on the river is capable of handling 900 tons per hour, and space is provided for the erection of a large coking plant. Several departments of the mills are at work, including the wire and nail mills and the tin-plate department. "Woodlawn, the new industrial town which is being built by Jones & Laughlin for the men at Aliquippa, is pleasantly situated on the higher ground near the plant. Five hundred houses are being built of six to ten rooms each, and schools, churches, stores, and banks are also being built. One of the features of the new town will be the large club-house of two stories height, 100 by 162 ft., and equipped with all conveniences for recreation and amusement. It has been the company's aim to build a town that will not only be modern in every feature, but also attractive to the highest class of labor." In this connection, mention should also be made of Marianna, the model coal-mining town of the Pittsburgh Buffalo Co., where the endeavor of the company has been to provide their workmen with comfortable convenient modern homes at a moderate cost. A large number of these miners' houses have been built, and also a fine club-house containing a ball room, a theatre, bowling alleys, and billiard and pool rooms, and equipment for other amusements. At the shaft, change rooms are provided, equipped with shower baths and locker arrangements, and men leaving the mine step directly into this building without first being exposed to the weather. The trend of improvement in local coking practice is well shown at Marianna, where the waste gases from the beehive ovens are conducted to the boilers for the purpose of raising steam. It is said that one oven will develop about 14 to 16 hp. while burning. This is a great advance over the prevailing practice of totally wasting these gases, and is a long step in the right direction toward the use of by-product retort-ovens wherein practically the full value of the coal will be used in some way. On this same line of better provision for employees comes the announcement that the U. S. Steel & Carnegie pension fund of $12,000,000 will be made available on January 1, 1911. This fund is to be administered by twelve trustees through J. B. Erskine, manager, with headquarters in the Oliver building, Pittsburg. Three classes of pensions are provided: (1) pensions by compulsory retirement, granted to employees who have been 20 years or longer in the service and have reached the age of 70 years for men and 60 years for women; (2) pensions by retirement at request, granted to employees who have been 20 years or longer in the service and have reached the age of 60 years for men and 50 years for women; (3) pensions for permanent incapacity, granted to employees who have been 20 years or longer in the service and have become permanently totally incapacitated through no fault of their own. These monthly pensions are to be paid from the income of the fund, and range from $12 up to $100 per month. The H. C. Frick Coke Co. has also established a relief fund, available from May 1, 1910, and effective for one year, with the announcement that a similar plan may be put in force later. This relief plan is entirely voluntary, and no deductions from the men's pay will be made. Relief is to be paid for not to exceed 52 weeks to those injured or the families of those workmen killed in the service of the company. The minimum is 35% of the daily wage paid at the time of the accident to be paid to single men, and 50% for men married and living with their families, and this is increased by 2% for each year of service with the company over five, and also somewhat for larger family responsibilities.

Conditions in the coal and coke business are not altogether satisfactory, especially as to the price secured for the output. It is doubtful if any other great industry of the country is conducted on as small a margin as is the mining of coal. Aside from this feature, the year has been a good one, starting in even with prospects of a boom year. Early in the year some delay in transportation was caused by car shortage; this has not been true in the later months, as some of the railroads have been able to borrow motive power and cars to assist them in this respect. On January 10 last, the H. C. Frick Coke Co. posted notices at all their plants in the Connellsville district to the effect that wages were to be restored to the scale effective in 1907. Later in the spring, and after several weeks' agitation, the operators of the district and miners of the United Mine Workers of America signed a wage scale on April 29, effective for two years. Labor conditions in the district have, in general, been good. As there have been extensive labor disturbances in other bituminous fields, a good deal of tonnage has come to Pittsburg which ordinarily would have been supplied elsewhere. In the lake trade, especially, is this true. The lake tonnage from all districts for the ten years ending 1910 is as follows:

Year.	Pittsburg District.	Ohio District.	W. Va. District.	Total.
1901	3,795,706	1,954,825	787,572	6,538,103
1902	4,704,093	2,689,974	965,769	8,359,836
1903	6,092,047	2,458,265	1,539,435	10,089,747
1904	6,058,383	2,138,247	1,279,876	9,476,506
1905	7,443,883	2,062,692	2,109,262	11,615,837
1906	9,287,272	2,560,906	2,743,732	14,591,910
1907	10,549,995	4,074,296	3,420,941	18,037,232
1908	8,700,000	3,600,000	3,450,000	15,750,000
1909	8,687,305	3,002,815	3,874,570	15,564,690
1910	11,911,900	4,297,300	6,629,500	22,838,700

These figures are supplied by courtesy of John H. Jones, who may be quoted further: "The production in the Pittsburg district this year will be about 50,000,000 tons, and 1911 should surpass this. General mining conditions are very favorable for a good production in 1911, inasmuch as the miners' scale has been settled and does not terminate until April 1, 1912. * * * The wonderful prosperity in the Northwest, brought about by good crops, and its great industrial activity, should even cause an increase in 1911 over this year." A great deal of attention has been given by the operators this year to the matter of providing every known safeguard for the health and safety of their employees. The authority just quoted says: "The Government testing station here has done great good, and I believe that with the progress that has been made, the United States will continue to lead the countries of the world in a low mortality rate per million tons of coal mined." The following figures show that we now head the list (with great room for improvement): United States, 3.84 lives lost per million tons of coal produced; Great Britain, 4.15; Germany, 6.35; France, 6.56; Belgium, 5.71; Austria, 8.16. The Pittsburgh Coal Co. mined in the Pittsburg district, for the first three months of 1910, 3,485,055 tons, as against a production of 2,130,389 tons for the corresponding period of 1909; and produced 146,867 tons of coke in the later as against 96,046 tons in the earlier period. For the first nine months of the year the same company mined coal and produced coke as follows:

	1909.	1910.
Coal mined in Pittsburg dist., 9 mo..	9,718,334	11,470,112
Coke burned, 9 mo.	344,079	459,930

This shows that the large figures of the earlier part of the year have been maintained through the summer months. The production of coke in the Connelsville district may be stated as follows, giving figures for 1908 and 1909 for comparison, and estimating the total for the last three months of 1910 from weekly reports available: production 1908, 10,700,000 tons; production 1909, 17,800,000; production 1910, first six months, 11,238,425, second six months, 8,968,000.

The average price quotation for 1909 has been given as $1.05, based on run of mine, with an increase to $1.15 during the last three months of the year. For 1910 the figures show about $1.25. Quotations on coke show:

	Furnace.	Foundry.
First nine months.....	$2.00 to $2.35	$2.25 to $2.50
Last three months.....	1.75 to 1.85	2.20 to 2.45

The production of the Pittsburg district is estimated by another large operator to be about 85,500,000 tons for 1910, including, however, a larger territory in the term than Mr. Jones, namely, the first, second, fifth, seventh, ninth, eleventh, thirteenth, fourteenth, sixteenth, seventeenth, nineteenth, and twenty-first bituminous districts of the State. The year has been a rather uneventful one, with no new capacity added in the district, and no considerable change from 1909.

In the field of technical and engineering education the year at Pittsburg has several interesting features, including the gift of Andrew Carnegie of $3,500,000 for the Carnegie Technical Schools, of which $1,500,000 is to go for endowment and $2,000,000 for additional building construction and equipment. Not only is the present attendance of students as large as the schools can provide for with their present equipment and funds, but a great many more have applied for admission than can be received, so that this last gift will permit the advantages of the schools to be extended to a greater number seeking admittance. At the University of Pittsburg, it is announced that four fellowships have been provided in the new department of industrial chemistry. This is a continuation of very important research work begun by Robert K. Duncan at the University of Kansas and now to be continued here, connecting the chemical department of the University directly to the practical needs of the manufacturers of the district. A thoroughly trained man is employed exclusively on one problem, having the laboratories and equipment of the University at his command, but the salary being paid by the manufacturer, who is to have for a definite period the exclusive right to any new processes developed, the University at the end of the period to have the right to publish full accounts of the work. In the School of Engineering of the University, the co-operative plan of technical education has been adopted, whereby each student is to have each year three-quarters at the University and one-quarter at some shop or mill, still under the direction of the University, thus combining very closely the advantages of practical and theoretical education in a well planned course. The School of Mines of the University is unique in offering, besides the usual courses for the mining degrees, including the co-operative feature of the engineering school when desired, every facility and almost unlimited opportunity for the practical man, whatever his age and training, to attend the school pursuing such courses as he may profit from to broaden his grasp on his own subject.

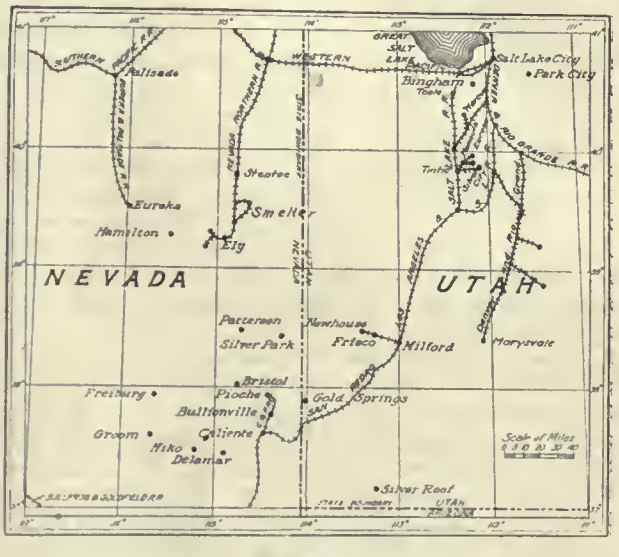
UTAH

The metal-mining industry in Utah for 1910 has been characterized by an increase in the production of copper, and a nearly normal output of lead, silver, gold, and zinc. The principal increase in copper was due to the gigantic operations at Bingham and to doubling of milling facilities for concentrating the low-grade copper ores which occur in porphyry and quartzite of that district. Within the year there was accomplished the absorption of the properties of the Boston Consolidated by the Utah Copper Co., the increase of this company's Magna mill to a capacity of 13,000 tons per day, and the remodeling of what was formerly the Boston Con. mill, and raising its capacity to 7000 tons per day, giving the Utah Copper Co. facilities for concentrating 20,000 tons of ore per day. In the meantime, this company has built a railroad of its own from the mines in Bingham canyon to its mills, and to the San Pedro line at Garfield. The Ohio Copper Co., whose mine is mostly in quartzite, lying on the east side of Bingham canyon, completed and put in operation two units of its concentrator last spring, and has recently finished its third and fourth units, giving the plant a capacity of 2500 tons of ore per day. Besides, there is a separate plant for classifying and concentrating the slime from the principal mill. The Ohio workings are among the deepest in Bingham district, the 14,000-ft. adit, that starts from the millsite at Lark, tapping the orebodies at a depth of 1400 ft. on the incline. The Yampa smelter, having McDougall roasters, and reverberatory and blast-furnaces, has operated mostly on copper ore from the Yampa mine, but has taken some custom ore. The Utah Consolidated Co. has carried on extensive development from levels below the main haulage adit No. 7, where a big tonnage of ore was made accessible; but concerning reserves in the entire mine there have recently been wide differences in the estimates made by examining engineers. An aerial tramway was built during the last year, from the mine to the International smelter near Tooele, a distance of 3½ miles. The Utah Apex mine, in the same district, is well-developed, has over 100,000 tons of lead-silver ore available, and has a mill which is being remodeled. The United States S. R. & M. Co. has mined and shipped ore on a considerable scale at the Old Jordan and Galena mines in upper Bingham, while its other mine, the Old Telegraph, has been operated successfully by the Utah Leasing Co., all three being principally lead producers. The Bingham Mines Co. has mined and shipped 600 to 700 tons per month of copper, lead, and silver ore from the three veins of the Dalton & Lark group, access to which is gained through a level driven from the Mascot tunnel that leads into Ohio ground. The same company is also operating the Commercial mine, lying southwest of the Ohio group, from which ore shipments at last accounts amounted to 100 tons per day. The North Utah M. Co., owner of the Butler-Liberal and other partly-developed mines on Markham gulch, has done considerable exploring, has mined and shipped some lead ore, and recently remodeled the Red-

wing mill. The Bingham & New Haven, situated on Carr fork, above the Highland Boy, has been well opened by adits which intersect several orebodies, and during the year has mined copper, silver, and gold ore of both milling and shipping grades.

Some of the best examples of successful mining in Utah are to be seen in the Tintic district, where there are about 20 shipping properties whose output has been running close to 125 cars of ore per week. The United States S. R. & M. Co., which owns the Centennial-Eureka and Bullion-Beck, at Eureka, mines copper, silver, lead, and gold ores, shipments amounting to 50 to 60 cars per week. During the year this company's new work consisted of establishing an electric-pump station at 2200-ft. depth in the Centennial-Eureka shaft; the driving of a 2200-ft. tunnel from the level of the railroad track to the 600-ft. level of the same shaft, to serve as a haulage-way and as drainage for water discharged by the pumps; also, the building of a steam-electric power-plant close to the portal of this tunnel, the machinery for which was housed in a steel structure. The Chief Consolidated, one of the newer mines of the district, belongs to Michigan operators, and within the year its shaft has been sunk from 1000 to 1800 ft., and extensive development has been done, resulting in opening profitable bodies of silver and gold ore on the 1400, 1500, 1600, and 1700-ft. levels. It is now a dividend-paying mine. The Eagle & Bluebell M. Co., whose mine adjoins the Chief, has sunk its 200-ft. shaft 800 ft. deeper, connecting the 1000-ft. station with the old workings, which formerly were entered through an adit and incline. The new shaft is well timbered and so equipped that all ore is hoisted through it. This property is a regular ore shipper. On the opposite side of a mountain spur are situated the Grand Central, Mammoth, and Lower Mammoth, all deep mines and productive. The Grand Central has been producing several cars of ore per week, running well in copper, silver, lead, and gold. The ore mined is taken from all levels from the 600 to the 2100, inclusive. Some shipments have run as high as 4% copper, 10% lead, and 30 oz. silver. The Mammoth is opened to a depth of 2200 to 2300 ft., and while not a heavy shipper, is noted for the high grade of its ore, which contains silver, gold, copper, and lead. The Lower Mammoth, having an extension of the original Mammoth ore-zone, is developed from a 2000-ft. shaft; the principal vein, as shown by the open stopes on the 1700 and 1800-ft. levels, is 15 to 20 ft. wide and yields silver-lead and copper ore. A considerable tonnage of ore has been shipped during the year. The property is equipped with a double-drum electric hoist by which cages are run in two compartments of the shaft. The Opex and Emerald are being developed and explored at a depth of over 2000 ft. The Gemini, one of the oldest mines of Tintic district, has installed electric pumps at the 1600-ft. station, the water-level being at 1700 ft., and the plan is to unwater the mine to the 1900-ft. level. Oxidized silver-lead ore was found to extend to a depth of 1600 ft., below which it is mostly sulphide. The opening of the sulphide bodies was accomplished during the year. The Gemini is a steady ore shipper. The Uncle Sam and May Day, at the north end of the district, both under the same management, have produced steadily, the former shipping ore that sampled about $30 per ton; the latter has the only active mill in the district, by which most of its ore has been concentrated. The Yankee Con. Co., operating in the same neighborhood, has been directing its energies to development. The property is well equipped and has extensive workings. Some shipments of silver-lead ore of good grade have been made each month. The Colorado, Iron Blossom, and Beck Tunnel, all under one control, are on the east side of the range, have yielded a big tonnage of ore during the year, and paid $400,000 in dividends. The Iron Blossom has produced heavily from its 400 and 500-ft. levels, and recently ore has been found on the 800-ft. level, the ore running high in lead-carbonate and chloride of silver. Other producers of the district include the Dragon, Sioux Con., Ridge & Valley, Iron King, Gold Chain, Opohongo, and Scranton, with the Tintic Standard and others undergoing deep development. Practically all the deep mines of the district are in limestone, in which water-level has been found at depths ranging from 1700 to 2200 ft. below the surface. There is some development in the adjacent porphyry areas where a strong flow of water is found at 300 ft., notably in the mines south of Silver City.

Park City district, which holds a high place in the mining history of the State, has had a large amount of development the past year, though the production of lead, silver, and other metals has hardly been up to the normal. The reduced output of the Silver King Coalition Mines Co. for the year was due principally to litigation in which it was involved, and to the fact that the 400 men employed have been engaged mostly on development and in making changes in surface and underground equipment. These consisted in providing for electric haulage on the surface and in the main levels, putting in ventilating pipes and installing a Worthington centrifugal pump, direct-connected to an electric motor, by which part of the volume of water flowing from the Alliance adit is delivered to the concentrating mill; and in arranging for electric power in the machine shop. All workings, including those first tributary to the Alliance adit, are now connected with the main Silver King shaft, through which ore from all parts of the mine is hoisted. The mine is undoubtedly in condition to increase its production of ore greatly in 1911. The Daly West's output of milling ore has been kept up to 300 to 350 tons per day, from which has been obtained one class of concentrate running 40 to 45% lead, 35 to 38 oz. silver per ton, and another class containing 40% zinc, 4 to 5% lead, and 15 oz. silver. The shipment of crude ore of a smelting grade has been lighter than formerly. Ore has been mined on the 800, 900, 1500, and 1700-ft. levels, the most extensive stoping having been between the 1600 and 1700. The 1800-ft. level has been established through a winze sunk from the 1700; and a 1900-ft. level is being opened by cross-cutting 1400 ft. from the shaft, which is probably accomplished before now. The depth of the shaft is 2100 ft., from the bottom of which a connection is made with the Ontario drainage tunnel. A haulage-level extends from the 1200-ft. station out to the surface at Park City. Within the last six months a system of leasing has been in vogue here. The Daly-Judge mine produces a milling ore which assays 4 to 9 oz. silver, 6 to 9% lead, 6 to 12 zinc, and 10 iron, which is concentrated in the ratio of 3 to 1, resulting in making a lead-silver concentrate which is shipped to the smelters, and a zinc-iron product. The first-grade ore runs approximately 25% lead, 33 oz. silver, and 4% copper. The output of the mine has been close to 175 tons per day. Prior to the year 1910 the mine production had for some time been confined to levels at and above the 6600-ft. adit-level, which connects with the 1650-ft. shaft at the 1200-ft. station. But during the past 12 months the Daly-Judge M. Co. has gained access to the 1500 and 1600-ft. levels which



Nevada-Utah.

had been submerged for a number of years. This was accomplished by pumping water up to the 1200-ft. level where it was discharged and drained out of the mine through the adit; this work was lately supplemented by a connection which was made with the Daly West and Ontario drainage system. Stockholders of this company are identified with the Snake Creek Mining & Tunnel Co., which is driving a 14,000-ft. adit from the opposite side of the range into Daly-Judge ground; this will enter the ore-zone 200 ft. lower than the 1600-ft. level. About 2500 ft. of this adit has been driven. The Ontario is in the hands of lessees, mainly, who are mining and marketing about 50 tons of ore per day.. The Little Bell has become a producer and dividend-payer within the last six months, the greater part of its ore being concentrated in its new mill.

Mining operations in Beaver county have been advanced materially during the year. The Red Warrior and Burning Moscow mines, in the Star district, have been well developed, are shippers of lead and silver ore, including some copper. They are adjoining mines, under different ownerships, and have been developed to a depth of 500 to 600 ft. The Utah M. M. & T. Co. has developed large bodies of iron, lead, and silver ore in a vertical vein and of cuprite in bedded veins, shipments of both kinds having been made. Other development in the Star district has proved important. The South Utah Mines & Smelters resumed operations at the Cactus mine and mill at Newhouse, in September, and has since then been mining and concentrating 600 to 900 tons per day of chalcopyrite-bearing ore; the concentrate, assaying about 13% Cu, 30% Fe, and high in silica, is shipped to the International smelter. The Majestic Copper Co. has been active during the year in developing the Harrington-Hickory group near Milford, resulting in exposing a big tonnage of silver-lead and copper ore, the workings extending now to a depth of 600 ft. The Utah United Mines Co. has made good progress in development. The Horn Silver mine, which has been a producer for over 35 years, is to be provided with a new concentrating mill in which to treat its zinc-lead-silver ore, of which there are large reserves.

An important achievement during the year was the building of the plant of the International Smelting & Refining Co., at the mouth of Pine canyon, near Tooele. Operations began in August, and by November there were five reverberatory furnaces in use, smelting copper ore and concentrate, first calcined in the McDougall roasters by which the sulphur is reduced to 6%. The matte turned out by the reverberatories runs 20 to 30% Cu, the slag close to 40% SiO_2, 48 FeO, and 4 CaO. The Garfield plant of the A. S. & R. Co. has both lead and copper furnaces in operation; included among the latter are six reverberatories. This plant and that of the International are the only two in the State at which copper smelting is in progress. At the plant of the A. S. & R. Co. at Murray, and that of the United States S. R. & M. Co. at Midvale, the lead furnaces only are being operated. The smelting plant built by the Knight people in Tintic district, which was equipped for both copper and lead smelting, was not operated during the year. The United States company has operated a milling plant at Midvale during the year, in which 250 tons per day of zinc-lead-iron ore has been treated in a manner that attracted much interest. First, a lead-concentrate is made on jigs and tables by the usual methods of wet concentration; this concentrate amounts to 65% of the product of the mill. A zinc-iron concentrate and the zinc middling, produced also by wet concentration, are passed through driers to eliminate the moisture. They contain 21 to 24% iron, 4 lead, 20 to 23 zinc, 5 silica, 2 lime, and about 30 sulphur. The material is then sized by impact screens for electrostatic machines; the coarsest of the grades thus made, running 32% iron and only 7 zinc, is sent to the smelter. The finer grades are passed through five units of the Huff electrostatic plant, by which the zinc and iron are separated, giving one product running 52% zinc, 4 iron; and another of iron containing about 9% zinc. The ores treated at this plant are shipped from this company's mines in Bingham canyon.

WYOMING

By H. C. Beeler

Mining in Wyoming was quiet during the year of 1910. In the Sunlight district, northwest of Cody, Wyoming, continuous development has been carried on with gratifying results. The Winona Gold-Copper Mining Co. has recently built a complete steam and electric plant. The adit has now reached a length of 750 ft. and has cut four veins, that at about 600 ft. being the first of the series of fissures to develop which this tunnel was projected. The ore is from six to ten feet wide and of smelting grade. This company has also acquired adjoining ground to cover a huge low-grade copper deposit which is exposed by glacial erosion for a length of about 2000, a width of 1000, and a depth of 250 ft. This exposure has been systematically sampled during the past season and shows a remarkable average gold and copper content, with a number of veins of richer mineral. The Winona company is considering the establishment of a smelting plant, and possibly the building of a railroad through the Clark's Fork Canyon country during the coming season. Purchase by the Copper Belt Mining Co. near Hartville of the Michigan mine is reported and a matte smelter projected at a point midway between the properties. In the central part of the State activity has been greatest in the asbestos fields near Casper in Natrona county. The International Asbestos Mills & Power Co. of Denver, which entered the field about a year ago, has been most active and its efforts have resulted in placing the Wyoming asbestos fields in the shipping class. The internatioual company has taken a bond and lease on the mill and property of the Wyoming Consolidated Asbestos Co. and has completed a mill equipment to handle the rock from the quarries to the mill. Within the season seven cars of fiber were shipped. A great deal of the preliminary work of the mill has been confined to the adjustment of the machinery to the new conditions of rock and fiber of this field and to grading the products according to the standards already established in the asbestos trade. The international company has also leased the grinding plant of the Colorado Iron Works of Denver and is now supplying the trade with a low-grade asbestos plaster and cement material from this plant. A series of experiments on this material were conducted in person by the officers of the company and has met with unexpected success. This company will be in position within a short time to supply the local and Western trade with this material, as well as higher grades of fiber and crude asbestos. The management reports that trade has opened up in a most gratifying manner. The first dividend will be paid January 16. The Northwestern Asbestos Co. of Denver has leased the holdings of the North American Asbestos Co. on Casper mountain and is now engaged in completing its fiberizing mill, which should be in operation about the first of February. A tramway is projected from the quarries and mill to the foot of Casper mountain to handle fiber and rock and facilitate shipments during the winter season. This product is shipped to the International company at Denver, as this company has the preferred right to purchase the product of the North American mill and is aiding the enterprise in every way possible. The Casper vicinity is also attracting a great deal of attention because of being the headquarters of the various companies now in operation and negotiating for territory in the Salt Creek oilfields some fifty miles north of Casper. Drilling has been active in this field by a number of companies, a pipe-line to Casper is projected, and every effort is being made by those in charge of these enterprises to increase the production of the field and open up new territory. Recently the oil men of Wyoming met at Cheyenne, Wyoming, in convention in answer to a call from the Governor and formed the Wyoming Oil Men's Association, the object being to open up the oilfields and to advertise the oil resources of the State. Representatives from nearly all the oilfields were present and formed a permanent organization with B. B. Brooks, the Governor, as president. The coal production for 1910 is estimated at this time to be about equal to that of the previous year.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

C. H. MUNRO has gone to London.

R. H. RAINSFORD was in San Francisco.

ALBERT BURCH has returned from Alaska.

WILLIAM FORSTNER has gone to Bakersfield.

COURTENAY DE KALB has been at Tucson, Arizona.

W. S. WADE, of Salt Lake, is at the Palace, San Francisco.

E. CLAPP is at the Santa Gertrudis mine, Pachuca, Mexico.

BERTRAM HUNT has returned to San Francisco from Mercur, Utah.

WILLIAM F. BOERICKE, of Mineral Point, Wisconsin, has been in San Francisco.

LLEWELLYN E. HUMPHREYS, of Salt Lake, was in San Francisco, returning from Arizona.

JOSEPH H. PLAYTER, of Golconda, Nevada, is in Sinaloa, Mexico, on examination work until March.

ALGERNON DEL MAR, manager for the Fort Bidwell Gold Mining Co., has closed the mine for the winter and is at his home in South Pasadena, California.

H. N. TAYLOR is the new president of the Illinois Coal Operators' Association, with W. L. SCHMICK, vice-president, F. C. HONNOLD, secretary-treasurer, and C. L. SCROGGS, commissioner.

CURRENT PRICES FOR CHEMICALS

(Corrected monthly by Braun-Knecht-Heimann Co.)

Prices quoted are for ordinary quantities in packages as specified. For round lots lower prices may be expected, while in smaller quantities advanced prices are ordinarily charged. Prices named are subject to fluctuation. Other conditions govern Mexican and foreign business.

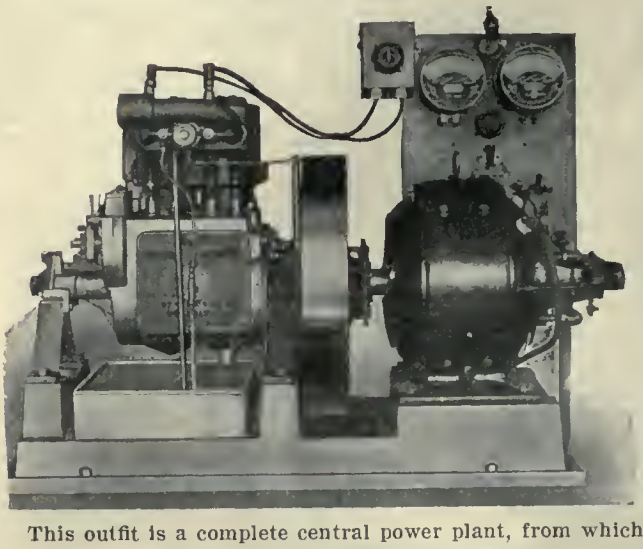
THE BRUSH ELECTRIC GENERATING SET

Many of our readers are familiar with the difficulties encountered in making a steady electric light with the ordinary type of gas engine. The makers of the Brush balanced, two-cylinder, vertical engine claim to have overcome all trouble, and to furnish an electric generating plant in which the current developed is as steady as that obtained by any of the better types of steam-engines, the variation on voltmeter showing less than 2% from no load to full load, and on constant load practically nothing.



This outfit is a complete central power plant, from which light and power may be conveniently transmitted to distant points. In the mining field, especially for prospecting and light development, its small weight, together with its compactness and portability, will appeal to many. The fuel used may be gasoline, kerosene, or distillate. The catalogue of the Brush electric generating set consists of about 100 pages of interesting reading matter and illustrations. The Chas. A. Strelinger Co., Detroit, Michigan, offers to send this catalogue free to anyone desiring it.

CORNISH DRILLS IN AMERICA

Holman Bros. of New York, a newly formed American corporation, are introducing the Holman rock-drill in the United States for the first time. They have issued a well compiled and handsomely illustrated catalogue descriptive of the drill, its special features, and the claims made for it. The firm manufacturing this drill, Holman Bros. of Camborne, Cornwall, England, was established in 1839, and has turned out over 30,000 rock-drills from its works. The size of the manufacturing plant, its equipment, number of hands employed, and yearly output rank the firm among the largest in the line. The Holman drill deserves more than passing attention. It was only recently awarded a $12,000 prize from the Transvaal Government and Chamber of Mines in the stope-drill contest in competition with over 18 American, German, and British competitors. This contest extended over a period of practically a year and cost $84,000. Known as an 'all-steel' drill, a few of the special features of the Holman machine are the self-tightening chuck for unshanked steels, crucible-steel ball-valves, and bushed front head without bolts. The valve motion is unique, being a combination of the independent valve and tappet. It seems like carrying coal to Newcastle for a Cornish drill manufacturer to enter the American field, and requires courage to face such a heavy handicap as the present duty of 45% imposes. It certainly bespeaks confidence on the part of the manufacturer in the excellence of his machine.

CATALOGUES RECEIVED

The Denver Fire Clay Co., Denver and Salt Lake City. Bulletin No. 40, 'Case Gasoline Furnaces.' Illustrated. 12 pages. 4½ by 7 inches.

The Wm. Powell Co., Cincinnati, Ohio. 'Especialidades para la Ingeniería.' A catàlogue in Spanish of engineering specialties. Illustrated. 56 pages. 5¼ by 7¾ inches.

Eugene Dietzgen Co., 18 First St., San Francisco. General Catalogue. Ninth Edition. A complete and attractive catalogue of drawing materials and surveying instruments. Illustrated in colors. 555 pages. 5½ by 8½ inches.

Dodge Mfg. Co., Mishawaka, Indiana. Booklet called 'Five and One-Half Miles per Minute.' Gives details of a test wherein a wood-rim pulley was run at a rim speed of 29,200 ft. per minute. Illustrated. 16 pages. 3½ by 6¼ inches.

The Marion Steam Shovel Co., Marion, Ohio. Catalogue No. 50. 'Marion Steam Shovels.' A wonderfully interesting catalogue of steam shovels. Complete details of the various models are given as well as numerous reproductions of photographs showing Marion shovels at work. Bound in limp morocco with gilt edges. Handsomely illustrated and decorated. 141 pages. 9 by 6 inches.

The American Well Works, Aurora, Illinois. Catalogue No. 117, 'Centrifugal Pumps.' An unusually attractive book, showing in detail more than 50 styles of centrifugal pumps, both volute and turbine. Twenty pages of useful information in the form of tables and diagrams make it valuable as a book of reference. Illustrated. 128 pages. 8 by 11 inches.

COMMERCIAL PARAGRAPHS

The Ajax Gold Mining Co., at Cripple Creek, Colorado, has contracted with The Moore Filter Co. for use of the Clancy cyanide process.

The Sullivan Machinery Co., has moved its San Francisco office to 308-309 Sheldon building, 461 Market street. H. T. Walsh is local manager.

A large contract for pumping machinery has been awarded to the Alberger Pump Co., New York City, by the Bureau of Yards and Docks, the total sum involved being slightly over $323,000. The contract covers pumping equipment for the three new dry docks to be constructed by the Government at New York, Puget Sound, and Pearl Harbor Navy Yards, and includes all told eleven 54-in. vertical volute pumps, each direct-connected to a 550-hp. induction motor, and seven 15-in. vertical volute drainage pumps, each direct connected to an 85-hp. induction motor; also all necessary suction and discharge piping, electrically operated gate valves for the same and all electrical controlling apparatus for the motors. Three of the 54-in. units will be located at New York, while four are required for each of the other docks.

DIVIDENDS OF UTAH MINES, 1910

The following is a list of the dividend-paying mines of Utah, together with the amount paid by each one during 1910.

Bingham-New Haven	$45,000
Boston Sunshine	6,008
Cliff	30,000
Colorado	300,000
Daly West	162,000
Dntchman	4,010
Grand Central	60,000
Iron Blossom	200,000
Little Bell	45,000
Lower Mammoth Ex	2,000

EDITORIAL

CHICAGO, and the Illinois Coal Operators' Association want to entertain the American Mining Congress next fall, according to report. It would be an excellent thing for the Congress to meet in Chicago and to secure the co-operation of coal men and of the mining men of the Lake Superior region. The Congress has held but two meetings in the East, at Joplin and Pittsburg, and to realize fully its ambition to become the general organization of mining men, it needs to cultivate the districts east of the Rocky Mountains. At the same time, there would be benefits accruing to the Eastern men from closer acquaintance with the work of the Congress.

OPPORTUNITY presented itself the past week to read a report on a mine situated in California, in which the statements made indicate an available block of ore containing 40,000 tons proved by mill runs to be worth from $9 to $20 per ton. Strange to say the mine is idle, and has been for some time, although operated at various times during the past forty years. It has been developed to a depth of over 600 feet and is in a district containing many good mines. In fact, the report calls attention to this circumstance, and mentions the mines. Needless to say, the object of this report is to interest capital for its further equipment and incidentally to supply the owner with some ready cash, but the strange thing is that the writer of such a report apparently expects anyone to believe that the statements made by him would be verified upon examination.

IN this issue we publish the third and last of a series of interesting articles on the Clifton-Morenci district of Arizona, by W. L. Tovote. These articles form a valuable contribution to the knowledge of mining and metallurgical methods of the Southwest. They also show to what refinement concentration is necessarily and successfully carried in the treatment of the low-grade ores. Still, notwithstanding all the care exercised, a certain percentage of the copper sulphide continues to escape, in this district six-tenths to seven-tenths per cent. The same may be said of the efforts to concentrate the sulphides in all of the copper districts of the West—Bingham, Ely, Butte, and Bisbee, including the large operations at Cananea and Nacozari, Mexico. This loss is equal to about $1.75 per ton of ore, at present copper prices. Closer saving than this, while perhaps mechanically possible, is not thus far commercially feasible. Here is a metallurgical problem which, if it can be solved so as to afford additional profit, should be worth a great deal to the engineer who can successfully accomplish it. Even the small ad-

dition of half a dollar per ton of ore would mean millions of dollars annually to the great copper producers of the country.

THE operation of paternal laws, as they affect mining in Burma are well described in a readable contribution by Mr. C. D. Clark, to be found elsewhere herein. Paternal laws, in some of their phases, particularly those intended to stimulate and aid the prospector, as in Australia, are to be commended, even though they are unknown in the United States, but laws which in their operation place a handicap on the prospector would quickly result in killing all ambition on the part of the pioneers of the mountains and the desert to discover a new mineral district. Notwithstanding there has been much fault found with the mining laws of the United States, yet they have been proved to be liberal, practical, effective, and beneficent. Under them has been developed the vast mineral wealth of the West. Men who were poor in everything but energy and courage have gone into the wilderness, found mineral, and made millions. Thousands have profited, directly or indirectly from these discoveries and their subsequent development. Great cities have grown up, in fact, the unprecedented development of the Western United States is due directly to the work of those Western pioneers of civilization, the prospectors. Who will say that similar results could by any possibility have been accomplished under Burma's system of mining laws?

PROGRESS demands sacrifice, but seldom has the world seen men so willingly risk and lose their lives to the benefit of knowledge as may now be observed at the aviation fields. It is true these men are not taking these fearful risks in their desire to advance the world's scientific knowledge, though incidentally each disaster adds somewhat to the common fund of data. Within the past few days some astonishing flights have been made. Two of the most noted and daring of the airmen were killed on December 31, both by falls from relatively moderate heights. Archibald Hoxey, who had won the world's record for elevation and had driven his biplane to a height of over 11,000 feet above the sea only a few days previous, was killed at Pasadena, California, by a fall of 225 feet. John B. Moisant, famous for his flight from Paris to London, fell to his death from his machine at a height of only 50 feet, near New Orleans. Notwithstanding these evidences of the risk involved, other aviators undauntedly mounted into the air in their frail aeroplanes on the day following. Undoubtedly many more lives must be sacrificed before all the weak points in the construction and manipulation of aeroplanes are learned. Aviation can never hope to become even relatively safe, either as a sport or as a business enterprise, but the airship has come to stay. Experiments in aerial navigation have been carried on for many years, but knowledge increases according to a geometric rather than an arithmetic ratio, and the greatest advance has been the result of the work of 1910.

The Calumet & Hecla Consolidation

It is only forty-five years ago since the outcrop of the Calumet mine was discovered in the woods on Keweenaw Point, in Michigan. The first five years of its development were comparatively slow, and although the work done at that time was sufficiently reassuring, it gave little presage of the phenomenal development of the future. Nothing indicates this more clearly than the modest capitalization of the incorporated Calumet & Hecla Mining Company, organized in 1871, with a capital of only two and a half million dollars. Since then the great property has paid dividends exceeding one hundred and thirteen million dollars; an amount greater than that paid by any other mining company in the world. But even the 'great and inexhaustible' Calumet & Hecla has, in recent years, shown unmistakable signs of approaching exhaustion, and in order to perpetuate the great industry, to reduce cost of production, and to employ a thoroughly organized staff to the best possible advantage, Calumet & Hecla has absorbed, wholly or in part, a number of its neighbors, including Osceola, Tamarack, Ahmeek, Superior, Isle Royale, Centennial, Allouez, La Salle, Seneca, Laurium, and Gratiot. This called for a large cash investment by the Calumet & Hecla company, but in view of the purpose of the great merger, there are few, if any, who doubt the wisdom of the consolidation at this time.

Re-Location v. Resumption

In our issue of December 24, last, appeared a reference to the laws regarding the performance of annual labor on unpatented mining claims, and relocation of claims on which the labor had not been performed nor improvements made, to the extent of one hundred dollars, as required by the Federal law. In that editorial the following statement was made: "As to assessment work, all unpatented claims upon which the annual labor has not been performed in the year 1910, except such as have been located within that year, are open to re-location at midnight, December 31, 1910, to anyone except the original locator. The latter may go upon the ground at the last minute, so to speak, and by the resumption of work, and continuing it until the one hundred dollars worth has been actually completed, save his claim from being appropriated or 'jumped' by others. This point in law has been passed upon by the courts of several States, and by the Supreme Court of the United States."

This statement appears to have given rise to some doubt in the minds of certain miners who have written to enquire if it is a fact that the original locator is not permitted to re-locate his own claim, and one of our correspondents asks for legal decisions sustaining this statement. As far as we are aware the matter of the right of an original locator to re-locate his own claim has never been passed upon as a separate question; the decisions relate to the right of the original locator, by resuming work before the intervention of another, to continue his legal title

to the claim. However, he must complete the hundred dollars worth of work or improvements, for if he discontinue work before it has been finished, the claim is still subject to re-location by another. There is a long line of decisions on which this statement is based, one of which is that of Honaker *v.* Martin, 27 Pacific, 397.

The theory of the law is that the title to a mining location rests in the locator, whether he perform the annual labor or not, so long as no third party intervenes and re-locates the claim because of such failure of the original locator to perform the work required by the law. Up to that time it is a matter entirely between the original locator and the Government, which will not question his right of possession, but the moment another re-locates the claim for failure of the former locator to perform the work, title passes to the new locator.

The law is very simple. It merely requires the performance of one hundred dollars worth of work annually on all unpatented claims. If the original locator fails to perform this work, his title holds good until some one else, because of such failure, deprives him of it by re-location. To allow the original locator to hold his claim year after year by simply re-locating the ground is absurd, as such course would completely defeat the purpose and intent of the law. The original locator having failed to comply with the law's requirements has forfeited his right and the claim is then open to location by any person willing to comply with the law, except the original locator. He may resume work and thus save and continue his title to the claim, but he cannot perpetuate that title by simply re-locating the ground—he must do the work required by the law. The California legislature in 1909 passed a law forbidding the re-location of a claim by an owner who has failed to perform his annual labor within three years after the date of location.

Mining and the Government

National legislation inevitably touches mining at many points, and the attitude of Congress and the Executive Departments is far from being a matter of academic interest to Western mining men. It is fair to say that Washington officials are usually friendly but occasionally uninformed. In 1910 there were numerous clashes. The laws and regulations governing mineral lands are being revised little by little to bring them into closer conformity with modern conditions and the principles of conservation. Any such change involves incidental hardship, however necessary and well-considered each step may be. In California the principal friction arises in regard to petroleum-bearing lands. The matter has already been reviewed at length, and it is sufficient at this time to say that an *impasse* seems to have been reached as regards future disposition of the lands. Eastern sentiment, with which in this case the President is in accord, favors introducing some form of leasing. Western sentiment, at least so far as it is active and effective, is opposed. It is not likely that any change will be made this year, and the lands will probably remain withdrawn from entry. Whether relief will be afforded operators caught in the process of change, is not certain, though remedial legislation is probable, since it would be but carrying out the intention of Congress when the present withdrawal act was passed. The principal legislation enacted within 1910 and important to miners, was the act defining the power of the President to withdraw lands from entry, the act separating surface titles from mineral rights in the case of coal lands, and that establishing the Bureau of Mines. All these have met with general approval, and they evidence the fact that when public sentiment becomes sufficiently concordant and strong to induce Congress to legislate, good laws are apt to be the result. The Bureau of Mines was established in July and Mr. J. A. Holmes appointed Director in September. While there was some friction over the appointment, it has disappeared and everyone is now working cordially to assure the success of the new Bureau. So far, the work has been largely confined to investigations relating to coal mining and, quite properly, the main emphasis has been placed on improvement of conditions as regards health and safety of the men. The Bureau has equipped a number of demonstration cars and is carrying on a campaign of education at the mines themselves. At the same time the cars are available for mine-rescue work and as temporary hospitals in case of accidents. Apparently the new work is producing quick results, as accidents during the last year have been less serious than before. It is inevitable that some will occur, as in the operation of the best conducted railroads, but the number can and must be steadily decreased. It is hoped that this service may be rapidly extended so as to benefit the metal as well as coal miners, and it is further expected that systematic technical investigations of mining and metallurgical methods will shortly be undertaken. The readiness of Congress to support good work when well done has been shown by the growth of the appropriations for the United States Geological Survey, and a cheering sign of the times that came just at the close of the year was the appropriation, without any opposition, of $100,000 for the work of the Geological Survey in Alaska during the next year. Mr. A. H. Brooks and his associates have done well and it is good to know that the fact is so well appreciated. The sum now appropriated for this branch of the Survey work just equals the amount given Clarence King for the whole, when the Survey was organized. This and more is required, however, if information, evidently much needed, regarding the great northern country, is to be placed before the public. The most bitter controversies that have arisen regarding conservation matters have centred on Alaska, and it would evidently be economical to collect as rapidly as possible, full and authoritative data regarding its resources. Change in the methods of disposing of mineral found on public land is inevitable and desirable. It is of the utmost importance, however, that such be based on full information and that rights acquired prior to the change be fully protected.

The Clifton-Morenci District of Arizona—III

By William L. Tovote

Machinery.—As far as mining machinery goes, Morenci is rather an uninteresting camp. The country, on account of its rugged character and steep hillslopes, lends itself splendidly to mining through adits. The few shafts of the district hardly exceed 400 or 500 ft. in depth, with the exception of the Coronado, which is 700 ft., and the Copper King, 900 ft. deep. There is one good steel head-frame at the Clay shaft of the A. C., but the hoist there is little used, the main shaft for the lower workings being the Humboldt. The head-frames at the Humboldt and Coronado are rather spectacular, the constructions being old wooden affairs which were patched and built up higher when new and heavier hoisting engines were installed, these being set farther back than the original machines for which the frames were built. The new Coronado hoist is the best in the district. It was installed about a year ago, after years of uncertainty with the old one, during which time it was feared that the old hoist would break down when most needed. The fuel used is now generally oil at the A. C., while the D. C. still continues to use coal for some of its boilers. Besides coal, wood was used as fuel at the Coronado until recently. The compressors are mostly good and of modern construction, but rather small, as little machine-drill work is done, considering the size of the mines. The biggest plant is at the Humboldt, of the A. C. Gas-engines furnish power for the D. C. power-house, operating electrical and smelting machinery at Morenci, and the D. C. concentrator. Gas-engines are also used at the A. C. power-plants, at Clifton, and at the foot of the Longfellow incline. The D. C. power-house is considered one of the most complete in Arizona.

Concrete for supporting heavy ground in the mines is being employed more and more by the D. C. and has proved economical. The usual mixture, I think, is 1 wheelbarrow of cement to 3 of sand, and 8 of pebbles. The A. C. has used concrete for a sort of bottom plate on which to stand the heaviest obtainable round timber in their Humboldt adit and filled the space behind with dry rock-wall. The result is an ornamental wall which costs probably about the same as the solid concrete pillars of the D. C., but lacks the strength and durability of the latter. The A. C. has an electric-haulage system operating through the Humboldt and Clay mines on the adit level, and connecting with the concentrator and head of the Longfellow incline. Otherwise mule haulage and hand tramming is employed underground. The D. C. has a narrow-gauge steam railroad connecting the mines with the concentrator and smelter. The mines of the district are all well ventilated naturally, but the caving methods tend to obstruct the air circulation, as they cut off the connection upward ra.was formerly kept open by raises to the waste of thdriving the high raises preparatory to caving also works some hardships on the men through poor air and powder gas. Some of the caving stopes have become rather hot lately, owing to lack of ventilation. Water is practically absent in these mines and a great deal of dust results from mining operations, which is, perhaps, the worst feature of the mines; especially where the ore is dropped down a great distance in the main chutes to the tramming levels.

The term 'ore' in the Clifton-Morenci district is a very flexible one, and is determined often by economic conditions, since disseminated copper sulphide and oxides are to be found throughout wide areas that do not produce paying grades of ore under present methods of extraction. In Copper mountain it is difficult to find any part of the porphyry that does not carry at least 0.5% copper. The tenor of the ore is kept at present a little above 3% copper (about 3.15%). A large amount of lower grade is mined, the average being made up by mixing with richer ores. Any change in prices of copper or improvement in concentrating would affect the result of present operating methods and conditions. Concentration is necessary and a number of large plants are in operation in the district. The D. C. concentrator at Morenci was built in two units of estimated capacity of 550 tons per 24 hours each, but is now treating an average of from 1400 to 1450 tons per day. There are 130 to 135 men employed. The engine-power is nearly 1000 hp. available, of which 800 to 850 is in constant use. The sample-mill absorbs 20 hp. The loss in tailing is between 0.6% and 0.7% copper. Concentration is at the ratio of about 6 or 7 into 1, at a cost of about 60c. per ton treated. The A. C. concentrator No. 6 is at Morenci. The older, No. 5, is idle. Built for 750 tons per day, No. 6 is treating 950 to 1000 tons in 24 hours, employing about 100 men and between 600 and 700 hp. Loss in tailing is about the same as at the D. C. mill, or slightly higher (0.7% copper). The cost is about the same. These two plants are probably the best in the district and represent somewhat different features, as the D. C. plant carries classification to a high degree before concentration is undertaken, while the A. C. plant avoids this. Sizing-trommels at the D. C. mill are ⅝-in., ½-in., 7-mm., 5-mm., and 2½-mm. The A. C. mill has one trommel screening to ⅝ in., 1 in., and oversize. The D. C. concentrator was the first of a type that has since been duplicated at Cananea and Nacozari. The A. C. plant was designed in the offices of the company by C. D. Clark and D. L. H. Forbes. The Harz jig is favored at the D. C., while the Hancock jig is preferred at the A. C. mill. For the treatment of sand and slime, Wilfley tables and Frue vanners were put in originally, the number having been increased since in both mills, with addition of Deister machines. Hand picking of first-class ore follows crushing in gyratory crushers, but facilities for this are limited in the A. C. plant. The amount of sorted ore per month in the D. C. mill is about 600 tons; in the A. C. mill, 100 tons. Water is a very important item, and it is being pumped from Eagle creek, a tributary of the Gila.

over five miles distant, against a head of about 1500 ft. A new pumping plant with Nordberg pumps has just been finished, doing away with pumping from the San Francisco river. Rigid economy is exercised. The water is run to numerous settling-tanks, neutralized, clarified with lime, and re-used. Another important item is the disposing of the mill-tailing that formerly, and occasionally still, finds its way back into the Gila, causing litigation. It is disposed of now in arroyos among the Gila foothills below Morenci canyon behind dams built largely

Packing Fuel.

of the tailing itself. The D. C. piereed the ridge west of Chase creek and constructed flumes for over three miles to carry the tailing there. Other concentrating plants are those of the Sh. C. and the A. C. (No. 1 to 4) at Clifton. The A. C. mill, at Clifton, was not built according to any systematic plan, but has grown from a small beginning. It is not considered modern and the loss in tailing is said to be about 1% copper. It includes a leaching plant for treating low-grade oxide ores. The process employed is guarded with the utmost secrecy, but is, if my information is correct, merely a system

Morenci, Arizona.

publicly outlined by Karl Schnable, an eminent German metallurgist, and consists of the application of dilute sulphuric acid and steam to oxidized copper ores. The resulting copper sulphate is precipitated on iron scrap in the usual way. The sulphuric acid required for the process is made at Clifton in the A. C.'s sulphuric-acid plant; pyrite for that purpose being mined from the Joy blanket-vein at Morenci.

Of reduction works, there are three in the district. The D. C. at Morenci, the A. C. and Sh. C. at Clifton. The Sh. C.'s smelter is considered the most modern in the district and is noted for the great length of its campaigns. The A. C. smelter is considered antiquated, even after expending over $200,000 recently in remodeling. Before the renovation was decided upon, its removal to a new site in the Gila valley was strongly urged, as its present situation in the narrow bottom-land of the San Francisco river is congested, and the haulage of concentrate, mostly down grade, would balance the up-grade haul of coke, and other supplies. The D. C. converter plant, while somewhat lacking in up-to-date mechanical appliances, makes the cheapest blister copper of any of the Phelps-Dodge plants in the Southwest, probably on account of the availability of an exceptionally favorable converter-lining, consisting of a porphyritic ore mined close to the Copper mountain fault, where a dike surrounded by shale has been almost completely kaolinized, consisting now of granular quartz, with chalcocite, pyrite, and native copper, in a mixture of clay, the

Concentrator Canyon.

ore ranging well over 4% copper. Besides this, flue-dust briquetted with clayey ore is also used for converter-lining.

The district is connected by the Arizona & New Mexico railroad (A. C.) with the S. P. at Lordsburg, N. M., and with the E. P. & S. W. at Hachita, N. M. The A. & N. M. is standard gauge, Clifton being one terminal. The Morenci Southern railroad (D. C.) connects at Guthrie, on the Gila. It is narrow gauge, like the rest of the local railways of the district. Its course through the Gila foothills up to Morenci is, perhaps, without parallel, making the steep ascent in a series of curves that culminate in four loops in the last half-mile of Morenci canyon. The Coronado railroad (A. C.) connects Clifton with Metcalf; the Shannon railroad connects Clifton with Shannon hill. Local tram and yard railroads are the A. C. steam trams from Metcalf to the foot of Coronado incline, and fr[illegible] the top of the incline to the mine; its electric [illegible] is

road at Morenci, and the D. C. steam-tram and yard railroad at Morenci. The production of the district in 1909 was 74,000,000 lb. copper, of which the A. C. produced about 34,000,000 lb., the D. C. 22,000,000 lb., and the Sh. C. 18,000,000 pounds.

The social-economic features of the district are somewhat exceptional for an American mining camp of this size. Clifton, with its reduction works, is an 'open town,' recently incorporated, with a population of about 7000, but Morenci, with between 5000 and 6000 people, and Metcalf-Shannon hill, with between 2000 and 3000, are 'closed' camps, where the companies hold, as mining claims, all the ground upon which the towns are built, as well as a large area beyond their limits. The companies run the only stores and hostelries, and control the traffic with their railroads. Only a few small fractions have been overlooked in locating claims, and these have been seized upon as sites for stores, saloons, and other enterprises typical of Western mining camps. The camps themselves, because there are no saloons, are called 'dry.' The working force is mostly Mexican with some Spaniards and Italians. The 'white' population consists of Scotch families from Nova Scotia, and Cornishmen. Of native Americans there are few, except in Clifton, where also a number of Scottish families are to be found, as the A. C. is a Scotch company. The wages of the district are, Mexican, including Spaniards and Italians: timbermen, $2.50; miners, $2.25; laborers, $1.75; piston-machine men, $2.50; hammer-machine men, $2.25. 'White': timbermen, $2.75 to $3.50 (stope-boss); machine men and miners, $2.50 to $3; foremen, $4.50; shift-bosses, $3.75 to $4.25. These wages are low in comparison with other camps in Arizona, where a flat rate of $3.50 for all underground work is the standard, and where timbermen and shaftmen draw $4 and $4.50 per day. Notwithstanding the low price, the Mexican labor is extremely efficient, if properly supervised; it is also easily handled and plentiful. In spite of the low wages, the cost of living is fully as high as in other mining camps in Arizona, or rather, if one compares the store prices at Douglas and Bisbee with those of the same company (Phelps-Dodge) at Morenci, it will be found, as a rule, the latter are slightly higher. However, the service in the D. C. store, at Morenci, is thoroughly good. A large stock of goods, first-class both as to quality and variety, is carried and it affords much better buying facilities than would be expected in a mining camp having only a few hundred white people. Besides the store, the D. C. keeps a first-class hotel, with table board at $30 per month, a pleasant clubhouse with library, reading-room, and gymnasium, and also contributes liberally to the upkeep of church service. All the companies afford free medical attendance and hospital service; paying, in case of accident, half wages, and of death, $750 insurance, provided from small monthly deductions from wages. The A. C.'s stores at Clifton, Morenci, Metcalf, and Coronado are, in spite of the same prices, far inferior to the D. C. stores as far as arrangement, [illegible]liness, and service are concerned. The former of the

company's boarding and rooming-houses are in charge of Chinamen, and are inferior to many similar institutions elsewhere, even in small Western mining camps. Board is $25 per month. The A. C. has long had, in professional circles, the reputation of being backward, but, aside from that, the visitor seems to see everywhere a lack of interest on behalf of the company in the welfare of its far-away place of business. The lack of sanitation and cleanliness, and the congestion of houses, compare very unfavorably with the conditions at the D. C. mine, which supports an efficient scavenger service and has established a 30-ft. space between houses. It is usually easy to tell by the appearance of the town where D. C. ground ends and A. C. ground begins. Frequent typhoid epidemics have occurred in the past, though the last year or two have shown some improvement in that direction. The sale of the A. C. to either Cole-Ryan or Phelps-Dodge interests, that has been pending lately, even if it should, in the latter case, make the greater part of the district a one-company affair, would certainly prove a blessing for the camp and insure for it a brighter and happier future.

As to the future of the district, it may be said that the mines of the D. C., at Morenci, have evidently a limited lease on life, should future development not disclose a workable zinc and copper deposit below the barren pyrite zone. However, the great holdings of the company along the porphyry belt between Morenci and Metcalf, and in the granite area to the north and west, have developed promising features since prospect work has been carried on more vigorously. The A. C. is more favored by the richness of its ore than in the extent of its properties, but has been less progressive in every respect. The one exception is that part of the property at Metcalf, where P. B. Scottland has done everything in his power to make an up-to-date mining camp out of a neglected assortment of mines, but even here his efforts are limited by an over-cautious board of directors. The A. C., with its richer, greater, and deeper ore deposits, has been outstripped by the smaller D. C. in everything but production. T. Colquhoun, the former president and general manager of the A. C., was the first to put this company on a paying basis, and, ably assisted by Paul Nicholas, made it a factor in the copper market. Under his administration most of the existing modern improvements were made, including the electric-haulage, concentrator No. 6, at Morenci, the leaching of low-grade oxide ores, and many other things. In later years he appeared to rest somewhat on his laurels and great things were expected from the new management. While this has accomplished much in the way of improvements in smelting, concentrating, and in improved surface appearance, the mining end is not faring well under it. For example, there are the two great deposits of the Coronado and the Longfellow veins. The first can be tapped with an adit slightly over a mile in length at a depth of 1300 ft. and more, 700 ft. of which has been proved workable by shaft sinking, as the ore continues

down. The ground between is mineralized, including several branches of the same Coronado fault-vein, that splits in its eastern part and has been successfully prospected by the Sh. C. in the Little Coronado mine. The A. C. has the Pyramid and other veins along the probable course of such an adit as here proposed, and could have had all the ground between for almost nothing. The adit has been advised by nearly every superintendent in Metcalf, but it never has been started. Instead, the ore is hoisted through the Coronado shaft from depths ranging from 500 to 700 ft., dumped in bins, drawn into cars and trammed by steam railroad for over a mile, sent down 3200 ft. on the Coronado incline, dumped into bins, drawn into other railroad cars, carried about a mile into Metcalf, dumped again in bins, and from there transported by the Coronado railroad six miles down to Clifton, to be handled by an old-style concentrator. A deep adit would avoid much of this expense.

Tertiary Lava Cliffs.

The Longfellow vein is formed by the union of the Yankie lode with the Quartzite fault. The fault is pronounced and repeats the features of the Coronado in strike, being nearly east-west, with dip steep to the south, and followed on its north wall by an irregular diabase intrusion. The Yankie lode changes its dip to the north, conforming to the dip of the fault at the juncture. The course of the fault is plain and can be followed on the surface from the Yankie mine (D. C.) across the deep trench of Chase creek, to where it disappears under the Gila conglomerate. This vein was opened from the old Longfellow inclined shaft, and adits driven for the exploitation of metasomatic orebodies to the south. Near the bottom of Chase creek, and close to the Coronado railroad level, it was found strong but leached, as was to be expected near the surface, in the underground quarries that had been worked there by the A. C. for converter-lining. Higher up on the slope, it was cut by an assessment adit driven nearly parallel and just outside of a great north-south cross-vein, that made a good orebody near its intersection with the fault. This adit was driven through the vein, which was strong but leached, through the diabase, here exceptionally wide, and into the quartzite foot-wall, and still they were looking for the vein farther ahead. Instead of following this vein from any point on the slope of the hill with an adit, a vertical shaft was sunk through quartzite and granite for over 500 feet.

Mining Laws of Burma

By C. Dawes Clark

In these times, when government ownership of natural resources has become a live question; when centralization, reservation, and reclamation are the ever recurrent topics of the day, and when the word 'conservation,' sung to various tunes and cadences has become the battle hymn of a political faction, it may be worth our while to pause a moment and observe the effect of some of these tendencies elsewhere. This may help us to discover to what extent the extension of a centralized, paternalistic control of our natural resources may be beneficial to the nation; whether these conceptions work out well in practice; how governmental ownership of mines may affect the development and utilization of natural resources; and finally, if our American economic ideals could exist and thrive under a really paternalistic government.

The Government of India represents probably the highest development of a strictly paternal government. Its comparatively few but broad and far-reaching laws, dealing frequently with the most delicate and intricate social and religious problems, are efficiently and painstakingly administered by that highly trained corps, the Indian Civil Service and its allied branches. Burma, that is upper Burma, has only been administered by the British since about 1890. The country was annexed in 1886, after Mandalay, its capital, had been seized by the troops. This was followed by several years of 'dacoity,' or brigandage, which was gradually but efficiently suppressed. The natives then settled down to a most peaceful and contented condition, and their rights and privileges have been most sedulously cared for by the administration ever since. The mining laws of Burma are thus interesting in that they represent the latest work of the Indian Government and sufficient time has elapsed—twenty years—to enable the observer to mark what progress in mining an entirely new country has made since being thrown open to civilization.

All minerals, ores, coal, oil, and precious stones are held to have become the property of the Crown. No exclusive permanent rights to any such property can now be obtained. Various classes of privileges and concessions leading up to leases can be obtained by those presumably able to do the work, under which leases the valuable natural products may be extracted on payment of royalties to the Government. This paper will deal principally with the rules governing metal mining. The forms of privileges listed below may be granted at the option of the local authorities.

The Exploring License.—This may be obtained by practically any person on application to the Deputy Commissioner of the District, and on payment of Rs. 10 ($3.33). It gives the holder the right for one year to explore and prospect within an indefinite area, as applied for, included in the district. No rights, however, accrue to the holder on any ores or minerals or valuable deposits which may be thus found, nor is

any other person prevented from exploring or prospecting the same area or deposit. The only real privilege attached to the license is the statement that in the event of two parties asking for further rights over the same deposit or area, the one holding an exploring license would receive more favorable consideration on that account. As might be expected, this rather useless license is seldom, if ever, applied for.

The Certificate of Approval.—Before any more definite prospecting rights may be granted the applicant must obtain a certificate of approval. This is granted by the Revenue Secretary of the Province acting for the Lieutenant Governor, to those presumably able to properly prospect and finally to develop and work deposits which may be found. It is good for one year and for one district only and for the particular metals sought for as stated. One of these certificates must accompany each application for prospecting license and is surrendered if the license is granted. The avowed intention of the Government in requiring such a certificate is to prevent rights to mineral wealth getting into the hands of those financially or otherwise unable to develop them properly. The effect of this restriction is not wholly that intended by its authors, and it has resulted in more harm than the reverse, in retarding the development of the mineral resources of the country, for, it not only most effectually bars out the real prospector, as we know him in America and Australia, but it causes useless delays and sometimes futile inquiries into the standing of legitimate small companies which might be fully able to prospect and develop a property with a view to transferring it to a more powerful organization if its development proved satisfactory, and yet not possess at the outset sufficient means to carry on large mining operations. At the same time, too, in spite of the intention of the laws to keep out undesirable applicants for prospecting licenses, various 'experts,' 'mining engineers,' and others, do at times succeed in blarneying certificates of approval from the government officials; and thus a species of wild-cat finds a habitat in Burma as well as elsewhere.

The Prospecting License.—These are granted over definite limited, but not necessarily surveyed, areas by the Deputy Commissioner of the District to parties possessing a certificate of approval. The application must contain a map and a suitable description of the boundaries of the property; the shape of the tract may not in length exceed four times its width. The area which may be taken up varies with the metals sought, and in the case of the precious metals cannot exceed one square mile without special sanction of the Government of India. The prospecting license is granted for one year only and may be renewed at the option of the Government for one or more successive years. A deposit of Rs. 100 ($33.33) is required. This deposit is returned on the expiration of the license if its provisions have been observed by the licensee. The grantee of such a license may enter upon the land and conduct any sort of mining operations. He may extract minerals, or metals, and remove them provided he pays the stipulated royalties to Government. These royalties vary with the value of the metal contents. In the case of iron the royalty is the absurdly low figure of one-half anna (1 cent) per ton, in the case of lead, copper, etc., the royalty is 2½% of the net value of the contents, while in the case of gold and silver the royalty is 7½% of the net recovery of the metals. The royalty for precious stones is 30% of the net profits of the company. There are other restrictions attached to the license. The licensee must pay suitable compensation to any agricultural interests injured by his operations at prices adjusted by the Deputy Commissioner; he may not cut any tree over 8 in. diam. without first obtaining permission from that overworked official, and at the expiration of his license must fill up or fence in all excavations and working places. The rights conferred by the license may not be transferred without first obtaining the sanction of Government. The prospecting license, if its provisions are observed, gives the grantee the right to a mining lease on the property, subject, as always, to the approval of the local government as to the fitness of the owners financially and otherwise to conduct more permanent mining operations.

The Mining Lease.—This may be granted by the local government (that is, the Lieutenant Governor of the Province and his staff) over the same areas for which prospecting licenses are granted and on reference to the Government of India the area may be extended to 10 square miles. In special cases, on reference to the Secretary of State for India, certain concessions have been granted over still larger areas. The mining lease may be drawn up for any period up to 30 years and subject to the same royalties the lessee may conduct any mining operations needful, subject to the additional rules covering accidents, inspection, etc. A fixed ground rent of 8 annas (16c.) per acre is levied annually and a further rent for such land as is actually occupied by mining operations or otherwise used and improved. These rents are, however, deducted from any royalties paid, so that when the royalty exceeds the ground rent, no rent, as such, is paid. Two recent leases covering the metals, lead, copper, etc., read that the royalty paid should be 2½% of the net value of the ore at the pit mouth, said value to be computed from the current London prices for the ore less the cost of its transport to London. In the case of gold and silver, the royalty may, at the option of the lessee, be changed to become 7½% of the net profits of the mining company. The lease stipulates the metals covered by it and it is conceivable that two or more lessees might be working in the same area for different metals. Bi-annual statements of tonnage and assays are required of the lessee and the property itself or the company's books are at all times subject to government inspection.

Laws Referring to Explosives.—With the Los Angeles *Times* disaster so fresh in memory, it will be of interest to note that the laws governing the sale, transportation, and possession of explosives in Burma are very strict and are stringently enforced. No explosives may be bought, transported, or possessed without a special license covering the particular

purchase, shipment, and use of the definitely designated quantity. These licenses are obtainable from the Deputy Commissioner of the District wherein the explosives are to be used. They can only be obtained by parties known to the officials as suitable and proper persons really conducting operations requiring the use of explosives. The explosives must be kept in standard magazines scientifically designed to minimize risk of accident, or theft. These licenses are rather difficult to obtain, and may cause delay in conducting operations, and the multiplicity of rules covering the safe transport of the explosive make the freight a very heavy item; yet it would seem that greater precautions in limiting the ownership and use of explosives might well be advisable in the United States.

How the Laws Work in Practice.—Whatever may be the merits of the above methods of handling a country's mineral wealth, it must be admitted by any impartial observer that the mining laws have had the effect of retarding the mineral development of the country. Burma, with its 239,000 square miles, spreads through a considerable range of latitude and longitude, being over 1200 miles long, in a north and south direction. It presents a great variety of topographical conditions, and rocks of numerous geological ages are exposed. Ores and minerals are widely distributed, as proved by the numerous and varied samples brought in by the natives. But as yet very little is known of these ores as prospective mine-makers. Two gold-dredging companies, one of which is paying well, and two lead-silver prospects undergoing development, and some alluvial tin workings represent the sum total of the metal-working activities of the country at the present time. I do not claim that Burma is remarkably rich in ores, or especially alluring to the mining world, but merely that little is now known of its possibilities, and under the existing laws it is probable that very little will be known for a long time. There is not, to my knowledge, a single real prospector in the country, and there is no place left for him and no inducement to draw him thither. Nor can prospecting of a general and inceptive character be either economically or intelligently done by a mining company; nor is the usual technical man who might be in charge of such operations best fitted for conducting prospecting operations. What is needed to open up the country is the hardy, alert prospector, who puts his own time and work, and usually his own fortunes and hopes into the ground, showing up the leads, usually on the verge of starvation, yet somehow managing to exist and to turn up at intervals showings that are worth buying at a reasonable price on the chance of further work developing a paying property. Thus, while losing the services of the prospector, no commensurate advantage is gained in the attempt to restrict the possession of mineral rights to those possessed of sufficient capital to work them. Indeed, such a precaution seems quite unnecessary, for judging from results in the United States under our policy of *laissez faire*, the properties of merit gravitate capitalward quite fast enough. Nor are failures by any means wholly useless; indeed, they are one of the most patent factors in developing the mining industry of any region. In most cases the good properties are made out of several successive expensive failures, each one bringing the property more nearly into the condition in which its work can be finally undertaken with confidence on a proper scale with approved appliances and an assured success. If it is true that mines are not found, but made, then it is also true that most of them are made out of the bones of several earlier companies, each one of which has contributed in its hopeful, futile way its all to the making of the property. To attempt to legislate as to who shall own mining rights will always be an economic crime, and as such will speedily be corrected by the inexorable economic laws to which any nation and country is more surely subject than to those in the statute books. In operating under this leasing system, there are uncertainties and difficulties which the investor must, if he is wise, take into consideration as well as the usual labor and climatic drawbacks inseparable from tropical work. Leases can not be made to cover every conceivable contingency, and their interpretation is left to a somewhat autocratic and arbitrary government. As an example of one of the many difficult questions to handle under a leasing system, I will note the case of one lead-mining company working in ore containing about 40% Pb as well as 19% Zn, the latter in a form not separable from the lead by any known mechanical process. As the ore was smelted the zinc was not only lost, but was a detriment to the ore to the extent of $5 or more per ton; yet the Government demanded that royalty be paid on the zinc content. This brings up a whole series of nice questions as to what is metallurgically or economically possible. It illustrates some of the difficulties that arise when rather general laws are left to the enforcement of well-meaning but technically ignorant officials. A still more serious question to handle under the leasing system is the waste of ore; how much may be left in the mine? By what method must the mine be worked? Who can prescribe the right balance between working costs, extraction, safety, and losses, but the one who is not only the operator but the real owner of the property? All this tends to decrease the value of a Government-owned property and must be allowed for by the wise investor. By all means, let our mines be privately owned and handled as the conditions demand. If the Government must have a royalty from its mineral wealth, it will be better to take it in the form of a tax on profits.

The deepest gold mine in the world not long since was that of the New Chum Railway company at Bendigo, Australia, down 4120 ft., but this has now taken second place, the shaft on the Victoria Consolidated, also at Bendigo, having reached 4600 and going to 5000 ft. This is deeper now than that of the deepest gold mine in America, the Kennedy, at Jackson, California, by more than 1000 feet.

The Petroleum Industry in California

By Ralph Arnold

*Santa Maria District.—The Santa Maria district lies in the northwestern part of Santa Barbara county and comprises the Orcutt or Santa Maria field proper, the Cat Canyon field, and the Lompoc field. The first mentioned furnishes a large percentage of the refining oil of the State, its yield ranging from 24 to 27° Baumé in gravity and from 20 to 1000 bbl. per day in individual production. The Cat Canyon field yields 12 to 16° Baumé oil, the individual daily production varying from 75 to 8000 bbl. The Lompoc field yields oil of 14 to 35° Baumé gravity, the individual production varying from 20 to 600 bbl. per day. Two pipe-lines of the Union Oil Co. and one of the Standard Oil Co. connect the field with Port Harford, while a line of the Associated Oil Co. runs to Gaviota. The Palmer Oil Co. is now considering the extension of its recently acquired line to some point on the tide-water.

Attention in the Santa Maria district has been centred mainly in the Cat Canyon field, which came into prominence over two years ago through the advent of Palmer well No. 1. The Palmer company is still the most important producer, its well No. 2, which came in during June of this year with a production of from 5000 to 8000 bbl. per day, of 15° Baumé oil, being the best producer yet recorded for the Cat Canyon area. In addition, wells No. 3 and 4 of the same company are being finished with every prospect of becoming good producers. Las Alamos Petroleum Co.'s well No. 1, a mile north of the Palmer, has found promising sands and has flowed at times, assuring a good production when the 'sanding up' caused by heavy gas pressure has been remedied. The oil coming from this well at present is a little heavier than that of the Palmer, but a better grade will probably be found after the well has produced for some time, as has been the case with all of the wells in the field. About two miles east of the Palmer, the New Pennsylvania and Brooks oil companies have each brought in producers, the former's yielding very heavy oil that has made its recovery difficult, the latter's yielding oil of 14 to 15° Baumé gravity at the rate of 500 to 600 bbl. per day. The Brooks well is the farthest east of any of the producers in this district. Other wells varying in capacity from 150 to 1500 bbl. per day have been brought in or increased in capacity by the Dome and Union Oil companies, near the Palmer. The Summit well three miles north of the Palmer, the Carpinteria well three and one-half miles east, and the Princess and Dome wells seven or eight miles southeast of the developed part of the field are prospects that offer varying degrees of evidence of success. A well is being started in the region of Tepusquet creek that should test the possibilities of the region northeast of the Cat Canyon field. Other drilling wells that will materially extend the limit of the same field, are being drilled north of the New Pennsylvania and Brooks wells. Drilling in the region of the Santa Ynez has not been attended by any marked success. The wells south of the Santa Ynez river known as the Las Cruces and Micaela, have been abandoned and the San Lucas, four miles southeast of Santa Ynez, is still drilling at over 3000 ft. with only remote chances of success. The wells in the eastern end of the Purisima hills west of Santa Ynez have so far failed to encounter commercially productive sands.

The Orcutt, or Santa Maria field, has been extended only slightly to the southeast, the extension being due to the bringing in of several wells by the Western Union Oil Co. along the eastern border of its property. The wells, though not large producers, have yielded a good quality of oil in fair quantities. The well of the Los Flores Oil Co. to the east of the new Western Union wells, and between the Santa Maria and Cat Canyon fields, have not shown oil at the depths at which they were expected to produce. Some new wells have been put down in the proved area of the old field, but not as many as would have been, had not the Union, the holder of a major portion of the field, largely transferred its activities to the Midway district during the early part of the year.

Considerable territory was added to the proved area of the Lompoc field by development during the year. Toward the east the field was extended by the Federal well which found the light oil-sands originally penetrated by the famous 4400-ft. well of the Los Alamos Oil & Development Co., a mile or so west. Still farther east and south of the Federal well, the Lompoc Oil & Development Co. has succeeded in securing oil at about 4400 ft., while west of the latter a 150-bbl. daily production is secured from a well 2800 ft. deep by the Gem Oil Co. Development at the western extremity of the Purisima hills has resulted in the bringing in of several good wells on the Effson lease of the Union Oil Co. and several other properties. Little development has taken place in the main part of the Lompoc field, especially since the Union Oil Co. has been bending its energies toward developing its properties in the Midway and Sunset districts. One or two wells are being drilled in the region of Casmalia west of the main Santa Maria field with, as yet, undetermined results. The old Southern Pacific well north of Casmalia is still the only producer in this part of the district.

Santa Clara Valley District.—Considerable development has taken place in Ventura county owing to the fact that the light-gravity or refining oil is obtained in several of the different fields of this part of the State. The greatest development has probably been in the Upper Ojai valley, where the Bard, Pyramid, and two or three other companies have been bringing in some good wells. Development has also been quite active in the Little Sespe country, where the Cosmopolitan Oil Co., D. L. Peters, and several other interests have drilled productive wells into the light formation. Some 100-bbl. wells of 34° gravity oil have been reported among those

*Continued from *Mining and Scientific Press*, page 76.

drilled. Development is being carried on in practically all of the fields along the south side of the Santa Clara valley. One well in particular, that of the Montebello Oil Co., just east of the Bardsdale wells of the Union Oil Co., has attained a depth of about 2400 ft. and has found a considerable thickness of what is believed to be producing sand. Other new wells are being started just east of here and also south of Santa Paula. In the region of Sulphur mountain two or three holes are now going down with the prospect of securing more or less oil from the Monterey or Modelo shale formation which comprises the greater part of this prominent ridge. There is also some new development in the canyons immediately in front of and to the south of Sulphur mountain, where the Union Oil Co. and E. E. Henderson are endeavoring to increase their production of light-gravity oil. One new well of importance has been completed in the Simi valley, south of the Santa Clara Valley district. This is the well of the Search Oil Co., which has brought in a 250-bbl. well of 18° gravity oil at 1800 ft. This showing in a new field is encouraging and indicates the possible addition of another in Ventura county.

Los Angeles and Puente Hills Districts.—Little new work has been done in either of these districts during the year, a slight southward extension of the Olinda field and the bringing in of one or two exceptional producers at the western end of the Brea Canyon field being most important. A well which gives more promise of success is being drilled on the Fundenburg ranch near Spadra, north of the Olinda field. The success of this will mean the continuing of exploratory work on the north flank of the Puente hills. A few new wells were brought in in the Sherman field west of Los Angeles, but nothing that can be considered of importance transpired in this part of the district. East of Los Angeles and near the city limits the Dollar Oil Co. is said to have found favorable indications in its prospect well.

Other Districts.—In addition to the developments mentioned above, there have been prospect holes put down in the vicinity north of Fresno, with negative results to 1800 ft., where the hole was abandoned. Two or three wells have been drilled or are being put down in the Cholame district in southeastern Monterey county. Developments in the Lone Oak district of eastern Monterey county have been abandoned after several wells reached the granite formation which underlies this district without finding commercial quantities of oil. On the west side of the Salinas valley there have been one or two wells drilled, but so far without positive results, although the wells are still drilling and show some indications of ultimate success. Some development has taken place in Humboldt county. One well, drilled on the Bonanza ranch of Z. Russ & Sons Co. on Bear River, has been temporarily abandoned after striking small amounts of gas and oil. Drilling at another well, that of the Mattole Development Co., near the town of Petrolia, has also been temporarily suspended, although good indications of oil are found on the surface. Still a third well, three and a half miles northwest of Petrolia, attained a depth of 700 ft., and it is reported that sufficient gas to run the engine was found. Operations are being continued. Two wells were drilled during 1910 in the Los Gatos field, but it is impossible to secure definite information. It is believed that they were not especially successful. Development is just beginning in the Valleeitos district, forty miles northwest of Coalinga. A limited area in this district is believed to reproduce the conditions of the Coalinga field on a miniature scale, and some fairly good producers will probably be brought in here. Work on the Carrizo plains is confined to one well which is now being drilled by Honolulu capital, two miles southeast of White's camp. Drilling here has not progressed far enough to indicate anything as to the possibilities of the territory. Two or three wells are now being put down in the San Emidio district due south of Bakersfield and twenty miles east of the Sunset district. Surface indications here lead to the belief that a limited area may furnish some fairly good producers of fuel oil. In the vicinity of Petaluma one or more wells have been put down, but it is difficult to obtain authentic information with regard to results obtained. It is believed, however, that with the exception of moderate quantities of gas, nothing of importance has been found. No work of importance has taken place in the Summerland field, and the wells in this old and well-known district are fast becoming unproductive owing to drainage of the oil and the increase of the amount of water. Considerable activity is being displayed by prospectors in San Diego county. Among the most active are the Otai Valley Oil Co. and the Otai Segunda Oil Co., both in the Otai valley. A showing of oil is said to have been found in the well of the first-named company. The Beaver Oil Co. is also drilling east of San Diego. In the region of Tia Juana, the Tia Juana Oil Co. and the Lotengo Oil Co. are either drilling or preparing to drill. North of San Diego the Pacific Laguna Oil Co. has a well down 500 ft., while the San Elijo, which owns 6000 acres between Encinitas and San Diego is preparing to start operations. No commercial wells have yet been brought in in the county. Development in the vicinity of Newport has not been followed by any successes. The Kellerman, Balboa, Tidewater, and Clyde Jackson Oil companies have suspended or abandoned their holes. The Newport Bay Oil Co. has drilled two holes, which have been abandoned, but is working on the third.

Frost contributes more to the disintegration of rocks than any other one agency. If the rock be at all porous and water be present in the small interstitial spaces when the temperature is above 32° F., the moisture freezes when the temperature goes below 32° and the disrupting force of the ice formed is tremendous.

Few of the dredges working in the auriferous gravel beds of California are mining on the original bedrock, but are excavating gravel from the surface down to the 'false bedrock', generally volcanic tuff. The original bedrock is usually either greenstone schist or slate—sometimes granite.

Copper Production in 1910 by States

Statistics and estimates received by the United States Geological Survey from all plants known to produce blister copper from domestic ores and from all Lake mines indicate that the copper output from mines in the United States in 1910 will fall considerably below the output of 1909, but will exceed the production of any other previous year. The production by States follows:

Arizona.—For 1910 Arizona again takes the lead among the copper-producing States with an output slightly above the production of 1909, which was 291,110,298 lb. The Bisbee district was the largest producer, with an output of approximately 145,000,000 lb., as compared with about 130,000,000 lb. for 1909. Developments during the year in the old mines of the district were encouraging, especially in the deeper workings. The output of the Morenci-Metcalf district for 1910 will show little change from the production of 72,000,000 lb. in 1909. The Globe district made an output of about 27,000,000 lb. as compared with about 33,000,000 lb. for 1909. In the Miami portion of this district there was great activity throughout the year in development and construction. The Miami Copper Co. practically completed its mill and will begin production early in 1911. The concentrate will be smelted at Cananea, Mexico. Considerable ore was added to the reserves in blocking out the ore for extraction. The Inspiration Copper Co. was actively engaged in development, and it is reported as having, on October 20, developed ore amounting to 12,396,000 tons, and 5,604,000 tons of partially developed ore averaging 2% copper. An experimental mill was operated during the later part of the year. The Live Oak, Black Warrior, and other mines of the district have been developing ore during the year. At Jerome the United Verde mine was operated throughout the year and the output will probably show but little variation from the 36,700,000 lb produced in 1909. The Sasco smelter of the Southern Arizona Copper Co. was closed for the later part of the year and the output of the Silver Bell district will not exceed 6,000,000 lb., as compared with 10,500,000 lb. for 1909. The Humboldt smelter of the Consolidated Arizona Copper Co., Yavapai county, and the smelter of the Clara Consolidated Copper Co., Yuma county, were in operation the later part of the year. In the Mineral Creek district development and construction were active. The Ray Consolidated and Gila Consolidated companies were merged during the year. The first units of the concentrating plant at Hayden will be ready for operation early in 1911, and work on the smelter is well advanced, though the smelter will be completed considerably later than the mill. The Ray Central mine is reported to have 10,000,000 tons of ore developed. A small experimental mill was in operation on this property for a part of the year, but construction of a permanent mill has not been started.

Montana.—The copper production of Montana will probably not exceed 285,000,000 lb. for 1910, as compared with 314,858,291 lb. for 1909.

The most important event in the Butte district during the year was the consolidation of the Amalgamated companies as the Anaconda Copper Mining Co. and the purchase by this company of W. A. Clark's copper interests, including the Butte Reduction Works, which were closed. This consolidation was desirable to avoid the numerous controversies that arose concerning the ownership of orebodies, and also to reduce the cost of production by bringing the companies under one management.

Michigan.—Michigan, ranking third as a copper-producing State, made an output of refined copper of about 220,000,000 lb. in 1910, as compared with 227,005,923 lb. for 1909. The most important developments of the year were those carried on at the Lake and neighboring properties.

Utah.—Utah, ranking fourth among the copper-producing States, made a marked increase in production over that for 1909, which was 101,241,114 lb. The production was mainly from the Bingham district. The most important event in this district during the year was the consolidation of the Boston Consolidated and Utah Copper properties. During the year the mills of the Utah Copper Co. at Garfield have been remodeled and their capacities greatly increased. The Yampa smelter was closed for the later part of the year and the mines previously furnishing ore to this smelter shipped their output to the Garfield smelter. The Tooele plant of the International Smelting & Refining Co. was completed and in operation the later part of the year. This smelter was operated mainly on ore from the Utah Consolidated Copper Co.'s mines and concentrate from the Cactus mine, Beaver county.

Nevada.—The production of copper in Nevada for 1910 was about 64,000,000 lb. as compared with 53,849,281 lb. for 1909. The output was mainly from the Ely district, the ores coming entirely from the Copper Flat pit. During the later part of the year the Liberty area was being stripped preparatory to mining. The Giroux Consolidated Mining Co. continued development of its ores and the preparation for extraction, but made no production during 1910.

California.—The output of copper from California will show a decrease in 1910 from the output of 53,568,708 lb. produced in 1909. The decrease is due to the necessity of controlling the smelter fumes in the Shasta County district. An agreement was made between the Mammoth and Balaklala companies and the farmers, by which the smelters were to be provided with fume-controlling devices. The Mammoth company constructed a bag-house similar to that previously operated at the Midvale, Utah, plant of the United States Smelting, Refining & Mining Co. This plant is reported to be operating successfully, but has not been able to handle the fumes from all the furnaces previously operated by the company. The Balaklala company installed the Cottrell process and this is also reported to be operating successfully, but like the Mammoth

smelter the Balaklala has not been operated at full capacity. The Bully Hill Copper Co. has not installed a fume-controlling plant and the smelter at Winthrop was closed and the output of the mines shipped.

Tennessee.—Tennessee will also show a decrease for 1910 from the output of 19,207,745 lb. for 1909. This decrease is due to the fact that the sulphuric-acid plants operated by both companies in the Ducktown district were not able to handle the fumes produced by the smelting plants when they are operated at full capacity. The capacities of the acid plants are being increased and the output of the district should show an increase in 1911. The successful recovery of acid at these plants of the Tennessee Copper Co. has added greatly to the value of the ores mined in the district.

Colorado.—Colorado contains no important copper district, its main output of copper being incidental to the recovery of other metals. It will probably show no great change from the output of 11,485,631 lb. in 1909.

Idaho.—The copper output of Idaho in 1910, as in previous years, was mainly derived from the Snow Storm mine, of the Coeur d'Alene district. The copper smelter of the Lost Packer Mining Co. at Ivers was idle in 1910.

New Mexico.—In 1910 the chief activities in New Mexico consisted of development. In the Santa Rita district the Chino Copper Co. developed a large deposit by churn-drill and during the latter part of the year a portion of this deposit was being stripped preparatory to mining by open-cast methods. Late in the year it was estimated by the company's officials that more than 30,000,000 tons of ore, with an average copper content of 2.6%, had been developed. The company's mill at Hurley was in process of construction during the later part of the year and the company should be producing late in 1911. In the Burro Mountain district active development was carried on, especially by the Phelps-Dodge interests.

Alaska.—According to estimates made by the Geological Survey the production of copper in Alaska in 1910 was about 5,600,000 lb., as compared with 4,057,142 lb. for 1909. The increase was principally in the Prince William Sound district. The Copper River railway was completed as far as Chitina at the end of September. This should reach the Bonanza mine in time to permit the shipment of considerable ore during 1911.

Outlook for 1911.—So many factors enter into the determination of the output of copper that a forecast of the probable production for 1911 is of little value. During the later part of 1910 several of the large companies were reducing their output and it is probable that this policy will be continued into 1911. Two large companies, the Miami Consolidated and the Ray Consolidated, will begin production early in the year, and the Chino Copper Co. and probably the Bonanza mine of Alaska will be producers late in 1911, so that unless there is a decided curtailment by the older companies the output for 1911 will exceed that of 1910.

Coal Mining in 1910

By E. W. Parker

According to reports received by the United States Geological Survey from coal-mine operators and others familiar with the industry, the production of coal in the United States during 1910 was between 475,000,000 and 485,000,000 short tons, a considerable increase from the output of 459,715,704 short tons in 1909 and approximately within 1% of the previous maximum record of 480,363,424 tons produced in 1907. The most important factor influencing the coal-mining industry in 1910 was the prolonged strike in Illinois and the Southwestern States. This strike or suspension, which started on April 1 pending an adjustment of the wage scale, was not finally settled until September 15, and after that date much time was lost in putting the mines into condition for operation, so that the period of idleness in the mines affected was fully six months. The settlement was a practical surrender of the operators to the demands of the miners, with an increase of 5.55% in wages. A similar increase was granted in a number of other States, either before the strike was called or during the suspension or subsequent to it. During the idleness many of the miners who were on strike in Illinois obtained employment in the mines of competitive States and helped to increase the output of those States, which offset the shortage in the States affected. Notable increases in production were made in the western counties of Kentucky, in western Pennsylvania, and in Ohio, West Virginia, Alabama, Colorado, New Mexico, and Montana. The States whose production was reduced by the strike were Illinois, Kansas, Missouri, Arkansas, and Oklahoma. It was claimed by the miners' organization that on June 1, 1910, 70,000 miners were idle in Illinois, and 35,000 in the Southwest—that is, in Kansas, Missouri, Arkansas, Oklahoma, and Texas. About the middle of May the operators of two important districts in Illinois seceded from the Illinois Coal Operators' Association, which was in contest with the miners' union, accepted the miners' terms, and went to work. Other mines which were not represented in the association were also operated during the strike, so that from 25 to 30% of the normal output of the State was being produced at the time the strike was ended, and this continuous production was a potent factor in bringing the operators to terms with the miners. Of the total production in 1910 the anthracite mines of Pennsylvania contributed nearly 83,000,000 short tons and the bituminous mines between 390,000,000 and 400,000,000 tons.

The influence of the strike in the coal-mining States of the Mississippi Valley region was felt as far west as the Rocky Mountain States, especially in Colorado and New Mexico, whose coal was sent considerable distances east and southeast in order to make up the deficiency caused by the strike. An increased production in Colorado was obtained notwithstanding the fact that the strike on April 1

also affected the lignite or sub-bituminous producing districts in that State. The tonnage from the lignite fields in 1909 was artificially large and low prices prevailed accordingly. The coal produced in 1910 sold for a much higher price, and since April 1, when the strike was declared by the United Mine Workers of America, has been largely produced by non-union labor.

Colorado.—Colorado's coal production in 1909 was 10,722,746 short tons. The increase in 1910 was about 20%, so that the output in that year was approximately 12,000,000 tons. The unusually large demand for Colorado coal in 1910 was for the use of the railroads running between Colorado and Missouri river. There was also a better domestic demand during the summer months, and a larger quantity of coal for winter use was stored during that time. There was an unusually large number of mine disasters in Colorado during the last months of the year, most of them being due to mine fires, sometimes accompanied by and sometimes free from explosions. The explosions which occurred in the gaseous mines were responsible for the large death list. In the fires that were unaccompanied by explosions the men were suffocated.

New Mexico.—In New Mexico the coal trade was brisk throughout 1910, resulting in an increased output of 30% over the preceding year. The operators attributed three-fifths of the increase to the closing of the mines in other States and two-fifths to the normal growth and to the requirements due to improved business conditions. One of the benefits accruing to the coal-mining industry of New Mexico in 1910 was the reduction in the freight rates on foreign coals by the Mexican railroads. J. E. Sheridan, United States Mine Inspector for New Mexico, gives the total production of coal in New Mexico in 1910 at 3,684,627 short tons. He also reports that there were 15 persons killed in the mines during the year—9 by falls of rock, 5 by falls of coal, and 1 by picking into a missed shot. Mr. Sheridan calls attention to the fact that all but one of these accidents were due to the negligence of the miner in not properly timbering his working place.

During 1910 great improvements were made in the methods of operating the mines. Each of the three larger operating companies has employed mine inspectors whose duty it is to look after the safety of the men employed. In addition to these mine inspectors the fire bosses and shot firers must also report any unsafe conditions in their respective districts, and when an accident occurs whereby any person is injured in the mine, the circumstances and conditions are immediately investigated to discover if the workmen were allowed to go into an unsafe working place, and if so, the fire boss or shot firer who neglected to report such unsafe condition is held responsible. The larger mines employ shot firers or explode the shots by electricity, and all shots are exploded after the miners and others (except the shot firers) have left the mine.

Utah.—J. E. Petit, the State coal-mine inspector of Utah, reports that the coal production of that State in 1910 amounted to 2,526,093 short tons, as compared with 2,269,481 short tons in 1909. The increase was normal, as the production in Utah was not at all influenced by the strike conditions in the Middle States.

Montana and Wyoming.—As Montana and Wyoming are more distantly removed from the scene of the labor troubles in 1910, the increased coal production in these States was not so large as in Colorado and New Mexico, although some Wyoming coals were sent to points in the Eastern plains regions that had been supplied by Illinois, Kansas, or Missouri fuels. As far as Montana was concerned, the most interesting developments are those following the completion of the Chicago, Milwaukee & Puget Sound railway. These developments were in the Bull Mountain field, in Yellowstone county. This field did not produce any coal in 1908, but in 1909 its output amounted to 188,837 short tons, and at the close of 1909 the mines of the field had a combined capacity of 2000 tons per day. At the close of 1910 the daily production in the Bull Mountain field was about 3000 tons.

The total production of coal in Montana increased about 500,000 tons in 1910 over 1909. The announcement by the Chicago, Milwaukee & Puget Sound and the Great Northern railways of their intention to use oil exclusively in their locomotives from the Pacific Coast as far east as Butte, Montana, will if carried out have some influence on the production of coal in both Montana and Wyoming in 1911.

Pacific Coast States.—Washington is the only one of the Pacific Coast States in which coal mining is an industry of importance. The total production of California, Alaska, and Oregon in 1910 did not amount to much more than 100,000 short tons. There was in Washington, however, notwithstanding the renewed and increased aggression of fuel oil, a decided increase in the production of coal at the commercial mines. The railroad mines, or those operated by the railroads or subsidiary companies for the exclusive use of the railroad companies themselves, showed about the same production in 1910 as 1909. Outside of the railroad mines, however, the production in some mines increased as much as 50%. The total production of the State was between 4,500,000 and 5,000,000 tons, as against 3,576,406 tons in 1909. To what an extent the coal-mining industry of Washington will be affected by the increased use of fuel oil on the railroad locomotives is a problem. During 1910 the Northern Pacific railway equipped 30 oil-burning locomotives for yard and switching purposes and for its fast passenger service. The Chicago, Milwaukee & Puget Sound and the Great Northern railways have announced their intention of using oil exclusively throughout their mountain service.

The lack of coal production in California is made up by the enormous increase in the production of petroleum, most of which is used for fuel. The production of petroleum in California in 1910 aggregated between 65,000,000 and 70,000,000 bbl., which, on the basis of 3½ bbl. of oil for each ton of high-grade coal, would be equal to a production of nearly 20,000,000 tons of coal in that State in 1910.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

State Mineralogist

The Editor:

Sir—An editorial in the issue of the *Mining and Scientific Press* of December 31, mentions my name, among others, as having been suggested for the office of State Mineralogist. I must say my health would not now permit me to undertake the responsibility, and I am not a candidate for the office. In my opinion, there is some serious work required to make the Mining Bureau an institution to represent, in a worthy manner, the industry which first gave to this State its world-wide reputation. I believe the appointee should be a somewhat younger man, who, in addition to the qualifications of technical training and ample experience, has a good store of energy left over and available for strenuous effort.

Surface Indications of Ore-Shoots in Depth

The Editor:

Sir—I am pleased to note that my contribution to this subject in the issue of October 22 has attracted some attention, and brought forth comment from several gentlemen. There seems to have been somewhat of a misunderstanding as to what was meant in the latter part of the fourth paragraph, marked No. 2, in which the following occurs: "Should the fault or flexure have a dip, one way or another, from the vertical, the ore-shoot may take a similar trend or pitch along the fissure in which it occurs, but eventually the shoot will be found to terminate when the region of disturbance is reached, whether it is vertically beneath the break, appearing on the surface, or in depth, at some distance to one side of it."

It must be remembered that the condition described contemplates that the fault or flexure crosses the vein, and that this fault or flexure may have a dip as well as the vein itself, and that an ore-shoot occurring in the vein may have a 'pitch' or 'rake' along the plane of the vein. It is the result of my observation that shoots of ore usually come to an end at the surface, upon reaching a depression, ravine, or gulch crossing the strike of the lode (which is generally due to the occurrence of a flexure or fault), and that, as the mine workings are carried down to depth the disturbance caused by the flexure or fault will be found to be continuous and that the ore will not pass through the region of disturbance, or if it does, will generally be of much lower grade, although the vein may continue. Charles Janin, in the issue of November 19, presents two longitudinal sections of mine workings to prove that the theory advanced in my original contribution is weak, and not substantiated by facts. Concerning one of these mines I know nothing and am willing to admit it as negative evidence; of the other, I am told by the manager that considerable stoping was done beneath the gulch that was not justified by economic results, proving at least that the workings of a mine do not always sharply define the limitations of profitable ore. An inspection of the longitudinal maps of a mine is not sufficient in arriving at conclusions regarding this matter. Maps of mine workings are not always a safe index as to what has actually been discovered and removed from all parts of the vein, unless accompanied by figures showing width of vein and assay-value of the ore throughout. To judge correctly, one must actually learn what ore was found at any particular place in the mine. Stopes are frequently carried beyond the limit of profitable operation, but mine maps do not always convey this desirable information.

A fault occurring subsequent to the formation of a vein will, of course, displace the vein to the extent of the throw of the fault. In such cases the continuation of the vein may usually be discovered on the opposite side of the fault. Moreover, a fault may pass directly through an orebody or shoot, and in such case the ore will be found to terminate when the plane of the fault is reached. This phase of the discussion may not therefore be considered, as it is more particularly the discontinuance of an ore-shoot upon reaching a gulch, or depression, that was referred to. I have found that many gulches and depressions are due to a flexure in the strike of the rocks, particularly where these rocks were slaty or schistose. In massive rocks they are probably often due to similar causes, though a flexure would perhaps not be so apparent as in a schistose or slaty rock, in which any torsion of the rocks may usually be plainly seen. Gulches may result wholly from erosive agencies, and have no connection whatever or be influenced by flexure or fault. Such instances are found in regions where glaciers exist, or have existed, the ice in many places cutting channels in the rocks regardless of their structure.

On the Mother Lode of California, ore-shoots are very seldom found to cross depressions or gulches *at the surface*. There may be exceptions to this rule, doubtless there are, but I do not happen to know of them. I am aware of many other places, as well as those on the Mother Lode, where the same condition is found to obtain. I am merely stating the fact; the reasons for it may, perhaps, be learned by careful observation. Following are a few instances where ore-shoots terminate upon reaching a gulch or depression crossing the strike of the lode or vein: the ore-shoots of the Kennedy mine do not extend north of the gulch crossing the Lode, north of the north shaft of that property—this gulch is on a fault line; the ore-shoots worked in the Oneida mine do not extend southerly across the east-west valley crossing that mine; the South Eureka ore-shoot does not cross the shallow gulch that lies between it and the Central Eureka; a surface depression occurs between the Central Eureka and

the famous Badger-Eureka shoot, and the rich Eureka ore-shoot does not cross it, nor does this latter continue north of a low saddle between the Eureka and the Wolverine, north of it. The ore-shoot of the Lincoln mine is terminated on the north by a gulch and on the south by a depression; the payable ore-shoots of the Keystone mine do not cross Amador creek on the north; the extension of the Bunker Hill ore-shoots north and south is limited by gullies crossing the vein; the Plymouth Consolidated ore-shoots occur under a nearly level surface, the principal orebody being under a rounded knoll. The great ore-shoot of the Angels-Lightner-Utica group at Angels does not pass Angels creek on the south; the limitations of the Rawhide mine in Tuolumne county are defined by surface depressions; no ore of consequence occurred in the vein of the Gwin mine at the surface where crossed by a gulch; and the Eagle-Shawmut ore-shoot terminates at a gulch on the south, as determined by considerable exploration at that point. The App-Heslep mines occur on a hill known as Quartz Mountain; the Golden Rule-Jumper ore-shoot is limited by depressions; the Pine Tree mine, in Mariposa county, ends at the Merced river; the Princeton mine also is confined between the crossing of two depressions on the surface; the Yellow Aster hill, in Kern county, California, is cut in two by a gulch, the ore being mostly found on either side of it, but little under it. In the vein of the Home Mining Co., near Rosamond, Kern county, California, are several ore-shoots, each of which is limited by gulches crossing the vein—the formation is rhyolite. The ore-shoot of the McCabe mine, Arizona, ends similarly. These instances are sufficient to make it evident that the theory is one at least worthy of investigation.

W. H. Storms.

San Francisco, January 9.

Proposed New Mining Method.

The Editor:

Sir—I have been rather doubtful about writing further as to the cost of channeling and its possibilities for mining work, because anything I have to offer would be of a negative nature. You will find in *Engineering-Contracting*, in one of the November numbers, a cost statement covering a number of months of channeling work on the New York Barge Canal. I think the cost per square foot of channel cut for about eight months, was 26c.; this is mostly in broken limestone. The contract price for channeling on the Government Canal at Sault Ste. Marie, covering about 85,000 sq. ft., was 30c. per ft. Channeling work has been done in New York City for as low as 17c. per sq. ft. Of course, this is entirely open-cut work under conditions more favorable for the machine than could possibly obtain in mining work. The gravest objection to the use of channelers for driving tunnels, or sinking shafts, is the character of the rock, which in many cases would be too difficult to be cut by such a machine.

Channelers have never been used for quarrying granite. When deep cuts are to be made in granite, the quarry bar and rock-drills are used, drilling a series of holes in a straight line and then broaching the cores between the holes with a special flat bit. This theory of putting in a channeled undercut or shearing cut in a tunnel heading has been advanced a number of times in the engineering press, but I believe has never received a test which showed it to be of practical value. As a means of excavating rock rapidly, channelers can hardly be compared in efficiency with the rock-drill. Their economy would come from the character of the wall-cut which they make, the walls themselves being left smooth and true instead of rough and jagged as in the case of the drilled and blasted working. The material in the walls and behind them is not weakened or shattered by explosives, so that retaining walls are seldom required. It might be that channelers could be used advantageously in large shafts to avoid weakening the walls of the shaft, and to reduce the amount of timbering needed. These machines were used on several different occasions to cut wheel pits at the Niagara Falls power plant. These pits were nearly 200 ft. deep, upward of 300 ft. long, and 21 ft. wide. No timbering was required to hold the walls in place and these were practically vertical, there being an offset of 6 in. on each lift or cut of 6 to 9 ft. in depth. Channelers have also been used to cut the walls of a tunnel bench in railroad work when it was desirable not to shake or jar the roof material in the heading. It seems to me that for the varying conditions of ordinary mining work and the size of the workings, it would be difficult to design a machine working on the channeling principle, which would be small enough, and at the same time powerful enough, to perform the work required of it with the necessary rapidity and economy. A machine known as the 'Post Puncher' is manufactured which is used in coal mines for both undercutting and shearing. It is designed on principles similar to those of the rock-drill and is mounted on a column with provisions for channeling horizontally or vertically, as desired. This machine is not intended to operate in rock, however, nor in any material hard enough to spark when struck by steel. The most reasonable suggestion for a channeling device for tunnel work would be, in my opinion, a type of quarry bar such as is used in one of the great marble quarries. This bar has a standard at each end, so that the bar can be raised or lowered. It carries two or more drills which can drill horizontally, or at any angle. A carriage like this may be made in any length and would enable a line of holes to be put in at each side of the heading, across the bottom of the heading next the floor, and at any point or direction desired in the face of the heading. The carriage is on wheels and the whole apparatus can be pulled back out of the way when necessary to blast. The application of such a device would, no doubt, result in the use of smaller quantities of explosives.

S. B. King.

Chicago, December 22.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Copper melts at about 2000° F., a much higher temperature than that necessary to melt most of its ores.

The temperature in deep mines of California's gold belt ranges from 75 to 100° F., the perfection of ventilation being an important factor.

The mines of California have produced since 1848 over $1,600,000,000 in gold. The largest output for a single year was in 1862, when it reached $81,204,873.

Quicksilver is consumed largely in the manufacture of the various kinds of percussion caps, blasting detonators, and similar explosives employing mercury fulminate.

There are few, if any, idle gold mines in California in which there is blocked out immediately available for stoping large bodies of $7 to $10 ore, notwithstanding promoters' reports to the contrary.

Slate deposits are seldom uniformly valuable. Some portions are found cracked, or seamed, or otherwise unserviceable. It is only by development and testing that the value of a slate quarry can be determined.

Few tailing-piles remain in California that can be profitably treated by the cyanide process. Some years ago there were many thousand tons of this material available, but they have mostly long since been treated, some of them two or three times.

Gypsum crystals in the vats at chlorination works are due to the presence of lime in the ore under treatment. The concentrate probably was not wholly free from gangue minerals when sent to the roasting-furnace, and this gangue consisted in part, at least, of lime—probably as carbonate.

Straight pyritic smelting is only possible where the amount of sulphur present is sufficient to make the employment of carbonaceous fuel unnecessary, and it is not always possible even if the desired amount of sulphur be present in the ore unless the ore be self-fluxing or the proper fluxing materials are available.

A simple rule for ascertaining the number of feet board measurement in a piece of square timber of known dimensions, but larger at one end than at the other, like sawed telegraph poles, is: add the area of the two ends to four times the area of the centre section and divide by six. This gives its mean cross-section approximately.

Geysers spouting upon the addition of soap to the geyser basin is due to some cause that is not well understood. At most places where interesting geysers are found, this practice of 'soaping' is strictly prohibited, as it has been ascertained that the remarkable phenomena of geysers is soon terminated if discharged too frequently.

To ascertain the revolutions a driven pulley will make per minute when the diameter and number of revolutions per minute of the driving pulley are known, multiply the diameter in feet or inches of the driving pulley by its number of revolutions per minute and divide by the diameter of the driven pulley in the same terms, feet or inches, as was used for the driving pulley.

A mill or smelter should, wherever possible, be built at some point below the mine, and the ore transported to it rather than to haul all the fuel and supplies of every description up the hill, and pump water to the mill besides. Usually the expense of these operations can readily be arrived at by competent engineers, and if a mistake of this kind is made, there is usually small excuse for it.

Gold ores containing 3 to 20% sulphides may be too low grade to ship or even to concentrate profitably, but may be found to yield the gold to the cyanide process. All such ore should be thoroughly tested by an experienced metallurgist. When this is done it may be discovered that there are many mines that may be operated at a profit, that are at present deemed worthless under existing conditions.

The first cyanide plant erected in Montana was at the Revenue mine in Madison county. It was built by R. R. and F. B. Turner. Many schemes for working this ore had been tried, but without success, plate and pan-amalgamation, and concentration having failed, yet the cyanide process was found particularly adapted to the 'refractory' ore. An ore is only refractory so long as no process is known which will readily treat it successfully.

A miner cannot properly classify a rock—nor can anyone else—until he knows the essential constituents of the rock and is able to identify these constituents. Some insist that a certain rock is syenite when they do not know what minerals must be present to constitute syenite. For the particular edification of such it is stated that typical syenite requires but two minerals, orthoclase (potash feldspar) and hornblende; pyroxene and mica may be present, but these and quartz are not necessary.

Calcite in veins is usually indicative of the presence of lime in some form in the adjacent country-rocks, usually of a lime-bearing feldspar. The mines of Gilpin county, Colorado, contain little calcite, and lime-bearing feldspars are uncommon in that district. In the Mother Lode of California, calcite is of common occurrence, and so also are rocks containing an abundance of soda-lime feldspar, such as oligoclase, labradorite, and other feldspars of the basic rocks of the region. Calcite also occurs in veins in granite, in which case, in the absence of lime-bearing feldspars, it may have been derived from the hornblende or mica present. Calcite in a quartz vein is not indicative of valuable ore, nor is its presence objectionable.

Special Correspondence

MEXICO

Extensive Power Installations. — New Railroad Construction. — The Dry Placers of Altar.

The year has witnessed advances in power transmission to mining districts. The Mexican Light & Power Co. built into the Pachuca district, operating through a subsidiary concern, the Pachuca Light & Power Co. All power demands are being supplied from the great Necaxa plant. The Chapala Hydro-Electric & Irrigation Co., of Guadalajara, completed transmission-lines to the Hostotipaquillo and Etzatlan districts, and will soon start power delivery. The Guanajuato Light & Power Co., which is doubling its capacity by the installation of a third power-plant, on the Angulo river in Michoacan, built a transmission line from Guanajuato to San Luis Potosi, 87 miles. This company is supplying power to the San Felipe camp of Guanajuato, and extensions to the Pinos district of Zacatecas, and the San Pedro district of San Luis Potosi are planned. During the year arrangements were made for the transmission of power from the Copper Queen smelter at Douglas, Arizona, to the Lucky Tiger and other mines in the El Tigre camp of Sonora, and the line will be completed by the middle of 1911. Much has been accomplished by the Mexican Northern Power Co., the Canadian concern that plans an important hydro-electric installation on the Conchos river in the State of Chihuahua. A 17-mile railroad, from Santa Rosalia to the damsite, was completed a few months ago. The company contemplates transmitting power to Parral, Santa Barbara, Naica, Santa Eulalia, and other Chihuahua camps. The Mayo River Power & Land Co., a Denver concern that has ambitious plans for extensive power development and transmission along the west coast of Mexico, announced recently that funds had been raised for a power plant on the Mayo river, in the State of Sonora. Markets for power exist in Sonora and western Chihuahua camps. The Balsas Power & Irrigation Co. was organized some months ago to work under concessions covering the waters of the Balsas river. English and German capital is said to be interested. Late in the year the Durango government entered into a contract with Enrique Schoendube for the utilization of water-power in the northwestern part of that State. Transmission of current to the Indé, Guanaceví, and other Durango districts is planned.

Only a limited amount of railroad building was done in Mexico in 1910. The Mexico Northwestern railway has steadily pushed work on its connecting link from Terrazas to Madera, in the State of Chihuahua, and has practically completed a 25-kilometre branch in to the Cusihuiriachic mining district. The National Railways of Mexico built a branch into the Taviche district of the State of Oaxaca, and has commenced the construction of another to Tlacolula, in the same State. Good progress has been made in the building of the 105-kilometre line from Durango west to Llano Grande. In November the construction of a line through the State of Michoacan, starting from Penjamo, on the Guadalajara division, was commenced. This new merger system feeder will extend to Ajuno, on the Acambaro-Uruapan line. The work of the Southern Pacific has been confined to the Territory of Tepic, and its west coast line is being extended to the Tepic capital. During the year the Southern Pacific secured a concession for a line from Guadalajara to Mexico City, and arranged five and ten-year extensions of all pending concessions. Some work has been done by the Kansas City, Mexico & Orient toward closing its gaps in Mexico. Work on the Honey railroad, to extend from Pachuca to Zimapan, has been pushed. Plans made during the past year promise railroad construction of importance to the mining industry during 1911. A line of importance to Zacatecas and Durango mining districts, that will be built by the National Railways, is one projected for several years from Gutierrez, on the Mexican Central in Zacatecas, to the Durango capital. It is expected to add fully 2000 kilometres to the merger system within the next few years. Surveys for the Arizona, Mexico & Gulf of California railroad, which will cross the Altar district of Sonora from Sasabe to Port Lobos, have been completed. The Torres-Represo mineral railroad in Sonora, purchased during the year by the Mexican Union Railway Co. of London, is to be extended to open several mining sections.

The dry placers of the Altar district of Sonora have attracted much attention during the last year. Following news of success in treating the cemented gravel of the district in a crushing and pulverizing machine invented by Mitts Quenner, a Nogales miner, many placer denouncements were made. Several Quenner plants have been installed in the district, and others have been ordered. An automobile road has been built from Nogales to Altar. The Mines Company of America, operating at La Colorado, Sonora, effected a merger during the year with the Dolores Mines Co. and El Rayo Mines Co., both of Chihuahua, and the capital was raised to $9,000,000. The three concerns jointly purchased the La Dura mines and concentrating plant, in the Yaqui river section of Sonora. The Cananea Consolidated Copper Co. continued its improvement program during 1910. A second reverberatory furnace was added to the smelting plant, and six additional McDougall roasting-furnaces ordered. The improvements made and those yet to be made will total in cost fully ₱7,500,000. The Lucky Tiger Gold Mining Co. is doubling the capacity of its concentrating plant and building a large cyanide plant at El Tigre. Aerial tramways to carry tailing to storage ground were installed by the Moctezuma Copper Co. The development of the San Antonio copper properties in the Ures district by the San Antonio Copper Co. (Cole-Ryan) was carried on steadily. The workings aggregate over 30,000 ft., and a big tonnage has been proved. The Sonora Copper Co. is erecting a 100-ton smelter, and smelters have been ordered by the Chicago Exploration Co., Triunfo Mining Co., and West Coast Mining & Development Co. Several Sonora concerns established concentrating and cyaniding plants in 1910. Much diamond-drilling was done by the Transvaal Copper Co. The Ryall exploration concession expired in April, and approximately 1,500,000 acres were opened to denouncement. A great deal of copper ground in the Piedras Verdes division of the Alamos district was taken up by Seeley W. Mudd, the Lewisohns, and other American interests. In Parral district, two very complete cyanide plants have been built, one by the Palmilla Milling Co. and the other by the Veta Colorado Mining & Milling Co. Each plant will handle 300 tons daily. Late in the year the Palmilla company and the Alvarado Consolidated Mines Co. were merged into the Alvarado Mining & Milling Co. Control of the properties of the Hidalgo Mining Co., in Parral district, including the Parral & Durango railroad, was purchased by persons represented by A. J. McQuatters for $1,500,000. During the year the Exploration Co., Ltd., of London, invested more than ₱1,000,000 in the purchase of the mines of the Santa Eulalia Exploration Co., and the San Gregorio y Anexas and Esmeralda Anexas properties, all in the Santa Eulalia district. The Rio Tinto Copper Co., operating in the Terrazas camp, increased the capacity of its smelter to 600 tons daily, and installed a converter. The San Francisco del Oro Co., of London, operating near Santa Barbara, has started the erection of a 300-ton plant for the treatment of lead-zinc ores, and at the old Rosario mines at Guadalupe y Calvo the West Mexican Mines, Ltd., another London concern, is working on the first unit of a 500-ton cyanide plant. Much development has been carried on during the year by the Sierra Consolidated Mines Co., which took over the Ocampo properties of the Greene Gold-Silver Co. A concession for a hydro-electric plant has been secured. The Plomosas zinc mines of Jose Lago were purchased by French investors. The Dolores, Batopilas, El Rayo, and Rio Plata companies have continued to produce during the year. Heavy production of silver-lead ores was maintained in

the Santa Eulalia district in 1910. The compañia Minera de Naica abandoned its plan for a ₱1,000,000 smelter at Concho station, signing a contract with the Torreon smelter people for its output. English and Canadian capital entered the old Cusihuiriachic district.

The four big concerns of the El Oro district—Dos Estrellas, Esperanza, El Oro Mining & Railway, and Mexico Mines of El Oro—continued a large production in 1910. Dos Estrellas started the year with a dividend payment of ₱1 per share monthly on its 300,000 shares, and later increased it to ₱1.50. The quarterly dividend disbursement in October was ₱1,350,000. Esperanza averaged over $180,000 in production in the first nine months of the year. The average of El Oro Mining & Railway in the first ten months was over $200,000, and of Mexico Mines over $125,000. The Quimica y Anexas mines in the Suitepec district, State of Mexico, were taken under option by the Exploration Co., Ltd., of London. The Seguranza Mining Co., Zacualpan district, added a cyanide plant to its 100-ton mill and concentrating plant. French capital became interested in several promising El Oro properties. The Pachuca district of Hidalgo increased its silver production in 1910, and much was accomplished there in an industrial way. The Real del Monte y Pachuca Co. increased the capacity of its Loreto plant from 400 to 700 tons, and is raising the capacity of its Guerrero plant from 350 to 650 tons. La Blanca y Anexas completed a 300-ton cyanide plant, and San Rafael y Anexas increased the equipment at its new plant. Good progress has been made in the erection of a 600-ton plant for Santa Gertrudis, S. A. (Camp Bird), and a 200-ton plant is being completed by the Guadalupe-Fresnillo. The Santa Gertrudis, South, a strong English company, has taken over mines just south of the Santa Gertrudis, and the Santa Inez Carretera, of Pachuca, has started the development of properties east of La Blanca and Santa Gertrudis. English investors have contracted to buy the Cinco Señores. The construction of a railroad that will connect Pachuca, Real del Monte, and El Chico has been commenced. At El Chico a 100-ton custom plant is to be built by a Pachuca company. The production of the Guanajuato district in 1910 has been at a rate of over ₱1,000,000 monthly. The Providencia Mining & Milling Co. is completing a 40-stamp concentrating and cyaniding plant, and the Tula Mining Co. a 10-stamp plant of the same kind. Early in the year the mines and 300-ton plant of the Guanajuato Amalgamated company were taken over by the Oro Grande Mines Co. The Mineral Development Co. sank its Nueva Luz shaft to a depth of over 600 metres, and is now running a cross-cut to intersect the mother lode of Guanajuato. The old Cinco Minas, in the Hostotipaquillo district of the State of Jalisco, were purchased early in the year by people representing the Marcus Daly estate for ₱500,000. Several months ago the old Bolaños mines in the Bolaños district were taken over by the Bradbury interests of Los Angeles, California. The Ampara Mining Co., Etzatlan, has paid quarterly dividends of 3% on a little more than $2,000,000. The year will show a production of over ₱1,500,000. El Favor Mining Co. has a 20-stamp concentrating and cyaniding plant ready to be operated as soon as power reaches the Hostotipaquillo district. The Consolidated Mining Co. has been steadily developing and shipping during the year, and is assembling equipment for a reduction plant. The old Amajac reduction works in this district have been remodeled for custom work. French capitalists have become interested in Magistral-Ameca Copper Co., and its concentrating plant in the Ameca district is to be enlarged. During the year the Peñoles Mining Co., of Mapimi, State of Durango, purchased control of the San Juan Mining Co., of the same district. The Velardeña custom smelter of the American Smelters Securities Co. had a successful year. A number of Durango properties contributed ore supplies. In Zacatecas the old mines of the Cerro de Proaño were taken over by the Robt. S. Towne interests, and the Proaño Mining Co. has been formed to build a cyanide plant. A concentrating and cyaniding plant has been completed by the Zacatecas Mining & Metallurgical Co. at the San Cristobal mines in the Zacatecas district. A 50-ton custom reduction plant was built at the Zacatecas capital by a company in which the Zacatecas government is interested. In Sinaloa a 180-ton reduction plant was built by the Palmarito Mining Co., 15 miles from Casal station. Arrangements have been made by the San Lorenzo Mining & Smelting Co. for the erection of a 100-ton smelter in the San Lorenzo district of Sinaloa. The Copala mines, of the Butters Copala Syndicate, in Sinaloa, were shut down a few months ago. The Metates mines were purchased by Los Angeles men for $125,000. The option at ₱20,000,000 of the Exploration Syndicate, Ltd., of London, on the properties of the Reforma Mining & Milling Co. at Campo Morado, State of Guerrero, was surrendered. It is said that an offer of ₱13,000,000 was made and refused. The year has seen some activity in the old Taxco district of Guerrero. The rich San Juan mine in the Taviche district of Oaxaca was returned to the San Juan Mining Co., an American concern, by a decision of the Supreme Court of Mexico. Through legal action in a State court, the mine had been taken from the Americans by Juan Baigts, the former Mexican owner.

Pachuca, Mexico.

LONDON

Mechanical Devices for Diamond Deposits.—Gold Mining in Brazil.—The Mount Elliott Copper Mine, North Queensland.

The portable hand-jigs that are being sent to German Southwest Africa from the Humboldt works at Cologne for the purpose of prospecting and working the diamond deposits there, have served to attract interest once more to the mechanical methods of treating deposits containing precious stones. I suppose I am writing on a subject of no great interest in the United States. Literature relating to the recovery of diamonds and other precious stones from gravels or from clayey matrix is scanty, chiefly because, with the exception of the plant at the big mines in South Africa, no elaborate machinery has been used. At these mines the disintegrated earth, together with water, is passed through pans for the removal of slime and fine sand which constitute nearly 99% of the total, and the remaining portion is treated in jigs having coarse fixed screens bedded with lead and iron shot. The precious stones are recovered in the hutch product, and are afterward picked out by hand and caught on greasy tables. These installations are, however, only suitable for work on a large scale, and the design is of little use to the engineer who wishes to test a gravel or other deposit, or to an operator who desires something better than the native pans. The pioneer companies in German Southwest Africa have adopted jigs based on the principle of the oscillating sieve on which the diamonds and other heavy stones are deposited. Some of these jigs are adapted for hand labor and others are driven by power, but the notable feature is that they are either mounted on wheels, or can

be carried on wheeled trucks so as to be easily moved from place to place, or follow the particular deposit under treatment. The sieve is moved by a cam which causes a rapid downward motion and a slow return. The earth, after the removal of the slime and fine sand, is shoveled into a hopper and the waste is removed by a small bucket-elevator which is operated from the driving-shaft. The throw of the sieve can be adjusted according to the size of the material. If the machine is larger, or if there are many side by side, a petrol motor is used for driving; and if the work is on a large scale, the trommels, in addition to removing the finer portions, divide the coarser parts into three or four sizes to be treated by different machines. In these cases each jig is made with two compartments. It is the practice to use salt water in the jigs, as its higher specific gravity helps the separation of the diamonds, and the ironwork is given a coat of protective paint. The concentrate is removed usually once every day or two from the sieve, and this is done by the confidential man. The jig is covered at ordinary times so that no one else can gain access to the sieve. The concentrate thus obtained is found in layers of different sizes, and in removal from the sieve these sizes are kept separate. A further concentration is done by the confidential man in a small hand-jig.

There are two English companies working Brazilian gold mines on a large scale, both of them old-established businesses. There are many drawbacks incident to work in that country; the jealous attitude of the Government and the fluctuation in exchange are not the least of these. One of these mines is the deepest in the world. This is the St. John Del Rey, which started work as long ago as 1830. The orebody dips flatly and the lowest level is 4000 ft. vertically below the adit. The upper parts have caved, and operations are now conducted through vertical shafts which cut the orebody at the eighth level. Below this, hauling is done through a succession of vertical shafts and levels, necessarily adding to the cost, but unavoidable owing to the nature of the work to be done. During the six months ended August 31, 94,504 long tons of ore was mined, and 92,400 tons was sent to the 120-stamp mill. The total gold extracted by amalgamation and cyanide was worth £204,659, or 44s. 2d. per ton, of which 30s. 2d. per ton was obtained by amalgamation, and 14s. per ton by cyanide. The average assay value of the ore was 2s. lower than during the previous twelve months, but the ratio of extraction (93½%) being slightly higher, the extraction was only 1s. 7d. per ton less. As a set-off, the plant treated more ore, so that compared with the corresponding six months a year ago, the production of gold showed an increase of £7164. As regards expenditure, the extra cost of steam-power required on account of the failure of the electric supply was £6410, and the rise in the rate of Brazilian exchange added £6300 to the costs; nevertheless, other economies were effected, so that the profit for the half-year, £47,434, was only £1055 less than during the corresponding period of last year. The working cost in Brazil was £139,850, and £6063 was spent on development. Taxes in Brazil and London absorbed £11,119, and London expenses £1781. Debenture holders received £2712, preference shares £5292, and ordinary shares £19,271, being 8d. per share. The balance, £18,571, was transferred to capital account for new works. During the half-year an additional 10 stamps were erected, and the 120 stamps will be gradually overhauled without the output being curtailed. The Peixe hydro-electric station is well advanced, and 1000 hp. will be available from this source before long. The other company, the Ouro Preto Gold Mines of Brazil, was formed in 1884 to acquire the Passagem and adjoining mines in Minas Geraes, only a few miles from the St. John Del Rey. The management is in the hands of John Taylor & Sons, and A. J. Bensusan is the superintendent. The capital of the company is 100,000 ordinary shares, and 36,634 preference shares entitled to a 10% cumulative dividend. The preference dividend has been paid up to date, but the ordinary shares have only received 17½% since 1893. During the year ended June 30, 75,612 tons of ore yielded gold valued at £108,773, equal to a recovery of 7 dwt. per ton. The total expenses, including £3712 paid as tax on the export of gold, were £94,435, leaving a profit for the year of £15,814. Out of this, £8135 has been allowed for depreciation, £3663 has been paid as preference dividend, and a dividend of 2½% has been paid on the ordinary shares absorbing £2500. Owing to influx of water the amount of development has been curtailed, and the reserve on June 30 was 169,991 tons as compared with 202,030 tons a year ago. During the year an electrical pumping plant has been erected and the water in the mine is now fully under control. The Maquine and Santa Anna properties, situated three miles away from Passagem, have been let under option on favorable terms. These mines were purchased ten years ago and previously had produced large amounts of gold.

The Mount Elliott company was formed in London in 1907 to acquire the Mount Elliott copper mine, 72 miles south of Cloncurry, North Queensland. Eighteen months ago W. H. Corbould, the new manager, expressed his disapproval of the cramped position of the smelting works and decided to transfer the plant to a more convenient spot. The old smelter ceased work at the end of July last year, and the new plant was put in operation on September 1 of this year. Since the new plant began operating, the monthly reports for September and October show 9095 tons of ore smelted and 1085 tons of blister copper produced, containing 1803 oz. gold and 1249 oz. silver. The amount of development work done recently has not been great; it was considered better to concentrate operations on the reconstruction of the smelting plant, seeing that the ore reserve was substantial, amounting to 140,000 tons, averaging 10 to 12% copper, and 300,000 tons averaging 3%, all above the fourth level. Mr. Corbould prefers not to give estimates of any ore below this level, as the ore is of a different character from the lens of high-grade ore which has been worked so far. He considers the rich ore to be secondary, and the primary ore, of which there is evidence of large quantities, has to be developed and estimated from a different standpoint.

JOHANNESBURG, TRANSVAAL

Gold Output.— Deep Boring Continued. — Improvement in New Diamond Mining Affairs.

Although the gold mines of the Transvaal are still suffering from shortage of native labor, and despite the fact that over 2000 natives were lost to the gold industry during October, the output for that month made a new record. The total yield for the Transvaal province has been declared by the Chamber of Mines to be 653,147 oz. of fine gold, of a value of £2,774,390. This is £31,845 below the highest declaration ever announced by the Chamber (namely, for December 1908), but it should be pointed out that the output for the month was largely augmented by quantities of accumulated gold, and that if these accumulations are not reckoned in the comparison, the October output is a record by nearly 4000 fine ounces. In comparison with the preceding month of September, which had one less working day, the increase amounts to 6248 oz., or £26,537. Of the total return, the Rand contributed £2,665,216, the remaining £109,174 being produced in the Heidelberg, Barberton, Lydenburg, and Klerksdorp districts. Several of the Main Reef companies record substantial advances in output. Both of the leading producers, the East Rand Proprietary and the Crown Mines, which between them produced close on to half a million sterling during the month, record improvements. The East Rand Proprietary's return was £4388 higher at £264,629, and the Crown Mines output £5607 greater at £228,014. The largest increase for the month was declared by the Randfontein South company, where the output was £138,939, as compared with £133,239 declared for the September operations. Among the decreases the most noticeable is that of the Bantjes—£9672. A note issued by the head office states that owing to shortage of labor 2487 tons of ore from the dump was crushed. The Simmer & Jack company also announces a decrease amounting to £3522. Profits of several mines have been

much affected by labor shortage. The Durban Roodepoort Deep, Main Reef West, and Bantjes companies have suffered especially in this regard, and at one or two other mines abnormal conditions have affected the earnings. For instance, at the Ferreira Deep, the necessity of cleaning out low-grade ore from stopes preparatory to sand-filling resulted in a decreased recovery per ton, and also brought about abnormal working expenditure. At the Roodepoort United Main Reef mine, where a new plant is being started up, mining and milling conditions are not yet normal, and the tonnage milled during October included 7200 tons of low-grade dump rock. The profits earned by the principal groups declared in respect of last month's operations are as follows: H. Eckstein & Co. Rand Mines, £218,038; other subsidiaries, £188,973; Farrar-Anglo-French group, £127,094; Consolidated Gold Fields, £113,525; S. Neumann & Co., £70,241; Albu group, £56,884; Barnato group, £54,281; Goerz group, £23,656.

Boring operations continue on the properties of the New Rand company. The objects of this venture are the location and exploitation of the 'southern auriferous beds of the Main Reef series', and the whole structure of program and policy has been built up on a foundation which can only be described as presumptive in the extreme, namely, that at present Rand is but the northern counterpart or just one edge of a basin or trough, the southern rim of which lies in the vicinity of the Vaal river. It is with a view to locating this southern rim that extensive diamond-drilling operations have been carried on in the southern portion of the Transvaal and the northern area of the Orange Free State for some few years past, first under the auspices of the now defunct Orangia Main Reef Co. and later by the New Rand, Ltd., under the direction of A. R. Sawyer, an English mining engineer who has had many years experience in South Africa. From an economic point of view, the diamond-drills do not appear to have established much as yet, but the cores brought up have indicated ore of some value and have been of interest from a geological point of view. The investigation is based on geologic correlations, and the disclosures warrant a hope that some relations of much value may be established as between the New Rand company's sphere of operations and the Main Reef beds. More than this can scarcely be said at present. The venture is a highly speculative one, but the possibilities of reaping an immense reward have induced people to provide further funds for deep boring, and in the past three and three-quarters years nearly 21,000 ft. have been drilled. At the present time operations are being concentrated on the No. 13 bore-hole which is now at a depth of 1400 ft. or more. In a report recently issued by the company's consulting engineer, considerable stress is laid on the analyses of two sections of core from the No. 12 bore-hole, one being a piece of diabase and the other magnetic slate, the former being drawn from a depth of 898 ft., and the latter from 1076 ft. Qualitative and quantitative analyses have shown the presence in the diabase of small quantities of copper and traces of nickel and gold. The magnetic slate contains, among other elements, 12 gr. gold and traces of silver and nickel per ton. The crux of the whole question is: assuming the establishment of definite correlative values as between the West Rand proper and the New Rand company's area, what are the premises for believing that gold will occur in the latter in similar quantities as are found in the Main Reef beds? After all, a satisfactory assay plan is of far more value than whole volumes of correlative geology—a branch of science which has, if anything, been much overdone in South Africa.

There has been a distinct improvement in the affairs of the Roberts Victor Diamond Mining Co., which owns and is exploiting an occurrence situated near Boshof in the Orange Free State. Three or four years ago this company was one producing diamonds in considerable quantities, and the shares at one time stood at a premium of £14. The output of the mine for 1907 was 132,809 carats from 251,963 loads washed, or 52 carats per 100 loads—a high-grade return. Last year a serious contraction was found to occur in the central area of the No. 3 mine, and, owing to a large fall of reef, washing from the open ground was stopped in July 1909, pending development of the lower levels from the shaft. Extensive prospecting was then carried out, but for some time without result. Within the past four weeks, however, a discovery of much importance has been made, and the price of the shares has improved by about 150% in consequence. Bore-holes have proved 'yellow ground' to the southwest of the old workings covering a fresh area of at least 70 claims. The 'yellow' is stated to contain good deposits and the prospect is encouraging. Further exploration work is being carried out and, because of the likelihood of a new and extensive diamond-bearing area being proved, and also on account of improvement in the diamond market, the outlook for the Roberts Victor company is better than it has been for a long while.

KALGOORLIE, WESTERN AUSTRALIA

October Production. — Dividends Paid. — Bullfinch Stampede.— The Metallurgical Problems.

The October gold yield from the State was valued at $2,600,000, and dividends paid totaled $450,000. Returns from the chief producers were as given below:

Name.	Tonnage.	Yield.	Profit.
Associated	10,330	$ 75,000	$ 24,000
Associated Northern	2,445	23,500	10,000
Bullfinch	135	56,000	.....
Chaffers	4,340	28,500	20
Golden Horseshoe	23,908	165,000	350
Golden Ridge	2,460	32,500	14,900
Great Boulder Perseverance	20,131	129,000	22,000
Great Boulder Proprietary	18,497	248,000	125,000
Great Fingall	10,416	81,500	13,500
Hainault	5,580	36,000	5,000
Ivanhoe	19,501	206,500	100,000
Kalgurli	10,825	138,000	73,000
Lake View and Star	12,878	73,000	20,000
Oroya-Black Range	4,530	45,000	9,500
Oroya Exploration	21,904	27,000	15,000
Oroya Links	7,367	41,000	5,000
Sons of Gwalia	13,511	118,000	44,000
Sons of Gwalia South	2,308	21,000	6,500
South Kalgurli	9,212	61,000	10,000

The properties which paid dividends for September were the following: Golden Ridge, $34,500; Great Boulder Perseverance, $325,000; Sons of Gwalia, $107,000. Those paid for October were: Ivanhoe, $250,000; Kalgurli, $185,000;

The Bullfinch, Western Australia.

Sons of Gwalia South, $17,500. The Perseverance comes out with a record tonnage since the mine started crushing.

During the past fortnight the Bullfinch boom continued. Every day rich ore was unearthed anywhere between Southern Cross and Golden Valley, a distance of some 30 miles. Then there would be a wild rush to peg leases. (Leases here contain 24 acres each.) The Mining Registrar has received $15,000 as deposits on leases, and about 12,000 acres have been pegged. Men who had pegged then sat down and waited for 'experts' to examine their claims.

and arrange terms for an option. Anything within a few miles of the Bullfinch was sufficient for a large deposit on an option. The country has been flooded with prospectuses. There have been many flotations of companies in Western Australia, Adelaide, and Melbourne to work leases that had not yet been granted by the Mining Warden. Shares rose to absurd prices. Practically no work is being done on any of the leases. The Government surveyed a townsite—to be named Bullfinch—about a mile from the parent mine. The blocks were put up for auction with the provision that no licenses to sell liquor would be granted, the Government intending to erect a State Hotel similar to that at the Sons of Gwalia. The town blocks brought from $1000 to $4000 each, the total from 57 blocks realizing $125,000. Being 25 miles from the telegraph line, great delays occurred in business, so the Federal Government is running out a wire to Bullfinch. Water being scarce for the big population on the new field, the Western Australian Government is laying a temporary 3-in. pipe at a cost of $40,000, to connect with the Kalgoorlie water system. On account of the great inconvenience and cost to travelers, and the probable large amount of freight to be carried later on, a bill to construct a railway to the new field has passed Parliament after much discussion, as it seems to be rather premature. The Bullfinch has been floated with 500,000 $5 shares, the owners, Doolette, Shallcross, and Jones, taking 400,000 shares; 50,000 were offered to the public and 50,000 kept in reserve. Shares now stand at $14. The flotation cost practically nothing. The company has engaged C. Jibson, of the Western Australian Government, as member of its staff. The main shaft is to be deepened to 200 ft. Development work results in showing good ore, and the extent of the deposit—some people term it so—has not been determined, much to the chagrin of owners of adjacent leases. Treatment at the Recovery company's works continues, and the average value is about $440 per ton. The ironstone ore is being roasted, while the quartz is being treated by ordinary milling methods.

Apart from the Bullfinch, there have been other wild rushes; one of the most amusing being one 6 miles west of Kalgoorlie, where a few $10 crushings have been taken out of late. Another rush set in at Kunanalling, some distance north of Coolgardie, where specimen ore was found. There have been others, and no doubt these people did not wish the Bullfinch district to have all the money that appears to be fairly loose just now. The treatment of the Bullfinch ore, assaying from $120 to $440 per ton by our ordinary treatment here, rather explodes the old theory that high-grade ore should be shipped to smelters for the best results. The treatment of rich telluride ores in our mills is successful. The cost of shipping ore in the earlier days of this field ran up to $28 per ton, when it could have been done locally for $5, and at present for $2.50, per ton. Some interesting work was done last month at the Associated Northern mill, in treating a lot of concentrate containing over 20% arsenical pyrite, from the Transvaal mine, near Southern Cross. A Merton furnace was set aside for this ore, and it roasted the mineral at a rate of 9 tons per day. Directly it was fed into the furnace it started to burn strongly, little fuel being used. An excellent roast was obtained, and the roasted product was discharged into the conveyor that carried the company's own ore from the other five Mertons. S. Roberts, the metallurgist, informs me that the extraction was only affected to the extent of a drop from 93 to 90%. There being only about 40 tons in the lot, no attempt was made to save the arsenic. No fume was noticeable about the furnace. A very interesting point to notice was the tremendous quantity of white fume emitted from the 100 by 6-ft. stack. The fume was dissipated over the surrounding leases, but no complaints were made. The Kalgurli reports highly payable ore at 1650 ft., and the Ivanhoe is meeting with much encouragement in the winze below 2270 ft. As the ore reserves have been depleted and the value of the ore has steadily decreased the mining and metallurgical methods have been improved to meet the loss.

BUTTE, MONTANA

Interesting Data Concerning the Ophir. — A. H. Wethey Retires from the Clark Properties.—The Tuolumne-Anaconda Output.—Railroad to Georgetown.

The Butte Central Copper Co. is doing effective work in the Ophir mine, and by the time the new concentrator is ready next spring there will be an abundance of ore accessible. The work is confined to the 300 and 500-ft. levels, the drifts having been extended eastward from the main cross-cut 400 ft. On the upper levels are two veins, but on the 500-ft. there is evidence of juncture of the two veins, the country between them being well mineralized. Driving is in progress on the hanging wall of the south vein, and on the foot-wall of the north vein. An orebody 8 ft. wide is being opened on the latter, and on the south wall there is 10 ft. of shipping ore. This ore assays from $5 to $40 per ton. The drifts will be extended to the east boundary of the Ophir claim, and probably within 200 ft. the Rarus vein will be opened. This fault-vein, one of the two cross-fissures in the district, has been highly productive of copper ore at places where it intersects the east and west veins. The other cross-fissure is known as the Blue vein. It strikes through the district in a northwest and southeast direction. The Rarus fault runs northeast and southwest—goes through the Rarus, Tramway, Pennsylvania, and Belmont groups, in which some of the greatest orebodies in the district are being mined. The apex of the Rarus fault is traced southwest to the eastern end-line of the Ophir, and in its descent it dips to the west, so that it is believed it will first appear in the Ophir ground on the 500-ft. level. The Ophir has another smaller fault-fissure vein having a northwest-southeast strike, and it is the opinion of W. L. Creden, consulting engineer of the Butte Central, that this fault and that of the Rarus united in the Ohpir at a depth of 1000 to 1200 ft., and at the intersection large copper deposits will be found. The future development of the Ophir will be in following out that theory.

The retirement of A. H. Wethey, as general manager for the Clark interests, on the closing day of the year, was the occasion of a banquet tendered him at the Country Club by his associates, at which Mr. Wethey made a notable speech, reviewing the great growth of the city in the last 23 years. He also took occasion to refer to the decline of Butte as a smelter centre in the past few years. He spoke of the Pittsmont as the only smelter left; it belongs to the East Butte company, which treats its own ore and that from two or three small mines. He spoke of the development of the zinc industry in this district, and said that in the sale of the Butte Reduction Works to the Anaconda company, W. A. Clark had reserved the privilege of concentrating zinc ores there until December 31, 1913. Mr. Wethey stated that over 400 tons of zinc ore per day were being concentrated at those works, the product amounting to 125 tons of 50% zinc concentrate, shipped to the zinc-smelting plant at Bartlesville, Oklahoma. Mr. Wethey and his family will now make their home in New York. He has purchased bronze manufacturing works in New Jersey, to which he will give his personal attention.

The Tuolumne company declared a 15% dividend at the last meeting of the directors. The sum thus disbursed amounts to $120,000. The company is shipping 250 tons per day of ore which samples about 10% copper, and is sinking and developing. The original intention was to sink to a depth of 2000 ft., and it is possible that the shaft may be sunk 200 ft. below that. The latest advices are that the new steel head-frame, hoist, and other equipment will be put in position in May. The production of copper by the Anaconda company for December amounted to 21,500,000 lb., of which 15,900,000 lb. was turned out by the Washoe smelter, and 5,600,000 lb. by the Great Falls smelter. In the production of the Washoe smelter is included the output of the Tuolumne and North Butte companies. In addition to the output of those two smelters, about 1,000,000 lb. was produced at the East Butte plant.

A body of rich ore has been opened in the mine of the Corbin Metals Co. at Corbin. The ore was found by driving from the 500-ft. station in the shaft. It consists of a 5-ft. vein, the ore assaying 20% lead, 2½% copper, 12% zinc, and 14 oz. silver per ton. An effort is being made to extend the tracks of the Butte, Anaconda & Pacific railway from Anaconda to the Cable and Georgetown, so that the ores of that district may be moved direct to the Washoe smelter. The length of the branch required would be 12 to 15 miles.

NEW YORK

The Calumet & Hecla Merger, and the Apportionment of Shares of the New Company.—Comment on Granby.— Extension of Jerome Area.—The International Smelter.

The year of 1910 held much in promise and yielded much in disappointment so far as mining markets go. Coppers have grown in public favor, but the situation in copper has not cleared as rapidly as expected. The development of each large property makes more apparent the necessity for effective action; and, possibly the most encouraging feature is the frank recognition of the necessity for the control of production; and the longest step toward the eventful merging of interests is the recently announced consolidation of the copper properties controlled by the Calumet & Hecla. A new corporation, to be known as the Calumet & Hecla Mining Co., is to be formed with a capital of $10,000,000, divided into 400,000 shares of a par value of $25. Given below are the names of the companies absorbed in the merger, and the basis of exchange agreed upon.

	Present share issue.	Allotment of new shares.	Rate per 100 shares old for new.
Calumet & Hecla...	100,000	240,000	240
Osceola	96,150	48,075	50
Tamarack	60,000	13,200	22
Ahmeek	50,000	40,000	80
Superior	100,000	18,000	18
Isle Royale	150,000	10,500	7
Centennial	90,000	5,400	6
Allouez	100,000	17,000	17
La Salle	302,977	6,059	2
Seneca	20,000	6,000	30
Laurium	40,000	4,000	10
Gratiot	100,000	500	0.5

The total outstanding stock of the new Calumet & Hecla company will be 337,393 shares. The present move has caused much discussion concerning the past history of the company. It has been but a short time since the great producer of the lake region stood alone in the leadership of the copper world. As a deep-level mine it is probably without an equal. In making comparisons therefore with any of the newer properties it is natural to consider Utah Copper as the leader of the porphyry group and as presenting the most complete contrast in mining methods. The output of the Calumet & Hecla for 1910 was 72,108,000 lb., as against 122,000,000 lb. produced by the Utah Copper. Copper costs were 8.43c., as against Utah's 8c. The average market price in 1910 for the Calumet & Hecla property on its $2,500,000 capitalization was $54,000,000, while Utah Copper has $15,400,000 stock out, the average market price on which in 1910 gave the Utah a valuation of $69,000,000. More important, perhaps, is the parallel in dividends, the Michigan property disbursing $2,900,000, Utah Copper $4,667,000; and of still greater importance is the fact that the Lake company is about at its limit of production in turning out 70,000,000 to 72,000,000 lb. per annum, while Utah will probably output 150,000,000 lb. per annum. While this move of the Calumet is taken to mean a preliminary getting into line for further consolidation of the great coppers, the fact remains that the next six months will test many of the producers. It is admitted on all sides that dividend reductions must follow if the producers are asked to curtail, and at the same time take lower prices for metal. Anaconda, Utah Copper, and Nevada Con. are earning more than a safe surplus above dividend requirements. The Granby statement was rather disappointing. The shareholders and the public had hoped that a policy of publicity would be inaugurated, but the report was carefully noncomittal. Diamond-drill operations are stated to "have disclosed a considerable body of ore," which is not explicit, and as the future of the property is dependent upon the results of exploratory work the matter is one in which the stockholder is vitally interested and of which he deserves to be informed. The Granby management seems not to have profited by the sensational performance of some months ago. However, in the endeavor to secure some profitable ores for the reduction plant, the management recently obtained an option on the Cliff Con. and St. Elmo, at Rossland. Utah Con., which recently had a decline almost equal to that of the Granby, is holding well around 13, from which it is evident that there are some friends of the property who think Channing and Berger were too pessimistic in their estimate of the property's future. The International Smelting & Refining Co.'s plant at Tooele is declared to be unaffected by the conditions at the Utah Consolidated. Contracts are stated to have been secured from various mines in Utah, Nevada, and Idaho which will keep the plant running at its capacity during the current year. The plant has been in operation for four months and the management states that every detail is working smoothly. The developments at Jerome, Arizona, are attracting some attention. The United Verde Extension is enlisting some Eastern support and begins to look as though it would make more than a one-mine camp of Jerome. The company now states that it has $50,000 as a development fund in the treasury, which will carry it through the current year, and the issue is being compared with some of the other low-priced coppers, such as First National, Davis Daly, and Ohio. Not all of the various copper consolidations are viewed with equanimity by the shareholders. Calumet & Hecla registered a decline of $30 per share on the publication of the news of reorganization. There is great dissatisfaction among the shareholders of the Butte Coalition on account of the terms upon which the property was turned over to the Anaconda, especially in view of the rich orebodies now being exposed, and stockholder's protective committees are being freely talked of. There is beginning to be some activity in Porcupine, while there is little known regarding the specific properties, the incorporation of the Hollinger has made a starting point and Porcupine stocks are being quoted on the Toronto Exchange.

SALT LAKE, UTAH

Comment on the Estimates of Utah Con. Ore Reserves. — Bingham Mary Brings Suit Against the Utah-Apex.

Some light has been thrown on the wide discrepancy between the recent report on the Utah Consolidated and that issued by the company in its last annual report. The latter was made by J. B. Risque, then manager for the company, and his estimates were practically concurred in by J. W. Finch. Mr. Finch stated that, owing to the limited time allowed him, he was unable to make a complete report from personal inspection and that he plainly stated that his report was largely based on mine records. Mr. Risque states that his report was based on the tonnage reported as developed when he took charge of the property and that he arrived at his figures of developed ore by adding that developed under his management and deducting that which had been shipped. Taking the company's earnings for the present year as a basis, and considering that the cost of tramway construction was included in the operating account, and that for the greater part of the year the ore was subjected to a freight charge of 40c. per ton and an unfavorable smelting contract, there is reason to believe that the price to which the stock has fallen is lower than is justified by actual conditions.

Suit has been filed by the Bingham Mary against the Utah-Apex and request made for an order directing that a survey be made by the Utah-Apex on the ground that the property lines have been transgressed.

General Mining News

ALASKA

(Special Correspondence.)—The Mt. Andrew mine, situated on Prince of Wales Island, is to be opened at a depth of 400 ft. by an adit which is being driven. Mining operations are to continue through the winter, and ore-shipments will be made at regular intervals. Several new orebodies have been discovered on the Jumbo group near Sulzer by means of diamond-drill work. In one instance the drill cut through 120 ft. of ore. A. E. Roberts of New York has been making an examination of this property. The It mine is to have a 1300-ft. adit that will tap the ore at a depth of 400 ft., and drain the workings above it. Another shipment of ore is soon to be sent out from the Rush & Brown mine.

Ketchikan, January 2.

ARIZONA

COCHISE COUNTY

The Lowell shaft of the Copper Queen Co., at Bisbee, which is to be the principal supply-shaft of the group, is being sunk from 1400 to 1600 ft.; at the latter depth a connection is to be made with No. 1 winze.

GILA COUNTY

(Special Correspondence.)—While it was the intention of the Miami Copper Co. to have its concentrator finished and one unit in operation by January 1, 1911, there yet remain so many details to be attended to that it seems improbable that operations will start before February 1. Delays in the shipment of machinery, and the other troubles incidental to the construction of a plant of this size, have been encountered. In the underground workings new timbers have been put in the main drifts, the track laid, and electricians are installing trolley wire on the 420-ft. level. A number of chutes extending from the 'ore-rooms' on the 370-ft. level to the ore-bins on the 420-ft. level have been finished. The initial run of the mill undoubtedly will be made on ore from the dump at No. 4 shaft. Two raises have been made from the 420-ft. level through this dump. Chutes have been placed in the raises and the ore will be passed to the bins and then hoisted to the surface bins. This dump at one time was too low grade to be handled at a profit, but by mixing it with ore of a nigher grade, practically the whole dump can be worked profitably. It is estimated that there is enough ore on this dump to keep the concentrator running for several months, so that no great amount of mining in the main orebody will be necessary for some time. At the pumping-station, two miles from the concentrator, the balance of the electrical equipment has been received, and a force of men is installing it and making all arrangements for the turning on of the water. The company has had 33 churn-drill holes driven to explore ground in the northwestern part of its holdings, the drills having reached an average depth of 600 ft. This work is still in progress. On the claims belonging to the Orphan Copper Co., adjoining the Miami townsite on the west, and contiguous to the ground of the Inspiration and Live Oak companies, preparations are being made to explore the property. C. M. Clark, the manager, has purchased a churn-drill to be used for this purpose. An inclined shaft has been sunk on the eastern end of the claim to a depth of 550 ft.; and about 600 ft. of cross-cutting was done both east and west at this depth, which resulted in finding considerable ore, some of which assayed as high as 8% copper.——The Boston-Miami Copper Co., that owns the group of claims one-half mile west of Miami, did extensive churn-drilling on the southern end of the claims during last winter and spring, and has now moved its camp to the northern end of the property, where drilling is to be commenced soon. It is thought that ore will not be found at a depth of less than 500 ft., this belief being based on the developments of the Live Oak company. The drill-hole nearest to the Boston-Miami line is 200 ft. east, and in this hole ore was found at a depth of 475 ft., and continued down to where drilling was stopped at 700 ft. This exploration work will probably demonstrate to what distance the deposit of low-grade ore extends in a westerly direction.——The recent developments on the property of the Superior & Boston Copper Co. have been the most important for some time. The work on the eighth level in the drift paralleling the Great Eastern vein has resulted in making a favorable showing. Two weeks ago a vein from 6 to 8 in. wide was opened, the ore in which assayed from 4 to 6% copper. During the past week the face of this drift has been in ore, the last round of holes showing the full face of the drift in a rich iron ore containing some copper glance and cuprite. The indications are that with further development this vein will lead to a strong body of ore. The drift in which this ore is being found is directly beneath the place where the high-grade ore was found on the level above.——The Inspiration Copper Co. is sinking at the Joe Bush and Colorado shafts. The Joe Bush is down to 490 ft., and the Colorado has reached a depth of 475 ft., the last few feet in the latter having been in ore. The Joe Bush, Colorado, and Scorpion shafts have all been connected on the lowest level. Most of the development thus far has been in the vicinity of the Bush shaft; but practically nothing has been done in the way of blocking out the ore around the Scorpion and Colorado shafts. In the 75-ton test mill, that was built a short time ago, tests are being made every few days to determine the concentrating quality of the ore, and the kind of machinery that will be best adapted to handle it. Experiments have been made in the last few days with the system introduced by the Utah Copper Co., and the results have been highly satisfactory. The company has increased the number of air-drills by three, making six now at work on the property; four are engaged in blocking out ore, and the other two are being used in doing prospecting work. In drill-hole No. 405, one of the last holes drilled, ore was found that assayed as high as 4% copper.

Globe, January 7.

MARICOPA COUNTY

The Arizona Gold Mines Co. is developing a copper and gold mine on Buckhorn gulch, Castle creek district, southeast of Wickenburg. The work is in the hands of Mark Bradley, who has prospected the cropping by trenches, and is now sinking a 2-compartment shaft, which is to have a depth of 600 feet.

MOHAVE COUNTY

Shipments of zinc sulphide ore from the Golconda mine, Cerbat district, amount to one car per day to zinc smelters in Oklahoma. A part of those shipments constitute zinc concentrate turned out at the mill. Information published at Kingman is to the effect that the United States S. R. & M. Co. has taken an option to purchase the Gold Road mine, and that the United States company's engineers are sampling the mine to determine the extent of ore-reserves, and the value of the ore. The Gold Road and Tom Reed mines have gold-bearing ore which is treated in cyanide plants. The product of a recent two weeks' run of the Tom Reed mill amounted to $70,000, while the weekly output of the Gold Road mill is about $20,000. The cost of mining and milling the Tom Reed ore is reported to be a little less than $4 per ton; that of the Gold Road is but a trifle over $4. Electric power is employed at both plants.

PIMA COUNTY

The Twin Buttes mine, 20 miles out from Tucson, has become a heavy shipper of ore, and the matter of providing smelting facilities is under consideration.

PINAL COUNTY

The development of the Ray Consolidated aggregates over 7000 ft. per month, and incidental to this work there is being mined about 1000 tons of ore per day. The supply of ore accumulated in this way amounts to about 120,000 tons, which will be drawn on for the concentrator, and two sections of that plant are expected to be in operation

in February. The smelting plant construction is in progress, two reverberatory furnaces of which probably will be ready for work in July.

YAVAPAI COUNTY

The Arkansas & Arizona Copper Co., operating in Jerome district, has sunk its shaft to a depth of nearly 800 ft. The Cleopatra Copper Co., mining in the same district, recently shipped two cars of ore to the Humboldt smelter, and it is stated that shipments are to be made regularly. A discovery of ore yielding high returns in copper, gold, and silver was made on the Michaels, Scanlon, and Hatch claims, situated four miles east of Humboldt. A small number of tons sent to the smelter sampled about $1000 per ton.

YUMA COUNTY

The Silent King group of claims, situated in the Shorthorn range, six miles north of the Kofa district, is being developed by Salt Lake men, among whom are W. H. Clark and Llewellyn Humphreys. Considerable development has been done, the result of which is to disclose a wide vein of quartz-porphyry, containing gold in commercial quantity. Hoisting equipment is now to be installed, to enable deeper development to be done. The shaft now has a depth of 140 ft. A stage-line is maintained between Vicksburg and Silent King camp, the latter having a population of 150 to 200 people. The claims in the group have been bonded to these people by Max Engasser, who has held and developed them many years. The Copper Basin M. Co., controlled by J. F. Curtis and T. M. Drennan, sank a 60-ft. shaft, at the bottom of which was found a 4-ft. vein of ore that assayed about 50% copper. The ore is mostly chalcocite. The property is in Copper basin, 18 miles north of Parker.——The Goodman mine, which was a rich producer in early days, now belongs to W. E. Scott, of Quartzsite, who has built a Nissen stamp-mill, to which he hauls the ore a distance of 12 miles. The gold extracted is sufficient to pay expenses of developing, mining, and milling. The mine is said to contain an 18-in. paystreak that mills $65 per ton in gold. A Lane mill is being operated on the Safford mine, near Vicksburg.

CALIFORNIA

CALAVERAS COUNTY

The Calaveras Copper Co., having mines at Copperopolis, with a concentrator and smelter nearly finished, was closed down January 1, except that the mine pumps are being kept in operation. The Lightner mine in Angels Camp is being re-opened under direction of Alex. Chalmers, who is having a 3-compartment shaft sunk, which is now at a depth of about 200 ft. This work is being done at the expense of recent purchasers of the property, who expect to have the mill started in April.

NEVADA COUNTY

(Special Correspondence.)—The Idaho-Maryland Co. has permitted several parties of 'tributers' to commence work on various pieces of ground. It is stated that several 'pitches' are showing good ore. At the Empire the new cyanide annex is operating satisfactorily. Development is in progress on the 3500-ft. level. Considerable rich ore has been recently extracted. The 40-stamp mill is operating continuously. At the North Star operations are confined principally to the Central workings, the upper levels of the mine receiving little attention. The vein continues 6 ft. wide, the ore averaging $12 per ton. At the Cincinnati Flat mine the company is developing with encouraging results. On December 31 the North Star Mines Co. declared a dividend of $275,000, which is at the rate of $1.10 per share. This makes a total of $575,000 paid during 1910. Since its incorporation in 1899, this company's dividends have amounted to 102% on its capital stock. At the Birchville mine, Graniteville district, large reserves of milling ore have been opened. The plant, which was destroyed by fire last summer, is being rebuilt, and the hoist will soon be ready for work. During the winter, work will be performed on the levels above the drain tunnel. Fifteen men are employed. At the Ancho, 15 men are working, and the mill is running steadily. George Mainhart is superintendent. At the Erie 40 men are employed on development, and a new compressor has been installed. The Sultana group, comprising the Sultana, Prescott Hill, and other mines, has passed into new hands, for whom Richard Barry is superintendent.

Grass Valley, January 9.

PLACER COUNTY

The Helester M. Co. has paid the balance of the purchase price of the Rawhide mine, situated six miles from Alta, on the north fork of the American river. A wagon-road has been built from Gorge station to the mine. Frank B. Keever is at the head of the company. The Pioneer mine, in the same locality, is being put in condition for operating.

PLUMAS COUNTY

The Gruss mine, situated in Genesee valley, which has been owned by the Gruss family for 30 years, has been leased for a term of seven years to Geo. H. Gruss and C. C. Kinsey, who are preparing to re-open the mine and operate the 15-stamp mill. The Gruss is a gold mine which has been much worked above the 100-ft. level. The purpose of the lessees is to sink 100 ft. deeper and establish a 200-ft. level. The vein is on the contact of grano-diorite and slate, has a dip of 45°, a width of 5 ft., has free-

Part of Northern California.

milling ore that assays $6 per ton. The property has a steam-hoist, and has water-power for the mill and mine pump. The mine is 22 miles from Quincy, and 15 miles from Keddie, a station on the Western Pacific. Santa Cruz people have taken an option on the Carr placer claims in Grizzly range, and have commenced drilling through the lava capping to the gravel. As soon as the latter has been explored and tested it will be opened by an adit.

RIVERSIDE COUNTY

The ore being mined at the Calzona, Sanborn, and Steece mines is attracting much attention to Riverside mountain, situated 17 miles westerly from Parker, Arizona. Ore sacked at the first two properties has been shipped to the Humboldt smelter, and the third named is to send out some ore this month. The Calzona attracts special interest by reason of the discovery in December of a 7-ft. vein of ore, samples of which assayed over $200 per ton in gold, besides the high copper content.

SHASTA COUNTY

(Special Correspondence.)—The Uncle Sam mine, six miles west of Kennett, has been bonded from Fred Dakin by the Big Seven Con. Gold Mining Co., controlled by F. W. Richards, H. D. Staley, and F. H. Caulke. It is understood that the consideration is $60,000 and that the Big

Seven will probably purchase the mine. A 10-stamp mill was recently erected and contracts have been signed for the delivery of electric power. Developments will commence at once. F. W. Richards is superintendent. The Square Deal Co. is arranging for the erection of a mill at the Clipper mine, where recent development has been satisfactory. The Noble Electric Steel Co. has resumed smelting at Heroult. About 15 to 20 tons of pig iron is being produced daily, at a cost of about $14 per ton. As soon as materials arrive from the East, the construction of five new furnaces will be commenced. The company has opened deposits of ore in its iron and chrome mines during the past few months. At the Gladstone the mill is running and a force of men is employed. The shaft is down 1700 ft. with good ore showing in the lower levels. At the Evening Star arrangements are being made for operating more extensively. This property recently passed into the hands of a German syndicate. George Bayha is manager.

Redding, January 7.

The United States S. R. & M. Co. is operating three copper furnaces at its Kennett plant, the fume and smoke from which are passed through the bag-house, in which most of the elements that would be harmful to vegetation are being precipitated.

SIERRA COUNTY

The Sovereign Mines Co. has opened the Nevada vein by driving a 661-ft. cross-cut; the depth at which the vein was tapped gives 350 ft. of stoping ground above that level. This vein has a width of 5 ft., the ore assaying $15.50 to $40 per ton. Ore-bins and other buildings are to be erected. F. O. Richardson, of Downieville, is the company's manager.

SISKIYOU COUNTY

The Scott Bar Hydraulic M. Co. has been incorporated to take over and operate several placer mines in this county. Los Angeles men are concerned in the company.

COLORADO

The metal production of Colorado for 1909 and 1910 is given below. The figures for 1909 were supplied by the State Bureau of Mines; those for 1910 are estimates based on data of the United States Mint, the A. S. & R. Co., Ohio & Colorado S. & R. Co., and Empire Zinc Co. The figures on tungsten are those of John R. Wood of the Boulder County Metal Mining Association:

1909—Gold, 1,061,663 oz., $21,946,684; Silver, 8,908,046 oz., $4,587,643; Lead, 64,720,646 lb., $2,765,512; Zinc, 41,728,107 lb., $2,295,046; Copper, 10,087,950 lb., $1,220,642; Tungsten, 1100 tons, $396,000; total value for 1909, $33,211,527.

1910—Gold, 982,581 oz., $20,311,944; Silver, 8,592,350 oz., $4,590,244; Lead, 74,966,344 lb., $3,365,989; Zinc, 62,651,021 lb., $3,376,890; Copper, 8,408,963 lb., $1,062,051; Tungsten, 1535 tons, $736,800; total value for 1910, $33,443,918.

CLEAR CREEK COUNTY

(Special Correspondence.)—Work has been resumed on the Edgarine mine, Seaton mountain. The shaft, now down 40 ft., is to be sunk 100 ft. deeper. The vein contains a streak of ore, samples of which assay $300 per ton. W. T. Chappell, owner of the Standard group of claims on Fall river, is developing the property. The Miller adit is being driven to intersect the veins. Owing to scarcity of water the mill has been closed down for the winter. Development is in progress at the Shafter mine on Believue, and shipments of both smelting and concentrating ore are being made. A. H. Rolier, of Idaho Springs, is manager. Ore is being shipped from the Humboldt mine, the adit in which is being driven. K. Seeman is manager. C. Howard has resumed work on the Ohio property, Kelso mountain. An 8-in. streak of galena is showing in the heading of the adit that mills $62 per ton in silver and lead. The production of upper Clear Creek district for 1910 amounted to $462,000, a gain of 30% over the previous year. The lower end of the county, near Idaho Springs, produced $1,250,000. Work will be resumed on the Charter-Raton property, Breckenridge mountain.

Georgetown, December 28.

GILPIN COUNTY

(Special Correspondence.)—Shipments of both mill and smelting ore are being kept up from the National mine. Shipments have been started at the Cashier, by Lampshire & Co. The ore is high grade, containing 4.72 oz. gold per ton. Work has been resumed on the Single Jack property by Stewart & Co., who are driving to intersect the series of veins. Heavy shipments are being sent out from the Perigo mine, operated by J. E. Lightbourn. A 6-in. streak of ore found in the Baker property, Quartz hill, assayed $80 per ton in gold and silver. The Lone Star mine, in Phoenix district, is shipping ore that samples $70 per ton in gold and silver. In the adit being driven on the San Juan vein a cross-lode has just been intersected that has a width of 12 ft. between walls.

Central City, January 6.

LAKE COUNTY

The 1910 metal production of Leadville, as compiled by the *Carbonate Chronicle*, was as follows: gold, 53,847 oz., $1,113,017; silver, 3,365,579 oz., $1,799,575; lead, 21,395,481 lb., $960,657; copper, 4,808,586 lb., $607,324; spelter, 47,381,760 lb., $2,553,876; total value of output, $7,034,450. The classification and amount of ore from which the metals were extracted are as follows: carbonate of lead, 14,369 tons; oxidized iron, 73,745; sulphide of lead and iron, 273,829; zinc sulphide, 82,608; zinc carbonate, 10,139; siliceous ore, 34,008 tons; a total of 488,694 tons.

One of the latest projects of the Leadville district is the driving of a deep tunnel from California gulch to Iowa gulch for the purpose of opening the Lillian ore-shoot. Driving on this adit has been in progress during the past year under direction of C. J. Hersey. The London mine, situated on the Mosquito range, east of Leadville, above timber-line, ten miles from Fairplay, has been operated most of the time during the last thirty years. It contains a vein of ore averaging about 3 oz. gold per ton. The mine has been under lease for some time to J. M. Kuhn, who recently secured an extension of his lease. Ore mined in the past was taken from stopes on and above the lowest adit-level, but now that the workings extend by winzes below this level the operations are hindered by a large volume of water. It is now proposed to drive a cross-cut which is to intersect the vein 600 ft. lower than the present deepest workings, thereby draining the mine and gaining access to stoping ground above that level.

PARK COUNTY

The Colorado Smelting Co., operating a 240-ton smelting furnace at Alma, has treated a considerable tonnage of ore that had accumulated on the dumps of various mines of that section, as well as ore being mined now. The product of the plant is a matte that is marketed. A force of 100 men is employed by the company at its smelter and mines.

SUMMIT COUNTY

Summit county's metal production for 1910, as compiled by R. J. A. Widmar, of Breckenridge, was as follows: gold recovered by three dredges, $612,476; gold nuggets and specimens, $17,588; gold from smelting ore, $86,400; silver $112,500; zinc, $128,607; lead, $117,630; iron as flux, $15,500; copper, $3127; aggregate value of output, $1,093,828.

TELLER COUNTY

Cripple Creek's output of gold ore for December 1910 was 74,240 tons, the value of the bullion extracted therefrom being $1,400,000. The ore mined and treated during 1910 amounted to 754,941 tons, the gold bullion extracted amounting to $15,835,937. The profits that accrued to company and individual operators, including lessees and lessors, are estimated at $2,100,000 for the year.

IDAHO

SHOSHONE COUNTY

The Stewart Mining Co., controlled by F. A. Heinze and associates, is mining 300 tons of ore per day at the Stewart

mine, situated in Wardner district. The ore is concentrated in a leased mill at Wallace. It is stated that the company's indebtedness has been reduced from $185,000 to $93,000 during the last half of the year, the payments having been from mine proceeds. The Snowstorm Mining Co., operating the Snowstorm mine at Larson, three miles from Mullan, is reported shipping 100 tons of ore per day, and the mine force has been increased. The most interesting development is on the level of No. 4 adit, which is intended to cut the orebodies several hundred feet below the main workings. The Copper King group, situated near Mullan, is being further developed by an adit which has been driven 3400 ft., by which the lead-silver vein is to be opened 1000 ft. below the former workings. H. W. Ingalls is in charge of this work.

NEZ PERCE COUNTY

The Wild Rose mine, near Pierce, owned by the Ozark M. & M. Co., has produced about $1,000,000 in gold since 1905. It is given out that a 200-ton concentrating and cyanide mill will be erected and put in operation by next August, to treat ore from both the Wild Rose anad Ozark mines. George S. Bailey, Joseph A. Muir, J. H. Bethel, and A. J. Parker are active in the control of the property. In developing the property a cross-cut, driven 1319 ft., intersected nine veins, the last being 32 ft. wide at a depth of 576 ft. A 16-in. streak of ore on the foot-wall assays from $20 to $140 in gold per ton. The body of the vein averages $9.40. The ore consists of white quartz, containing some petzite.

NEVADA

CLARK COUNTY

The Quartette mine, situated at Searchlight, has been in operation twelve years and has produced $2,500,000. It is opened by two shafts, 700 ft. apart; one of these, 900 ft. deep, serves only as an air-shaft; the other is a 1300-ft. incline and serves as the main working shaft, in which ore-skips are operated by a 60-hp. distillate hoisting engine of Fairbanks-Morse manufacture. There are nearly five miles of workings, and these are confined to one fissure vein in porphyritic andesite. In the main, the ores are gold-bearing and free-milling; on the hanging wall side of the vein are some lenses of chrysocolla, also some carbonate and sulphide of copper and lead, containing gold and silver. The copper and lead ores are hand-sorted and shipped to the smelters. The gold and silver ores are treated in the 40-stamp mill, and the metals recovered by amalgamation and cyanidation. According to official information supplied by the company the average heads of all ore milled since the Quartette company began operating was $16.45 per ton; the average value of ore shipped to smelters was $80 per ton. The cyanide plant has been operated to some extent on former mill-tailing, which, added to current tailing, brings the leaching heads up to $3.30 per ton. The stamp-milling cost is given at $1 per ton, that of cyaniding being $1.63; the high cost of the latter was due to the presence of copper in the tailing. This figure was only attained by the cyanide regeneration process as developed by R. P. Wheelock. Shipments of zinc ore from the Potosi mine at Good Springs are being made to St. Louis. J. B. Jensen is the purchaser, who has a contract with the Potosi people for the output of the mine, up to 500 tons per month. The ore-wagons are drawn by traction engines. A concentrating mill is being built at the Yellow Pine mine; some custom ore is to be treated, also, as soon as the plant is finished. The Yellow Pine has large bodies of zinc-lead ore, which have been opened to a depth of 500 feet.

NYE COUNTY

The ore-production of seven Tonopah mines for the week ended December 17 aggregated 8278 tons, of an estimated value of $206,950. The Tonopah company shipped 3500 tons; the Belmont, 2000; Montana-Tonopah, 1028; MacNamara, 320; West End, 400; Tonopah Extension, 980; Midway, 50 tons. The tonnage for each of the succeeding two weeks was practically the same. The Tonopah-Belmont Development Co., now in the ascendant among Tonopah operators, made a profit of $127,032.89 for the month of November. During that month this company mined 7615 tons of ore, of which 1531 tons was shipped to the smelters, and 6084 tons was milled at the company's plant. There was extracted from this, 3223.06 oz. gold, and 332,176.27 oz. silver; gross value of output, $241,188.04. The electric hoist and air-compressor at the new Belmont shaft are in use and the centre of mine operations has been transferred from the old Desert Queen shaft to the Belmont. The new shaft has a depth of about 1200 ft., and the intention is to sink farther. The Tonopah Extension M. Co. produced bullion and concentrate of the value of $22,000 during the first half of December. At the Desert mill of the Tonopah M. Co., 3362 tons of ore was crushed during the week ended December 16, the value of the ore averaging $24.34 per ton. Bullion shipped from this mill for the same week was valued at $45,078.79; besides, 40 tons of concentrate, valued at $20,072.78, was marketed. For the week ended December 31, this company milled 3350 tons of ore that averaged $24.50 per ton, and bullion shipments for the week amounted to $100,000. The *Tonopah Miner* of December 31, 1910, reports the ore-production of the district for the year at 362,898 tons, of an estimated value of $25 per ton, making a total of $9,072,325. Of this sum $2,721,696 was for gold, and $6,350,629 was for silver.

STOREY COUNTY

A Starrett pump, manufactured by the Starrett Pump Co. at Salt Lake, has been installed and put in operation at the 2450-ft. station of the C. & C. shaft at Virginia City, raising

Map of Central Nevada.

600 gal. of water per minute to the 2150-ft. station, a height of 300 ft. The water discharged at the latter station is lifted to the Sutro drainage level by Reidler pumps. A 4-stage turbine pump, of the Byron Jackson make, is being installed at the 2350-ft. station to replace other pumps that require repairing. The east cross-cut on the 1650-ft. level of the Con. Virginia workings is being retimbered and the stoping ground is being sampled. For the week ended December 24 the production of the Ophir was $15,706.45, and that of the Con. Virginia was $2399.40. The 185 mine-cars of ore taken from the Ophir had an average value of $84.89 per ton, the richer ore being taken from the Hardy vein. The 239 mine-cars taken from the Con. Virginia averaged $9.74 per ton. The Yellow Jacket mill crushed 865 tons of ore for the week, 548 tons having been received from the Yellow Jacket mine, and 316 tons from the Crown Point. The best ore from the former was mined on the 1400-ft. level; development work at this mine has been suspended for the present, awaiting pumping facilities to be supplied at the Ward. Of the Crown Point ore, 60 mine-cars assayed $8.88 per ton; 285 cars averaged $3.63; and 12 cars contained $5.60 per ton. The Belcher output consisted of 116 mine-cars, averaging $5.75; 106 cars, $7.84; 64 cars averag-

ing $3.25 per ton. Whitman Symmes, superintendent for the Mexican G. & S. M. Co., reports for the year ended October 30, 1910, having sunk a two-compartment winze 276 ft. to a point 12 ft. below the 2500-ft. level; also that east cross-cuts were driven on the 2400 and 2500-ft. levels at a speed of 50 ft. per week for several weeks; similar cross-cutting is reported having been done on the 2100, 2200, 2300, 2400, and 2500-ft. levels, with a considerable amount of driving in ore. This development resulted in exposing an additional supply of ore. Development work for the year aggregated 3870 ft.; ore shipped to the Charles Butters Co. mill, between August 25 and October 30, amounted to 2206 tons of the value of $43,564.15. The exploration work performed below the 2000-ft. level has been in the southern part of the mine, but the intention now is to extend such work into the northern part. The water-level is now at 2500 ft. in the Mexican mine, but as soon as the old drifts of the Con. Virginia and Ophir are opened it will be feasible to unwater the joint Ophir-Mexican winzes from the 2500 to the 2900-ft. level. The operating expenses of the Mexican company for the year were paid out of funds derived from the sale of ore mined.

NEW MEXICO

GRANT COUNTY

The concentrating mill of the Chino Copper Co., being erected at Hurley, nine miles from the Chino mines, doubtless will be ready to operate by July 1. The steel building is to be finished by February 1. In the meantime five steam-shovels are being kept operating at the mine removing overburden to expose the orebody. The first shipment of zinc ore was made in December by George H. Utter from Cleveland mines in Pinos Altos district, six miles from Silver City. The ore was shipped to Canon City, Colorado. Other shipments are being made to the various zinc-ore markets.

SOCORRO COUNTY

(Special Correspondence.)—The Socorro mine and mill, in the Mogollons, operated every day in December except on Christmas. The ore mined and crushed during the month averaged 120 tons per day; the product from this was in the form of silver and gold bars and concentrate. A contract has been let for sinking the 3-compartment shaft 140 ft. deeper. The Ernestine M. Co. produced 5686 oz. silver and gold bullion, and 50 sacks of concentrate for the week ended December 31, from 669 tons of ore. The mill at the Deadwood mines was to have begun operating January 2. The De La Vergne high-compression oil-engine has been thoroughly tried at this mine, the result of which is said to demonstrate that with crude oil laid down at Mogollon and used in this engine, power here will cost less than $150 per horse-power-year, and in this cost is included that of oil, labor, and depreciation. The Gold Dust Mines Co. has finished its office quarters and established telephone lines to Silver City and Mogollon. Its connection shaft has reached a depth of 80 ft., and the east and west drifts from the cross-cut have been advanced 150 ft. on the vein.

Mogollon, January 7.

OREGON

JOSEPHINE COUNTY

(Special Correspondence.)—The Almeda Consolidated Mines Co., operating in Galice district, has over 6000 ft. of development, whereby a strong vein of gold, silver, and copper ore has been opened 1500 ft. on its strike, and to a depth of 500 ft. The mine is opened by adit levels, and by a 500-ft. vertical shaft. The work of tapping the vein by a cross-cut from each 100-ft. station is now in progress. The orebody is made up of three distinct seams: the first containing 15 ft. of first-grade ore, the second having about 35 ft. of second grade, and a third seam of low-grade stuff. The width between the walls is about 100 ft. The ore is a sulphide, and is nearly self-fluxing. The mine is well equipped with gasoline engines, for hoisting and operating an air-compressor and dynamo; also one steam-engine. A plant for semi-pyritic smelting was recently finished. It contains a copper-matting furnace, ore-crusher, elevator, ore-bins of 3000 tons and coke-bins of 500 tons capacity. The installation of a basic-lined converter is contemplated, whereby the matte may be reduced to blister copper. The furnace has not been blown in; and this will not be done until the hard-surface auto-truck road is finished from Galice to Leland, a distance of 15 miles, thus enabling the company to haul in its coke supply at the cost of about $1 per ton. The property is under the management of John F. Wickham.

Galice, January 3.

UTAH

BEAVER COUNTY

The Red Warrior, in Star district, has a new orebody, which was found by driving a cross-cut from the 500-ft. level. Ore is to be stoped from this vein and shipped. It contains lead and silver. The Cedar-Talisman, in the same district, recently marketed two cars of lead-silver ore; besides, the mine has been for some time a producer of zinc ore which is shipped to Oklahoma. Ore being shipped from the Lady Bryan and Hub mines of the Utah M. M. & T. Co. amounts to about 8 cars per month. Much of the output is taken from the 300-ft. level of the former, and contains about 50% iron, 90 oz. silver, and about 6% lead. The shaft, which is more than 300 ft. deep, is expected to cut the vein on its dip at 500 ft. John Thompson has charge of the work. Shipments of ore from the Moscow mine for December amounted to 7 carloads, net returns from which were about $2000 per car. One lot sampled 26% lead, 3.8% copper, and 73 oz. silver per ton. The Moscow M. Co. has paid off its indebtedness of $30,000.

JUAB COUNTY

The Dragon, in Tintic district, is a big producer of iron ore. It is operated through a 960-ft. shaft, which will have reached a depth of 1000 ft. in a short time, after which levels will be driven to the orebody from the 800 and 1000-ft. stations. Ore shipped from this mine during 1910 amounted to 1025 carloads; the only mine in the district exceeding this was the Centennial-Eureka, from which 1630 cars were shipped. The ore shipments sent out from all the mines of the district in 1910 amounted to 7404 cars. A new orebody has been opened at 400-ft. depth in the Lower Mammoth, and two cars of ore taken from this part of the mine were shipped. The directors of the Utah Mine declared a dividend of two cents per share, which was paid December 21. This is the first dividend since February 1909. The mine is at Fish Springs, in the western part of the county.

UTAH COUNTY

A. W. Clemons and associates have developed a 6-ft. body of ozokerite on their claims near Colton. The material is said to contain 30% of this mineral wax. The property is under option to S. V. Shearer.

CENTRAL AMERICA

COSTA RICA

(Special Correspondence.)—The November report of S. F. Shaw, general manager for Montezuma Mines of Costa Rica, gives a detailed account of the month's development on San Rafael, Montezuma, and San Juan veins. It shows a mine production of 2735 tons of ore. There was treated in the mill 3251 tons of ore averaging $9.95 per ton; the mill-tailing assayed $1.26 per ton, the apparent extraction being $8.69 per ton, or 87.2%, and a total of $28,251.29. The consumption of cyanide was 4.34 lb. per ton of ore treated; that of lime, 6.43 lb.; lead acetate, 0.06 lb.; pebbles and lining, 2.31 lb.; zinc, 0.84 lb. Mining costs were $1.38; milling, $1.85; making a total of $3.23 per ton. The estimated profit for the month, based on 2735 tons of ore mined, and 3251 tons milled, was $5.46 per ton, giving $18,430.04. During December the survey was to have been made for the transmission line to the falls of the Barranca Guatusa river where the power plant is to be built. Development progresses at 10 headings.

Montezuma, December 6.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

OVERLAPPING CONFLICTING CLAIMS

A discovery shaft which bisected the west end line of a mining claim was sufficient to support a lode location; and a subsequent location which overlapped the west end line and included the discovery would be void, to the extent of the conflict. And in an action to determine the conflicting lode location, the burden was upon the last locator to prove by clear and convincing evidence that the first locator's claim was subject to forfeiture and relocation because of the failure to perform the required representation work.

Tiggeman v. Mrzlak, (Mont.) 105 Pac. 77. Nov. '09.

LOCATION OF MINING CLAIM—RECORDING NOTICE

The recorded notice of a mining claim need only be similar to that posted upon the grounds, and show that the person claims the land described and identified therein; and where a notice recorded was a copy of a posted notice, which was insufficient because it was not posted within the claim, and the fact that a valid notice was subsequently posted, which differed from the first notice only in omitting the name of a witness, but was not again recorded, was said to be immaterial as against subsequent claimants. In other words, a valid notice of location may be posted after the notice is recorded.

Green v. Gavin, (Cal.) 105 Pac. 761. Dec. '09.

RIGHT TO SUE FOR INJURY INCURRED IN MINING

Under the Pennsylvania statute giving the right of action to a person injured for failure to provide for the health and safety of persons employed in and about anthracite mines, and in case of death giving the widow and heirs the right to recover, it was decided that the word 'widow' did not include a non-resident alien widow, and that a widow who was an Italian subject, and was residing in Italy, was not entitled to recover under the statute for the death of her husband in a coal mine in Pennsylvania, notwithstanding such a right might be enforced under the laws of Italy.

Debituila v. Lehigh & Wilkes-Barre Coal Co., 174 Fed. 886. Dec. 1909.

LOCATION OF MINING CLAIM—DECLARATORY STATEMENT

The declaratory statement of the discovery of a lode mining claim sufficiently identifies it, if under any reasonable construction, in view of the surrounding circumstances, the description therein is sufficient to notify a subsequent locator that the particular part of the ground claimed has been located. On this theory a lode mining-claim location was declared void, where the discovery shaft was made within the boundaries of a prior location. The laws of Montana do not require the declaratory statement of a discovery of a lode mining claim to describe the claim by metes and bounds; and where the original monuments have disappeared the calls for distances in the declaratory statement will control over testimony as to the location of the original monuments, and a claim ascertained from bounds clearly fixed by such calls, such as discovery shafts, will prevail over a subsequent conflicting location; and any deviation from the calls in the declaratory statement filed upon the discovery of a lode claim in making a survey, would not prejudice an adverse claimant where such deviation reduced the length of the end lines of the claim where it conflicted with an adverse claim; as the lines of a lode claim could not be so fixed as to include ground not covered by the original location. The fact that a subsequent location overlapped the west end line and included the discovery, would not affect the validity of a prior location, where such location was supported by a discovery shaft which was bisected by the west end line of a claim.

Tiggeman v. Mrzlak, (Mont.) 105 Pac. 77. Nov. '09.

Company Reports

DALY WEST MINING CO.

The Daly West Mining Co., of Park City, Utah, has issued its report for the quarter ended September 30, 1910. The statement shows sales of 3760 tons of concentrate, for $138,789.67; 2302 tons zinc concentrate, for $31,605.53; and 607 tons, miscellaneous shipments, $6767.68; a total of $177,160.88. Other receipts, $9542.75; Little Bell Con. divldend No. 4, $3000, a total of $189,703.63. The cash on hand brought the available funds to $356,084.23. Disbursements were as follows: On general account, $154,969.46; dividend No. 52, $54,000; leaving cash on hand September 30, $147,114.77. Operating expenses for the quarter showed a profit of $34,734.17. Some additional ore was opened on the 1500-ft. level, the 1800-ft. level, and in various raises, but no large amount in any place. The vein was cut on the 1900-ft. level and ore of good grade found, but the shoot was shorter than on levels above.

LUCKY TIGER-COMBINATION GOLD MINING CO.

The Lucky Tiger-Combination Gold Mining Co. has issued a statement, dated December 15, 1910. It shows the payment of dividend No. 29, of $35,750, making a total of $910,000 since August 1908, distributed as follows: In last five months of 1908, $71,500; in 1909, $409,500; in 1910, $429,000. The net profit for the first nine months of 1910 was $444,608.91. Disbursements on account of new mill to December 1, 1910, approximately $175,000. Cash received from sale of ore and concentrate from January 1 to December 1, 1910, $927,009.04. Ore and concentrate in transit to smelter, December 1, 1910, $175,000. Cash from sale of ore and concentrate, December 1 to December 10, 1910, $68,291.18. The mine is reported as looking well. Ore milled during nine months period, ended September 30, 1910, 27,785 tons. Work is progressing rapidly on the new mill which will be completed during the coming spring. The work of building an electric transmission line from Douglas, Arizona, to the mine, a distance of 65 miles, is well under way. The annual statement for 1910 will be issued before the annual meeting march 20, 1911.

NEVADA CON. COPPER CO.

The fourth annual report of the Nevada Con. Copper Co. for the year ended September 30, 1910, has just been issued. It is an elaborate affair, the fine, large illustrations giving a comprehensive idea of the magnitude of mining operations and the methods employed. The report of the president states that, during the year covered by the report, 62,772,342 lb. of copper were produced at a net cost of 6.42c. per lb., or, including the funds set aside for improvements and depreciation, 7.05c. This was accomplished during a severe winter which greatly retarded open-air operations. During July 7,000,000 lb. of copper were produced at a cost of 6c. per lb. The ore reserves have been increased 50% during the year, the increase being estimated at the close of the year at about 14,000,000 tons, with a total available tonnage aggregating 41,000,000 tons. By introduction of improvements in the original plan of the concentration plant the capacity of the metallurgical branch was increased to 8000 tons daily, from 6000 tons as originally expected. During the year 2,237,028 tons of ore were milled and the concentrate, at a ratio of 10.6 to 1, smelted. The percentage of copper recovered was 69.59% of the assay value, a loss of more than 30% between the mine and the copper bars as they came from the converters. The recovery of gold and silver was less than 50% of the assay value, due to the small amount of these metals in the ore. However, the amount of gold and silver actually recovered amounted to 21.14 cents per ton of ore treated. It is expected to reduce the cost of converting somewhat by the introduction of basic-lined converters. All smelting was done in reverberatories, owing to the character of material treated—concentrate.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

Draper & Gross are now at 745 Equitable building, Denver.

T. Lane Carter, of Chicago, is examining mines in Arizona.

F. E. Youngs, of Seward, Alaska, is at the Palace hotel, San Francisco.

Henry B. Kaeding is now at the Candor mines, Candor, North Carolina.

Russell Yale Hanlon expects to open an office at Manila, Philippine Islands.

L. S. Cates is now mine superintendent for the Ray Consolidated, at Ray, Arizona.

Harold Rickard is now in charge of the laboratory of Sanford C. Prunty, at Guadalajara, Mexico.

N. S. Kelsey, who has been in the Black Hills on examination work, has returned to San Francisco.

E. W. Keith, of the Empire Zinc Co., of Denver, was at the St. Francis, San Francisco, on January 7.

J. Allen Veatch has opened an office as consulting mining engineer at 601 Balboa building, San Francisco.

John Dern, of Salt Lake, president of the American Mining Congress, was at the St. Francis, San Francisco.

J. M. Porter is consulting engineer for the Standard Con. M. Co., whose property is at Silverton, British Columbia.

Regis Chauvenet is spending some time at Mt. Franklin, near El Paso, Texas, where he is interested in a tin mine.

E. A. S. Wittard has gone to the Original Amador mine, at Amador City, California, as assistant to W. Deaner, the manager.

Charles A. Sulzer expects to spend several months in the East. His address will be 649 Madison avenue, Elizabeth, New Jersey.

M. K. Rodgers, of Seattle, visited the Nickel Plate mine, of which he was former manager, at Hedley, British Columbia, last week.

S. E. Bretherton is examining mines near Winthrop, California, and from there will go to Seneca, Plumas county, where he will be until January 22.

Edgar A. Collins, general superintendent for the Montana-Tonopah Mining Co., has opened an office in the First National Bank building, San Francisco.

J. L. Gross, of Draper & Gross, has returned to Denver from Mexico and will shortly leave for the San Juan. Marshall D. Draper has left Denver for California.

D. R. Muir has succeeded L. D. Godshall as manager for the Needles Mining & Smelting Co. Mr. Muir was formerly at the Kennett plant of the United States S. R. & M. Company.

OBITUARY

Robert Forrester, for twenty years identified with coal and metal mining in Utah as an engineer, died at Seattle in December 1910. He was born in Scotland in 1854, was graduated from the University of Edinburgh, and was a member of a number of engineering and scientific societies. He was a resident of Salt Lake, and is known especially for his work in getting together the properties of the Utah Fuel Co. Mr. Forrester was an excellent geologist, and as an operating man was not content with routine, but was constantly engaged in experimental work directed toward greater safety or economy. One of his achievements was that of perfecting a plan for using dynamite, with wood pulp tamping, in coal mining. Contrary to natural expectations accidents and percentage of fine coal were both decreased. He was one of the men who go to prove that a university education does not unfit men for practical work.

CURRENT PRICES FOR ORES AND MINERALS

(Corrected monthly by Atkins, Kroll & Co.)

The prices are approximate, subject to fluctuation, and to variation according to quantity, quality, and delivery required. They are quoted, except as noted, f.o.b. San Francisco. Buying prices marked*.

	Min.	Max.
Antimony ore, 50%, per ton	*$20.00	$25.00
Arsenic, white, refined, per lb	0.02½	0.03
Arsenic, red, refined, per lb	0.07	0.08
Asbestos, according to length and quality of fibre, per ton	100.00	350.00
Asbestos, lower grades, per ton	10.00	100.00
Asphaltum, refined, per ton	15.00	20.00
Barium carbonate, precipitated, per ton	42.50	45.00
Barium chloride, commercial, per ton	42.50	47.50
Barium sulphate (barytes), prepared, ton	20.00	30.00
Bismuth ore, 10% upward, per ton	*75.00	upward
Chrome ore, according to quality, per ton	10.00	15.00
China clay, per ton	15.00	20.00
Cobalt metal, refined, f.o.b. London, per lb	2.50	
Coke, foundry, per 2240 lb	15.00	17.50
Diamonds:		
Borts, according to size and quality, per carat	2.00	15.00
Carbons, according to size and quality, per carat	75.00	100.00
Feldspar, per ton	5.00	25.00
Firebrick:		
Bauxite, per M	175.00	200.00
Magnesite, per M	200.00	250.00
Silica, per M	47.50	
Flint pebbles for tube-mills, per 2240 lb	15.00	25.00
Fluorspar, per ton	10.00	15.00
Fullers earth, according to quality, per ton	20.00	30.00
Gilsonite, per ton	32.50	45.00
Graphite:		
Amorphous, per lb	0.01	0.02½
Crystalline, per lb	0.04	0.13
Gypsum, per ton	7.50	10.00
Infusorial earth, per ton	10.00	15.00
Magnesite, crude, per ton	7.50	10.00
Magnesite, dead calcined, per ton	22.50	27.50
Magnesite, brick (see firebrick).		
Manganese ore, oxide, crude, per ton	10.00	25.00
Manganese, prepared, according to quality, per ton	40.00	120.00
Mica, according to size and quality, per lb	0.05	0.30
Molybdenite, 95% MoS_2, per ton	400.00	500.00
Monazite sand (5% thoria), per ton	150.00	200.00
Nickel metal, refined, per lb	0.45	0.60
Ochre, extra strength, levigated, per lb	0.02½	0.03½
Platinum, native, crude, per oz	*20.00	25.00
Scheelite (see tungsten ore).		
Sulphur, crude, per ton	15.00	25.00
Talc, prepared, according to quality, per ton	20.00	50.00
Tin ore, 70%, per ton	*400.00	450.00
Tungsten ore, 65%, per ton	500.00	550.00
Vanadium ore, 15%, per ton	*100.00	125.00
Wolframite (see tungsten ore).		
Zinc ore, 50% up, per ton	*15.00	20.00

COMMERCIAL PARAGRAPHS

H. G. Peake, for the past six years chief engineer for the Yuba Construction Co. and the Boston Machine Shop Co., and for three years previous to that time with the draughting department of The Bucyrus Co. at South Milwaukee, has entered into partnership with W. W. Johnson to engage in the designing and building of placer mining dredges. Mr. Johnson was formerly one of the owners of the Northern Dredge Building & Construction Co. and designed and built three dredges in Alaska last season. These dredges were built for the Sioux-Alaska Mining Co., The Arctic Gold Dredging Co., and the Alaska Gold Dredging Co. He has been engaged in the designing and building of dredges for the past five years. The firm name will be the Union Construction Co. and offices have been opened at 604 Mission street, San Francisco.

In the Portland Canal district the Red Cliff mine has put in a 250-hp. steam and compressor plant, and found the ore continuation. It now looks like a good mine. The Portland Canal Mining Co. put in a 20-drill compressor, and a new concentrator. It is probable that next year will prove these and the Stewart mine. A vast amount of prospecting and preliminary work was done in the district. The Ikeda mine, Moresby Island, has been acquired by Vancouver capitalists and a company organized with a capital of $850,000 to work it. The Babine-Bonanza Mining Co. has proved that it has a mine in its Dibble group of six claims in the Babine mountains. A tunnel was driven under the ore for 1000 ft., proving it to a depth of 275 ft. Work has ceased pending the arrival of the G. T. P. railway.

APPOINTMENT of Mr. Frank W. DeWolf to the position of Director of the State Geological Survey of Illinois is announced. Mr. DeWolf has served as assistant geologist on the United States Geological Survey and as geologist and Acting Director of the Illinois Survey. His new appointment comes as a well-merited recognition of good work.

COPPER prices seem trembling in the balance. It is said that the American Smelting & Refining Company has been accumulating metal for two months and is likely to adopt the practice of the United Metals Selling Company of alternately holding back and deluging the market. Until recently copper was sold at market prices as fast as produced.

FOREIGN copper production in 1910 can not be accurately stated as yet, but according to estimates made by L. Vogelstein & Company, the world's production in 1910 was 865,000 long tons, compared with 844,100 in 1909. The consumption is estimated at 908,565 long tons of which America took 334,565, Germany 218,000, England 138,000, and France 91,000.

THE miners of the Pacific Coast States, as well as the agriculturalists are rejoicing at the liberal rain and snowfall of the past week. Unless there are abundant early snows in the Sierra Nevada, there is always a water shortage the following summer. It often occurs, however, that the rains are late in arriving, the greater part of the rain and snowfall coming after the first of the year.

ALASKA and the coal-land laws of that territory have been much discussed at Washington in the last year. As a result of a conference held at the White House January 12, a series of bills has been introduced in Congress by Mr. Knute Nelson, of Minnesota, opening the land to prospectors and providing for the granting of leases in blocks not exceeding 3200 acres. Details of these bills will be printed later.

GOLDFIELD CONSOLIDATED made a good showing at the annual meeting held at Evanston, Wyoming, January 9. The report for the fiscal year, which ended October 31, 1910, showed that 266,867 tons of ore of an average value of $40.72 per ton had been produced. This gave a gross production of $10,866,752, on which the net operating profits were $7,347,691. Dividends to the amount of $7,118,271 were paid.

ANNOUNCEMENT that the Western Engineering & Construction Company has been absorbed by the Yuba Construction Company marks the passing of one of the pioneer firms of gold-dredge constructors. Mr. F. W. Griffin and D. P. Cameron, first as a firm and later as the Western Engineering & Construction Company, built some of the first of the heavy boats at Oroville, California. From them came the 'California' type of dredges which, as distinguished from the 'New Zealand' type first introduced, are marked by heavy construction, and it is this that makes possible deep digging and high capacity. The Western Engineering & Construction Company introduced many of the features that are now common to all good dredges.

PHOSPHATE rock has been discovered in Montana as a result of work done by Mr. Hoyt S. Gale, of the United States Geological Survey. It seems probable that the field, which has been withdrawn from entry and is to be examined in detail, will prove to be large, and enough has been done to prove that the deposits are of good thickness and grade. The discovery was made by Mr. Gale in the course of land-classification work, and is more notable in that phosphate rock is not easily recognized and has previously been discovered by accident rather than as a result of careful scientific examination. Many Western phosphate beds were first prospected for coal; a mistake due to their bedded character and black color. In Tennessee the nature of the white phosphates was long unsuspected both by prospectors and engineers. In this case the geologists are ahead.

A VERY natural desire of mine managers is to be able to present a low cost-sheet for the inspection of their directors and stockholders, and incidentally for the illumination of the public at large, particularly the investing public. This ambition not infrequently leads to the careless or studied omission of important items of cost, which, if included, would radically change the tonnage cost. Such matters as the cost of power or of hoisting in mining certainly are proper entries in the mine cost-sheet, if power be employed. Then, too, there is sometimes a failure to distribute labor costs among the several departments, so that it is difficult to tell what proportion of the whole to charge to any particular portion of the mine. Some mine accountants fail to keep segregated costs of any kind, 'lumping' everything under operating cost. A cost-sheet need not necessarily be carried so far in its details as to render it absurd, as is sometimes done. It should, however, show the whole cost, with no omissions, and with a rational segregation of the cost of the various operations of mining so arranged that any business-man can find in it the information he seeks, without the assistance of an expert accountant to explain to him how it is that two and two do not make four, but something else. The suggestion made on another page by Mr. L. A. Whittaker, that a model 'Book of Accounts' be compiled for mines similar to that issued by the Interstate Commerce Commission for railroads, is in line with a resolution adopted by the San Francisco section of the Mining and Metallurgical Society last winter. The U. S. Bureau of Mines would be a proper agency for making the compilation. While under present laws the use of any single system could not be enforced, it would at least be helpful.

PETROLEUM production in the United States in 1910, according to preliminary figures collected by Mr. David T. Day, of the United States Geological Survey, amounted to 204,000,000 barrels. California led with an output of 73,000,000 barrels, a gain of more than 18,000,000 over 1909, nearly twice the remarkable increase of that year over 1908. The Mid-Continent field again ranked second, with an output, including the small amount of oil produced in the Rocky Mountain States, of 53,000,000. Illinois stayed in third place with 32,000,000 barrels to its credit, an amount that now equals the total production of all other States east of the Mississippi. The Gulf Coast fields, including Caddo in Louisiana, produced 14,000,000 barrels. It is interesting to recall that though production began in 1859 it was not until 1903 that the output of the United States amounted to 100,000,000 barrels per year. The second hundred million was added in just seven years. While some increases are to be expected and there are large areas of undeveloped territory, it is not probable that development will continue at the present rate.

Prospect First at Home

After sixty years of continuous and successful operation the Mother Lode of California continues to attract the attention of investors, and new enterprises, as well as the rehabilitation of old ones, call for frequent mention in our news columns. One of the latest is the West Eureka Company at Sutter Creek, which proposes to develop ground that heretofore has been only superficially prospected. At Plymouth the Alpine mine, which has lain idle for years, is being reopened; the Lincoln, at Sutter Creek, has recently been instilled with new life and the old workings are being unwatered. At Angels, a late report is to the effect that a new vein of rich ore has been discovered in the Lightner mine, and in Tuolumne county very rich rock has been found in the Tarantula mine. In fact, throughout the length of the great Lode new mines and old ones alike are being explored with results which will without doubt stimulate others to emulate the example of these fortunate investors. It merely emphasizes what was said in these pages recently. Search the old districts thoroughly before going to the ends of the earth to seek that which may be found at home. The great Mother Lode of California is 120 miles in length. Its deepest mines are 3500 feet below the surface, its production has been over a hundred million. By far the greater portion has not been explored even superficially. Here are

opportunities in a favored land, where costs can be predetermined and where success is quite as certain as in the heart of Africa, in Siberia, or in some other distant corner of the earth, difficult of access, but certain as to high cost, and uncertain as to result.

Look Out Below!

The past week has seen one more advance made in the inhuman art of war. An aviator near San Francisco took up with him as a passenger in his aeroplane, an ordnance officer of the United States Army, and the latter dropped from a height a specially prepared hand-bomb which exploded with terrific violence upon striking the earth. An examination of the vicinity where the bomb struck proved that a shell of this description, when exploded, scatters in all directions the materials of which the shell is constructed, as well as those with which it is filled, and that it would be very destructive of life within a radius of many feet. The bomb was a small affair, made for experimental purposes, but the test proved most satisfactory in its results; even beyond expectations. The natural conclusion to be drawn from this demonstration is that the dropping of explosive bombs from the sky upon an unsuspecting enemy will have a moral effect on contending armies such as is exerted by no other form of attack. The Maxim silencer, for small arms, and the gravity bombshell are likely to do much to promote peace.

Power on the Congo

It has been proposed to utilize the power of the river Congo in Western Africa where it flows in a series of rapids and falls, as it passes through the west-coast range of mountains which divides the great elevated central basin from the narrow strip of lowlands lying along the Atlantic coast. The purpose of this generation of power is to convert it into electrical energy to operate the railroad running from Matadi to Leopoldville. Matadi is at the western base of the mountains, on the south bank of the river Congo, 108 miles above its mouth; Leopoldville is on the river, above the falls and rapids, on the east side of the mountains, 345 miles from the sea by river, and 1147 feet above it. The river Congo is one of the greatest in the world. It is a tremendous stream at all seasons, draining as it does, over one million square miles of the great 'Dark Continent.' Below Leopoldville this great stream is confined at one place by the rocky cliffs of the west-coast mountain range to about 1300 feet in width. It rushes through the deep canyons in a series of rapids and wonderful falls. H. M. Stanley reported one sounding taken near the shore where the depth was 138 feet, and the current seven miles per hour. The potential energy which is here is almost beyond calculation or belief. That of the main river alone would be sufficient to operate not only all the machinery now in West Africa, and perhaps all that will be placed there, but possibly all that of Europe as well, could the mighty Congo be harnessed to the limit of its capacity, and the electrical energy transmitted. Besides this great power in the series of falls of the Congo, of which there are many, large streams enter from the sides, falling from 400 to 1000 feet within short distances. The future great value of the enormous power of these falls is limited almost wholly by the possibilities of economical transmission of the current to distant points where it may be utilized to best advantage. It may be many years before the Congo is utilized as a source of power, but when wanted, power certainly is available there in almost unlimited amount.

Progressive Mill Practice

California is often referred to as the cradle of gold mining, and such, indeed, it really is, but it is a matter of general surprise that there is a tendency in some directions, in California, to remain in the cradle. Particularly is this noticeable in the treatment of gold ores of the State. Other gold-mining regions throughout the world have in their early history, almost without exception, adopted California mill practices, but in many cases the newer countries have promptly drifted away from the 'time-honored customs' of California's millmen and evolved newer and better methods through experimentation, or have applied those already tried out in other new regions. In no district is this departure from traditional methods more radical than on the Rand. The ores of the Rand are relatively simple—a quartzose gangue with metallic gold and auriferous pyrite. The ore yields its gold readily to amalgamation and cyanidation. As concentration is not considered necessary on the Rand, the engineers, to reduce cost, years ago began to seek for methods of milling which would permit an increase of stamp duty. Year after year saw the stamp-duty increased by various ingenious means, until now, by coarse crushing and re-grinding, the capacity per stamp, as at the East Rand mills, for instance, has reached 20 tons daily, and even a higher rate is anticipated, as compared with that of 4 to 6 tons per stamp in the average California mill. That the gold ores of California are mostly readily amenable to the simple methods of recovery practised on the Rand is well known, and why California millmen do not make an effort to increase mill capacity along lines similar to those that have been successfully evolved on the Rand, is one of the things not easy to understand. An increase of stamp-duty without any material increase in the cost of power will certainly result in a decrease of milling cost per ton. At many California mines, by adopting the re-grinding methods of the Rand, employing Chilean or tube-mills after coarse-crushing in the stamp battery, the capacity could be raised from 4 or 5 tons per stamp to 10, and possibly to 15 tons, per stamp daily, while making as large a saving as by present methods. It seems well worth the effort, at any rate, and if the attempt be successful it would permit a stated capacity at a much lower capital expense for equipment.

Costa Rica Mineral Resources

By Lee Fraser

Geographically, Costa Rica may be most readily fixed in the American mind by its close proximity to Panama, being the southernmost of the five Central American republics, including Salvador, Honduras, Guatemala, and Nicaragua. In population, Costa Rica will probably not exceed 370,000, while its area is approximately 18,000 sq. mi., giving a density in population of about 20 per square mile. Compared with its sister republics, Costa Rica ranks last in population and second to last in area. On October 2, 1502, Columbus, then making his fourth voyage, landed on the shores of Costa Rica, and there founded a colony. Hostile Indians later destroyed the settlement and so successfully resisted the subsequent encroachments of these Spanish adventurers, that not until 1565, under Coronado, with the assistance of Las Casas, were they subjugated to the Spanish rule. In turn, Costa Rica was incorporated with Guatemala, to form a part of the Vice Royalty of New Spain. Between 1810 and 1821, revolutionary movements sprang up in Costa Rica, but were suppressed, under the Spanish Crown, until their culmination in the Declaration of Independence of the Central American States of Guatemala, on September 15, 1821. From that time the political history of Costa Rica is a story of events gradually leading up to her withdrawal from the Federation of Central American States on April 1, 1829, and the proclamation of her constitution on January 21, 1847, followed later by the proclamation of the present constitution, on December 7, 1871. Up to and including the time of the formation of the Federation, the course of the Central American States presents marked analogy to that pursued by those States which formed the nucleus of our present growth. But subsequent to that period, we see the disintegration of the Federation and final withdrawal of each State, and in this phase of Central American history we may read much of the character of its people. The question as to why no confederation of States was formed and maintained is indeed an interesting one, both from an ethnological and sociological point of view, but its further consideration may hardly be introduced into this article.

To almost everyone, foreign to the Latin American countries, their politics seem to be a *bete noir*, of such hideous and immense proportions as to preclude any chance of existence in safety, or holding of property in security, while within the borders of the territory it rules. But here one may take solace from the fact that most writers omit Costa Rica from the category of those countries infected by bad politics, and in view of the fact that scant information seems to be available concerning the laws and general conduct of government in Costa Rica, a short discussion on the subject would seem at this point permissible.

The several branches of the Costa Rican Government are altogether similar to those of other American republics, for all of their constitutions have been generally modeled after that of the United States. The congressional body is composed of a Chamber of Deputies, elected indirectly, by electors chosen by popular vote, and in the per capita ratio of 1 for 8000, or a fraction over 4000. One-half of Congress is renewed every second year. Five deputies comprise a permanent committee to which is delegated various powers. For instance, the committee takes the initiative in promoting new legislation, in the rearrangement of business, the formulation of decrees, bills, and similar legislation, all of which is subject to the approval of Congress in session. The President is elected indirectly by the people for a term of four years, and may not be re-elected to a consecutive term. In his deliberations he is assisted by a council and the committee of five deputies, the council consisting of a cabinet of four members, and any other appointed by the President. The federal powers lie in the supreme court, two courts of appeal, with civil, criminal, district, municipal, and justice courts. The supreme court is appointed by Congress, which in turn appoints the justices of the lower courts. Each of the seven political divisions, consisting in the provinces of San Jose, Heredia, Cartago, and Alajuela, and the Camarcas, Limon, and Punta Arenas, are administered by governors appointed by the President, who in turn recommend for appointment the chiefs of the cantons and districts and municipalities. The chief source of revenue of the Government is the import taxes, and additional revenues are gained from exports, monopoly and manufacture of liquor, and sale of public lands. Aside from the taxes levied by the municipality no property taxes are collected, with the exception of a small road tax. Mining machinery and supplies are admitted free of duty upon application. The mining code is liberal and perfect title to land and minerals may be easily acquired. The general mining code, it is reported, is about to undergo revision.

As elsewhere in the tropics, the difficulties of transportation greatly retard the development of the country's natural resources, to a greater extent than any other factor. Conditions now will be greatly ameliorated by the completion of the railroad from San Jose to the Pacific port of Punta Arenas, thereby giving a direct road from the Atlantic to the Pacific. Internal communications are accomplished by about 400 miles of railway, 1200 miles of telegraph lines, connecting with foreign cable lines and wireless stations at San Juan del Sur and Limon, postal service, and a fairly complete quota of roads and bridges. From the Atlantic seaport, Limon, a 36-in. gauge railroad extends 103 miles into the interior to the capital of the country, San Jose, at an altitude of 4700 ft., first passing through the ill-fated city of Cartogo, at an altitude of 5250 ft. About 330 miles of railroad terminate in Limon, almost two-thirds of which is used solely in the transhipment of bananas. The Costa Rican Government operates the line from San Jose to Punta Arenas, and from Punta Arenas to Esparta. Away from the railroad freight must be handled either by ox-cart or pack-mule.

At the close of the Cretaceous period is placed the

time of the upheaval of the sea bottom into land, forming the connection between the North and South American continents, and giving, at its immediate conclusion, a north-south trend to the continent. During the following Miocene epoch the country was subjected to magmatic intrusions. Simultaneously there occurred a shifting of the structural trend of the continent from a north-south to a north, 40° west, course, the new folds developing across the old north-south folds. The active forces, judging from the results produced, would appear to have expended their greatest energy in producing the movements throughout Mexico and the north, expiring in their last paroxysm to form the southernmost end of Central America, and to connect it with the southern continent. Subsequent to its formation, Costa Rica has undergone rapid and extensive erosion, upon both the Atlantic and the Pacific slopes, but more especially on the former, and under the disintegrating action of heavy rainfall and the growth of abundant vegetation, the highlands have been worn away to form with their waste, the plains of Los Guatusos, San Carlos, Santa Clara, Tortuguero, and the low-lying costal plain. Upon the Pacific slope the erosion has been less intense, and we find only the valley of the Tempesqui river approaching in extent the plains of the Atlantic slope. The country, drained by both El General and Grande rivers, is rugged and broken, suggesting a long period of erosion, before complete degredation to base level can be reached. In general, then, the topography of the country is decidedly broken and uneven, each stream and river having but commenced to seek its rest at sea-level, and in its turbulent effort to arrive at its time of repose, it is leaving behind it innumerable hills, ridges, and mountains in picturesque confusion.

City of San Jose, Costa Rica, Central America.

Shaft at Mine, Costa Rica.

Ancient Ornaments Found in Burying Ground.

In the light of present knowledge concerning the subject in Costa Rica, it appears that the deposition of minerals from intruding magmas, either by solutions emanating directly from them, or by direct intrusion of veins, was in no way extensive, if not of extremely rare occurrence. Numerous veins of quartz exist, but their origin, in all cases which have so far come up for consideration, may be considered

as closely related to metasomatosis which was followed by secondary enrichment. From a large number of veins examined on the Pacific slope an average strike was observed as N.30°E., while occasionally veins are observed striking S.60°E., or practically at right angles to the former and parallel to the structural trend of the country. Costa Rica has been and continues to be a region of continued seismic disturbance; the movements occurring, no doubt, along planes at right angles to or parallel with the tectonic trend. Then along these planes of movement the profuse circulation of the surface waters, so abundant in tropical countries, will in turn deposit vein-forming materials, with possible enrichment by minerals leached from the country-rock, for which cycle, conditions at the present time are, no doubt, as favorable as at any time in the past.

The known occurrences of minerals in Costa Rica are not numerous as compared with those reported in the nearby and adjacent republics, but, to the best of my knowledge, are given below. The Rio General district is undoubtedly a country of great agricultural and, presumably, mineral wealth, though nothing has been done to exploit it. In the river valley are a number of old burying-grounds which have given up several thousand dollars in gold idols, images, and various implements. The known occurrences of minerals in the Rio Grande district and the country lying to the north are more numerous, due to the fact that a large portion of the inhabitants of that country actually occupy the land, and not necessarily because there is more mineral in that region.

In regard to the Talamanca district, which comprises the southeast corner of the country, it is of interest to note the findings of W. M. Gabb, who was sent by the Costa Rican Government in 1874 to re-discover mines of fabulous richness supposed to exist in that district. He declares that such mines do not, and, for sufficient geological reasons, can not exist there. His instructions required him to look for mines, and he examined carefully for traces of the precious metals wherever he went. He found in a few places quartz veins, one of considerable size, others practically valueless, and also deposits of placer gold in a few localities, but he says the existence of gold is rather of scientific than economic importance. The gold occurs in the metamorphosed Miocene rocks, and always at a distance from the granites. The point at which he found gold nearest to the granite was at least a mile distant, although the rock was highly metamorphosed. The spot where he found the largest quantity of gold was miles away from granite. The base metals, oil, and coal have never received much attention, and aside from the fact that indications of their occurrence have been observed, but little information regarding them is to be obtained.

DISTRIBUTION OF MINERALS

Atlantic Coast: Cuartos Esquinas, black sand; Puerto Limon, natural cement; south of Puerto Limon, black sand; Puerto Viejo, black sand and gold; Rio Zhorquin, gold in sands; Rio Uren, gold in sands at headwaters; Rio Cuculis, coal; Rios Coen and Suagbli, oil; Rio Zent, copper; Montana Matina, coal; Calobozo, iron.

Cartago: Paraiso, copper, gold; Orosi, copper, gold, silver; El Copey, gold.

South of Rio Grande and north of Cerros del Puriscal, there are many occurrences of gold, lead, silver, and copper throughout the region.

San Ramon, Naranjo, San Mateo, and Esparta, Tuccares, and the Guacimal, Aranjues, Largatos, Abangarez rivers, gold, silver, lead, zinc, iron.

Laguna Tenorio: iron, gold.

Guanacaste, Sardina: asphalt, manganese, copper.

Actual mining operations for gold are being conducted by the Abangarez Gold Fields of Costa Rica, the Montezuma Mining Company of Costa Rica. At the La Union mine, the property is being developed, and some work is being done by the Aquacate Mines in re-opening some abandoned properties near San Mateo.

FAIRBANKS DISTRICT, ALASKA

The estimated value of the gold output of the Fairbanks district, Alaska, in 1910 was $6,100,000; the value in 1909 was $9,650,000. This falling off is due to the facts that many of the richest placers have been mined out and that no effective work has been accomplished toward mining gravels of lesser value. Plans for dredging some of the shallower creeks have been made, but nothing tangible has been accomplished. Meantime many of the most enterprising operators have turned their attention to prospecting auriferous quartz veins. Here, as in Seward Peninsula, there are large bodies of auriferous gravels whose gold content is too low to permit its recovery by the methods now in use. There was a scarcity of labor at Fairbanks in the spring, owing to the exodus to the Iditarod, and on some of the creeks the water supply was inadequate. These conditions also affected the gold production to a certain extent. It is estimated that about 130 placer mines were operated in the Fairbanks district during 1910; this is a falling off of over 50% from the average of previous years. As the gold production has declined only about 35%, the output per mine has increased. An average of about 1200 men were employed in this production through the year. Among the new developments were the operations on Fish creek, where little mining had been done previously. The pay-streak on Goldstream creek was also traced farther downstream. The most extensive mining, as in 1909, was done on Goldstream creek and its tributaries, Pedro and Gilmore creeks. Second in importance were the operations on lower Cleary creek and on the Chatanika flats. Fairbanks creek was also the scene of much mining. It is estimated that 20 claims were worked on Fairbanks creek, 13 on Ester creek, 8 on Fish creek, and 10 to 15 on other smaller creeks.

It is interesting to note the recent discovery of scheelite in Halifax county, Nova Scotia. The ore is reported to yield 60% tungstic acid. At present 25 men are at work.

Mine Accounting

By L. A. Whittaker

After several years' experience in mining offices, mostly in Mexico, it is evident to me that the right kind of attention is not generally given to the subject of accounting by the smaller mining companies. A mining engineer must be equipped with certain standard training before he can expect to hold a responsible position in his profession. The attaining of this costs him much hard work and study and he should realize to what extent the demonstration of his ability depends upon his office staff. Among these smaller mining companies there are many engineers who, on account of a difficult, or maybe impossible, condition, are not making favorable showings to their stockholders. It may be that they are doing excellent professional work, but usually the verdict of small investors is based only on the profit and loss sheet. When such an engineer can put before his directors and stockholders a simple and intelligent statement, showing every detail of what he is doing, and minutely accounting for all funds, his reputation as an engineer is benefited. It would naturally be thought that such a statement could be readily prepared, but the common lack of easily understood and comprehensive systems of reporting these details is working an injustice to engineers.

The book-keepers and accountants employed by the ordinary mining concerns are often men who have gained their knowledge of books in industries other than mining. This is accounted for by the fact that men of this class are more liable to seek employment in cities than they are to 'rough it' in mining camps. There is no other industry which undertakes as many different kinds of business as is carried on through the office of an isolated mining company. The officeman, therefore, to do his work thoroughly, must have a broad knowledge of industry, which can hardly be gained with any city firm handling one line of business. A competent city book-keeper has a great deal to learn before he can give the best results as a mining accountant. Especially in Mexico, but to some extent in the States, an officeman must be posted on the commercial and mining laws of the country, and his failure to so equip himself will sooner or later cause his company trouble. A manager's duties take him away from his office so much that he should test his accountant's knowledge in this line.

The 'working costs' of mining are prepared in such a variety of ways, according to the ideas of the engineer or the guesses of the accountant, that it would seem desirable to have some standard established for this work. Since an engineer's ability is judged by his 'costs,' he must realize that his accounting department needs the same skilful supervision that is exercised in his operating departments. An investigation shows that in too many cases this work is not understood as it should be. If an officeman has not a working knowledge of all the details of the mining business, he is liable to make errors in his distribution of expenses, and a cost sheet which is not accurate is useless. If a manager must make mental allowances for this inaccuracy and that arbitrary entry, he is losing the value of the money expended in making the cost sheet. In this branch of the work a mining accountant is distinct from a bookkeeper. He must use judgment based upon a thorough and intimate understanding of all the departments of his company, and he should realize the responsibility that is his in seeing that each department is fairly dealt with and that his manager can depend upon the report. If any good is to be gained from a 'cost sheet' the costs must be calculated promptly at the close of each period so that the manager may be able to make such changes as its figures may indicate are desirable. Quick work is the keynote of mining accounting. And, finally, the sum total of the cost sheet for any period should balance with the ledger for that period. This remark may seem superfluous, but it would be interesting to note the number of cost sheets that are independent of the financial sheet for the same period, and do not show the same total. Naturally, explanations can be given for these differences, but the ideal manager's report is one in which no explanations are necessary.

For the benefit of young mining engineers and those connected with the smaller mining companies a standard method of accounting should be established. The business conducted by the different railway companies throughout the United States is probably as varied and involves as many distinct branches and departments as that of the quartz mining companies. Yet the railway companies have established a standard method of accounting and the costs on all our railways are arrived at in exactly the same way. One superintendent's ability can be readily compared with that of any other. The Interstate Commerce Commission, acting for the railroads, has published a 'Book of Accounts,' which is used by all the railroads. This book covers every possible receipt or expenditure that may occur in the railway business. A standard system of account numbers is used, the business being divided into departments, and the departments subdivided into the different accounts. The book explains minutely what items should be charged to each account, and the accounts are explained so clearly that no room is left for difference of opinion as to any particular charge. An inexperienced clerk can, with the aid of this book of accounts, make a proper distribution of the expenses of his department. Naturally railway clerks become familiar with these account numbers, and their changing from one company to another does not detract from the value of their services. Mining engineers could get up some such a system of standardized mining accounting, and I believe its operation would be satisfactory to all concerned. The system would not leave the important matter of costs to the judgment of the accountant, but would give him a definite basis for all his work.

Zinc amalgam, made by dissolving strips of metallic zinc in quicksilver, forms an excellent dressing for mill plates that require frequent care.

Indiana Oilfields in 1910

By Raymond S. Blatchley

Trenton Rock Oil District.—The old Trenton Rock district, covering the greater portion of northeastern Indiana, has declined so rapidly in the last six years that it is gradually losing its place as an oilfield. In the past, more than 25,000 wells have been drilled, yielding gas under phenomenal pressure, and a large production of high-grade oil. The greater number of gas wells have long since been abandoned and new gas wells are now seldom drilled. About 9200 wells have been plugged and abandoned since the first of January 1905, and these with about 8000 dry wells in the field leave some 7800 bore-holes that are chiefly light oil-producing wells. There were 431 wells abandoned in 1905, 1063 in 1906, and 1501 in 1907. The number abandoned since is given by months in the table below. The greatest number has been abandoned in Wells, Grant, and Deleware counties. The cause of such abandonment lies mostly in the decline of the gas yield, which served as a basis of power for pumping.

The new development in 1910 was slight. About 125 wells were drilled, of which 25 wells or 20% were dry. The new production for the year only reached about 1200 bbl. It is interesting to note the decline in the Lima, Ohio, Trenton fields, which is a continuation of the Indiana area. Since 1905 about 6850 wells have been abandoned. The figures for various years are as follows: 1905, 674 wells; 1906, 1059; 1907, 1357; 1908, 1135; 1909, 1127; 1910 (11 months), 1299; giving a grand total of 6651.

Southern Indiana Oil District.—The major development in southern Indiana took place in Pike county in what is known as the Oakland City oilfield, named after a town near the field but in Gibson county. There have been 269 wells drilled, of which about 245 were completed in 1910. Of these 35 were dry, 17 yielded gas under good pressure, and 217 produced oil. The oil and gas were found at a depth of about 1100 to 1220 ft. I recently made stratigraphical comparisons of the logs of this field with those of the main oil areas of Illinois, for the Indiana Survey, and found that the oil and gas horizon lies in the Chester formations of the Mississippian series of rocks. The Oakland City sand is comparable to the Kirkwood sand of Lawrence county, the Benoist sand of the Sandoval, Marion County area, the Lindley gas-sand of the Greenville, Bond County field, and the Sparta sand of the Randolph County oil territory, all of Illinois. Considerable new development is planned for the area. The Gibson County, Indiana, field lies several miles west of the Pike County wells. The pool was defined several years ago and but little new development has taken place. The oil is found at a depth of about 850 to 900 ft. and comes from the massive Pottsville sandstones comprising the lower division of the Pennsylvanian rocks, and overlying the Chester formations of the Mississippian. Both oil areas of Gibson and Pike counties lie within the Eastern Interior coalfield. The following table compiled from the *Oil City Derrick* gives the combined new development, by months, of the Princeton, Gibson County, and the Oakland City fields:

Mining in Cripple Creek District

By William H. Storms

There are several things about the Cripple Creek district, of Colorado, that at once impress themselves upon the stranger. One of the first is the situation of large mining plants upon the very summits of a number of the highest hills; the town is at an altitude of about 9500 ft. Another is the

El Paso Shaft, Cripple Creek.

tremendous size of the waste dumps, many of them held in place by cribs of timber hundreds of feet in length in which are thousands of logs, suggesting the great expense incurred in hoisting these millions of tons of worthless rock, the great additional cost for timber and labor expended in building the cribs to maintain the dumps in position on the hillsides, and the reflection that a different method of mining, in many instances at least, would have saved much of this expense, which might have been added to the profits of mine owners and lessees. Still an-

The Elkton Mine, Cripple Creek.

other matter to attract the attention of the visitor is the ramification of the electric-car lines. They seem to run everywhere. The tracks, usually on heavy grades, sweep around the smooth hills from base to summit, curving to right or left almost constantly, winding their sinuous way through rock-cuts or over curving trestles, some of which are over 100 ft. high. There are said to be over 72 miles of railroad track in the district, and I do not believe there is 5 miles of railroad track on a tangent in the entire railroad system. Electric cars run at frequent intervals night and day, to, or near, all the important groups of mines. The larger towns are Cripple Creek, Victor, and Goldfield. These latter are three to four miles from Cripple Creek in a southeasterly direction, Goldfield being less than a mile northeast from Victor. Near the latter town are the Portland, Stratton's Independence, Granite, Strong, and some less prominent mines, and near Goldfield the Golden Cycle and Vindicator are the most important operating properties. Near Altman are the Pharmacist and Zenobia mines; a settlement has grown up on the northwest slope of Raven hill, near the Anaconda mine, and still another between the Cresson and the Elkton mines. Although Cripple Creek came into existence 19 years ago, it has lost little of its interest, for new and unexpected discoveries continue to be almost daily events. The present efforts of mine superintendents and managers in the Cripple Creek district are being directed toward the introduction of methods of mining which will permit a lessening of mining costs; the closer sorting of ore, and the elimination of unnecessary expense in ore-handling by the employment of automatically operated conveying devices —these latter above ground. At the same time, they are seeking the least expensive means of ore

Logan Shaft, Stratton's Estate Co., Cripple Creek.

treatment with highest extraction, whether it be in local mills owned by some of the mining companies, such as the mill of the Stratton's Independence, at Victor, and the large new mill of the Portland company on Battle mountain, or in those at a distance, as that of the Golden Cycle company at Colorado City, and of the Portland company near Colorado Springs. By far the greater number of mines, however, have no reduction works, and these ship to either custom mills or to smelters. The Standard mill at Colorado City is the largest milling plant in the State operating exclusively on custom ores, though the mill of the Golden Cycle company, near it, also buys ores. Competition between the mills and smelters is very close, and has resulted in repeated cuts in treatment charges during the past ten years. A material cut has only recently gone into effect in all of the reduction plants handling custom ores, which will make available a still lower grade of ore than has been profitably treated heretofore.

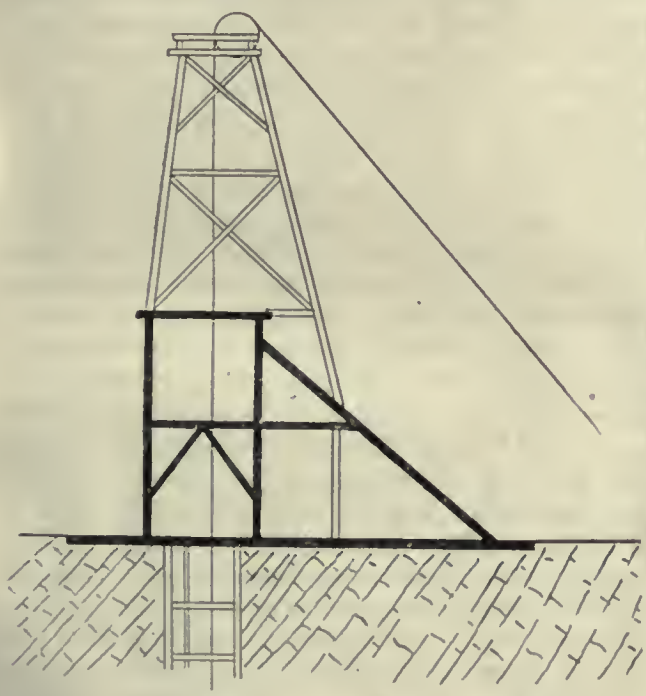
To the stranger, Cripple Creek presents the appearance of 'having seen better days'. This is true, too, for there are many idle mines, some of which are equipped with expensive mining plants. Many

buildings show signs of dilapidation, and the population has been reduced by many thousands. There are several causes for this comparative stagnation of the mining industry in Cripple Creek, the first being a temporary indisposition of capital to invest in mining in this district, influenced to a great degree by the labor conditions which existed here a few years ago, and which made it unsafe to invest largely in an enterprise that any day might be forced to suspend, due to the possible action of organized labor. The district still feels to a noticeable extent the baneful effect of those unfortunate days, though it is slowly overcoming this feeling of insecurity, and new enterprises are being started with great promise of success.

The larger number of mines of the district, including many of the most important ones, are being operated by groups of lessees. Indeed, this has always been a notable feature of mining in this district. Some of the leasing companies are incorporated and operate in essentially the same manner as the corporate companies operate their own mines. However, most of the leases are individual or partnership affairs, or associations of a few practical miners, who, under contract with the owner, prospect certain defined blocks of ground, develop and mine the ore, if any be found. The leases of this class contribute a very large part of the total tonnage of the district. Many of the lessees are men of limited means, and this fact has led to the introduction of the least expensive equipment, the utilization of crude structures, and the adoption of the makeshift in many directions, particularly on the surface; but the experienced lessee is a man who knows how to economize underground as well, and he operates his lease at a tonnage cost which corporate management can seldom, if ever, duplicate. The lessee rarely does anything that costs time or money without some direct object in view. He is unhampered by a finical board of directors; not weighted down by expensive engineering staff, nor by elaborate office equipment, with large clerical force. In fact, he is usually free from all the extraordinary expense incident to corporate management of mines, and devotes his entire time, attention, and energy to mining ore as rapidly and as cheaply as is consistent with present safety. The subsequent result of this policy of 'rigid economy' is seen in the surface subsidence of ground over mine workings, throughout the district, resulting often in the distortion of buildings, and other similar surface damage. The lessee builds surface structures generally innocent of what are considered essential engineering features, but they serve the purpose, and sometimes, if he is prosperous, he enlarges on the original plan by making striking additions, as evidenced by the accompanying sketch of a head-frame on the Whisper mine of the Gold Sovereign Co., near the Logan shaft of the Stratton's Estate Company.

Another condition which for a year or more past has retarded deeper development of the district has been the problem of handling the ever-increasing amount of water found in most of the deeper mines. In its comparatively early history, water became troublesome in many of the larger mines. The first water encountered in the mines of the district was in the Blue Bell adit near Anaconda. This stream ran for a long time at the rate of 200 gal. per minute. Several other adits, at various levels in different parts of the district, which were driven to develop ore, proved valuable as drainage conduits for the mines of their immediate vicinity. The first adit driven with a view to mine drainage as well as development was that known as the Standard tunnel. This was commenced in 1896, its objective point being the phonolite intrusion on Beacon hill. When the El Paso vein was cut, a flow of 250 gal. of water per minute came into the workings, which increased to 1000 gal. per minute when the phonolite was reached. The rate of flow further increased as the heading advanced. It was completed in 1899, and drained most of the mines of Beacon hill, Gold hill, and Raven hill, to its level. The benefits of this drainage tunnel were so apparent that it was soon determined to drive another at a lower level, and the first El Paso tunnel was started at a point nearly a mile southwest of the El Paso shaft. Work commenced in January 1903, and was continued until September 6 of the same year, when a connection between the two portions of the adit was made. This work was carried on with three headings: two from the El Paso shaft and one from the Cripple Creek portal. The flow of water from this adit was 2500 gal. per minute, and numerous deep mines of the vicinity were rapidly drained to levels deeper than their lowest workings, permitting the resumption of mining in these deep levels. This drainage adit was continued toward the Elkton and in time completely drained the mines lying in that direction to its own level. In time, mining operations, which were again vigorously prosecuted, had removed most of the known ore above the drainage level, and a new and still lower adit began to be discussed, as pumping or bailing was economically impossible. This new need resulted in the driving of the third drainage adit, called the Roosevelt tunnel. To accomplish this great work a corporation, known as the Cripple Creek Drainage & Tunnel Co., was organized in August 1906, and money was raised through subscription by the mines to be most greatly benefited. Work was commenced in May 1907, and was carried out mostly under contract by A. E. Carlton. Three separate subscriptions were necessary to complete the undertaking, the first being for $388,500, the second for $126,166.63, and the third for $26,000, making a total of $540,666.63. The adit was completed as far as the El Paso, where a lateral was run under the shaft of that mine and a raise driven 340 ft., the connection being made in November 1910 by means of a drill-hole. When the connection was fully completed the level of the zone of saturation of the vicinity began to subside rapidly. What the average rate of subsidence will be found to be is not yet fully established, although during the first month it was 12 ft. in the Elkton workings, and about 2 ft. in the Portland, which lies about a mile beyond the

Elkton. This rate of fall can not, however, be considered as an average, nor as even approaching it, for while the rate of subsidence will naturally be less at a distance than near the point at which the adit cuts the formation, the rate of subsidence will decrease with the constantly lessening hydrostatic head. In addition to this, there are certain rock masses and zones of rock which are more porous than others, and there are seams of clay, or of impervious rock strata, which will hold back millions of gallons of water until penetrated by underground workings. All of these factors, and probably others, will have a material bearing on the rate of subsidence of water in the district affected by the tunnel. However, enough has been learned from past and more recent experience, and from present conditions in the district, to indicate that the fall of



Lessee's Head-Frame on Whisper Shaft.

the water will be sufficiently rapid to make it possible to resume deep mining in many of the deepest flooded mines, at points below the old water-level. The new drainage adit cuts 740 ft. below the previous water-level of the mines, and mining engineers of Cripple Creek district are unanimous in the opinion that the enterprise was one of the wisest yet undertaken in the region. In fact, deep mining without it had generally become economically impossible. In the original design the form of the drainage tunnel was that of an upright rectangle. This form was changed by A. E. Carlton, the contractor, to a horizontal rectangle to facilitate drilling and progress. A single horizontal bar was used, on which was clamped three machine-drills. Much of the rock was extremely hard, but progress was rapid, nevertheless, for organization was perfect.

The beneficial effect of the completion of this last drainage adit is being daily demonstrated and it is confidently expected that the output of the Cripple Creek district will show a decided increase as the direct outcome of this project.

AN EARLY CYANIDE PLANT

One of the first, if not actually the pioneer plant to treat ore on a commercial scale by the cyanide process, was built near the Calumet mine in Shasta county, California in 1891, by A. B. Paul. It was thus described in the *Mining and Scientific Press*, in the issue of October 3, 1891.

"The plant is intended solely for the working of the McArthur-Forrest process, not alone on the ores of the three counties for which the company owns patent rights, but for all the ores that may be shipped from all portions of the coast. The plant will treat 10 tons of ore every 24 hours, and is so arranged that different lots of ore can be treated at the same time. In the treatment of the ore, the first operation is drying. It is then passed through a rock-breaker and into bins, from which it is fed into a Paul barrel-pulverizer, and when powdered the ore is placed in agitators and a 1% solution of cyanide of potassium added. After an agitation of 6 to 12 hours the liquor is drawn off into filtering tubs. These filters are of wash-gravel covered with canvas. The liquor passes through the filter and into storage tanks. From this the solution is drawn into a chest of zinc filters, each filled with zinc shavings. The liquor flows down through the first (box), up through the second, down through the third, and so on, to the end of the eight filters. The gold is precipitated upon the zinc shavings in the form of a brown powder. When desired, the chest is unlocked and the zinc shavings washed in clear water, which separates the gold. When it has settled, the water is drawn off and the gold, in the form of brown powder, melted into bars. The liquor from the filtering tank is pumped back to the first tank and sufficient cyanide of potassium added to bring the solution up to the original 1%. As will be seen, the process is very simple, no roasting of ores is needed, and no high-priced chemicals required, with a very small loss of materials used. * * * As numerous parties have failed in making small working tests of this process, it may not be amiss to state that very often cyanide of potassium is not more than one-half to two-thirds full strength, and it is therefore necessary to know the exact percentage of cyanide as well as to follow the company's method of treatment."

This is one of the first articles descriptive of the cyanide process ever published in a technical journal. The details given are sufficiently comprehensive to make the operation of the process easily understood, as far as knowledge of it went, but subsequent development of the process proved it to be far from the simple application of a long-recognized fact—that a weak solution of potassium cyanide would dissolve gold. Since that time, the fall of 1891, tons of literature of the highest type of classical contributions to metallurgy have been published, and experimenters are still earnestly engaged in the study of methods by means of which the process may be still further improved and its commercial application successfully extended to the treatment of those ores which are still refractory.

Losses in Hydraulic Mining

By Charles S. Haley

The average quartz mine engineer, or even the average gravel-dredging engineer, in my experience, is inclined to look with indulgent pity on the efforts of his hydraulicking brother to secure what is generally regarded by the former to be an unsatisfactory, or even poor, extraction of the value in the ground which he works. When a man talks about getting an 85 or 90% return in hydraulic mining, one who has had any experience at all in that line knows that either conditions were exceptionally favorable with respect to the character and weight of the gold, and the lay of the channel from which it was extracted, or that he does not really know much about it. This is only the case, however, in ordinary hydraulic mining, where the entire bank, including the top, can be run through the boxes, at a rate sufficient to pay adequate returns on the investment. Drift mining, like dredge mining, is quite another matter. The bane of the hydraulic man is the loss of the fine and flaky gold. After several thousand dollars has been spent in getting water on the claim, and after the time spent in removing the top, the average mine must depend to a great extent on getting most of the value which is disseminated through the entire gravel bank, as well as the thin streak of bedrock pay which is usually heavier gold. It is of some of the more common ways of saving, and incidentally of losing, this value, that it is my intention to treat. There are various ways of making sluice-boxes. In the larger mines in California, with box widths of 4 to 6 ft., railroad iron is used for riffles. The smaller operators, however, from whom comes the great bulk of hydraulic production of the State, with boxes averaging about 3 ft. in width, use fir blocks for riffles. These are ordinarily separated one from another by cobbles, with lining-boards to hold them down. In the fitting in of these blocks lies the cause of a great deal of grief.

In a box of the latter size named, a space of the width of a man's hand, or about 4 in., is commonly used. The blocks should be so wedged with the separating stones as not to fill up too much of the riffle space, and while firm, to keep them well apart. Care must be taken in having the blocks uniformly sawed. In the case of semicircular blocks, the sap side should be turned up-stream, so that side will be exposed to the most pounding of the boulders, for if the pith side were turned up-stream, they would soon be beaten into the condition of brushes, forming an excellent lodgment for fine gold and thus making it extremely risky to use them for the tail-end of the boxes when somewhat worn. All blocks are burned when worn out, and the ashes panned. On cold winter nights one can pile them on the fire and feel truly economical, in view of the results in the ashes in the morning. Before the blocks are put in at all, the last crack and seam in the boxes is calked with soft wood, and all the bottoms carefully planed. Otherwise when one goes to gather the amalgam, he comes to grief. Well seasoned blocks are usually preferred, as they last longer than green, but the latter are all right while they last. After the blocks have begun to wear, fresh ones are usually substituted at the upper end of the string first. The head of the string is usually left free of quick, to avoid the expense of retorting the heavy gold.

A long string of boxes is an advantage in saving fine gold, but hardly sufficient to make it worth while cutting bedrock to place them, unless the rock is very soft. The average grade of boxes of this type is from 5 to 7 in. to each 12-ft. length of box, according to the dump facilities, but it is sometimes necessary to worry along with a 3-in. grade, and a 9-in. is sometimes used to advantage. Outside of these limits, it is hardly safe to go. The boxes are usually made in 6-ft. lengths, for convenience in placing. Having equipped the boxes properly, the next thing is the undercurrent. In all mines where there is enough fine gold to make its saving worth while (and that means most hydraulic mines), an undercurrent, and often two or three of them, will pay for their cost and the trouble of cleaning them up, ten times over in a season. A grizzly of about 1-in. steel bars, set 2 in. apart, and about 2 ft. long, is set in the bottom of the box, on a level with the top of the blocks. All the large material goes over the grizzly, and the fine gravel, carrying with it most of the fine gold, drops between the bars upon the undercurrent. This is simply a box about two or three times the width of the main string, though much more shallow, as a rule, the blocks in it being but 2 or 3 in. thick, whereas the others are 10. A good part of the water is turned from the main box through the grizzly bars into the undercurrent, which runs at right angles to the main string. With the momentum which the heavier rocks have at the time that they reach the grizzly, however, it does not take so much water to carry them on out, a somewhat heavier grade being provided where possible.

The fine stuff spreads out fanwise on the undercurrent, and the velocity is lessened considerably. Also, the local eddies formed around the larger boulders are here absent. As a result, the fine gold gets a much better chance to settle here. With a short string of boxes an undercurrent will sometimes save from a third to half the entire clean-up, and with a long string it will save gold that the boxes would not otherwise stop. Many undercurrents are made without blocks at all. One of the simplest methods is to cover the bottom with brussels carpet. An improvement on this is to tack down 'chicken wire' (galvanized wire of about 1-in. mesh) on top of the carpet, so as to 'tuft' it and make it easier for the fine gold to stop. From the great amount of fine gold carried down-river each year by the freshets of our gravel-mining countries, and from the number of people who make a living (somewhat precarious, it is true) from 'mossing', that is, getting the gold that hangs up in the tufts of moss that drag in the river when it is up, it is easily seen how the stuff is carried by muddy water, and how much an undercurrent of the type just described is likely to save. Having the boxes and undercurrent correctly

rigged up, the piper must next receive attention. If he is anxious to help lighten the labor of his brethren of the sluice-hook by letting the water back up in a pond in front of the boxes and then lifting the entire mass, gravel, mud, and all, through the boxes in a turbid flood, with one flirt of the nozzle, it would perhaps be just as well to lighten his labors by depriving him of the opportunity. This sort of thing works very well as far as getting dirt through with a limited amount of water is concerned, but as the idea is not so much to get the gravel through as to leave the gold behind in the boxes, it is hardly practicable. Every time that the current of water fluctuates in this manner through the boxes, an eddy is formed which lifts the fine gold one riffle further along in the boxes. When it reaches the 'quick,' one might think that it would stop, but it does not. Instead, amalgam and all join in the merry chase, and eventually leap joyfully into the river. This I have proved by sad experience. The small heavy gold is not nearly so hard to save as the more showy flaky gold. The latter will wend its way past all manner of undercurrents and riffles regardlessly. In examining a property of this sort, it is advisable to give this fact full weight before investing, as no method has as yet been devised to satisfactorily entrap these thin plates of gold. The utmost care should be taken where the gravel bank is fairly heavy, not to allow one's self to be blocked up by piles of boulders. Of all sources of gold loss, this is perhaps the worst. When, in the ordinary course of driving the gravel to the head of the boxes, it is unavoidable to flirt the stuff all over piles of boulders which have been left by the derrick in the path, there is sure to be a considerable amount of the gold which will never get to the boxes. Simple as this may seem, it is not uncommonly done. When one is working low ground, with not the best of water facilities for the removal of tailing, it is best to begin operations on the upper end of the claim and work down. More than one operator has come to grief through filling the river with a dam of tailing on the lower end of his claim and backing the water up all over his bedrock, so as to make it impossible to clean it. The question of theft also enters to a certain extent into sluice-box losses, as one unfortunate found who slept on his boxes one night, only to find in the morning that they had been cleaned up within 6 ft. on either side of him. As it is always necessary in a mine of any size to employ a watchman at night, it is just as well to give him a sluice-hook and put a piper with him, so as to have money coming in as well as going out. However, with the best of care, hydraulic mining must ever seem rather crude in its results to the more fastidious cyanide engineer, for instance, who lies awake at night trying to decrease a leaching cost or to perfect a slime wash to save a cent or two on a ton. Hydraulic mining, from its very nature, can never be reduced to such an exact science as the operation of quartz mines, the mechanical concentration of sulphides, or the chemical treatment of ores, by any of the various wet processes now commonly employed.

Quick Mill Construction for Fort Bidwell Mines

By Algernon Del Mar

Various writers have given the time for the erection of a small mill at from three to eight months, and I have known of some that actually took longer. I believe the erection of the mill herein described to be a record, and as there are a few points in its construction worthy of notice, a description may be of interest.

The president of the company decided upon the

Fort Bidwell Company's Mill, Modoc County, California.

erection of a 5-stamp mill on October 9, 1910, and I was authorized to purchase and erect the same in the shortest possible time, for a snowstorm in Modoc county, California, at 7500 ft. elevation in November or December means a cessation of operations in an unprepared camp until the following July. I arrived in San Francisco on the morning of October 12. Before leaving the mine, I had outlined the necessary excavations, left orders for lumber, cement, sand, and rock. I found that none of the iron works had mortars in stock, line-shafts ready, or pulleys turned. The terms of my contract made it imperative that all machinery be loaded on cars within seven days after placing the order. It was awarded to the Joshua Hendy Iron Works, and was carried out according to program. The car arrived at Reno, Nevada, on October 24.

It was reloaded on the narrow-gauge cars the same day, and on the following night was at Alturas. On November 5 all machinery had arrived at the millsite, 60 miles from the railroad. Two days later a fall of snow covered everything, and it continued snowing off and on for nearly three weeks. Nevertheless, on December 1 the stamps were dropping. The total time from the date of receiving the order to build a mill on the property to ore-grinding was 52 days; from the time of ordering the machinery, 49 days, and from the time of delivery at the site, 25 days.

The force employed was six miners, foreman, blacksmith, and two teams with scrapers at the millsite and dams. The work included building two dams, excavating for mill, laying 1500 ft. of pipe-line from dam to pump, laying 1000 ft. of pipe-line from pump to mill, erection of pump and pump-house, building of mill from hewn timbers except 1 by 12, 2 by 12, and 2 by 4.

The mill has 5 stamps, 1000 lb. each, with mortar set on concrete base, battery-posts made of 12 by 28-in. timbers set in cast-iron sole-plates on concrete base. For a mill of this size I considered it most economical for the rock-breaker to be placed on the same level as the battery with an elevator to the ore-bin. The rock-breaker is here under the care of the batteryman, for in a mill of but 5 stamps one man is easily capable of doing all the work. There are other advantages in this construction, such as, less height needed for ore-bin, no vibration from breaker communicated to bin or building, the breaker is always in sight of the millman and does not run for hours without attention, as is often the case when in the attic of the ore-bin, and the dust, if any, is at once settled on the ground instead of filtering down from the ore-bin to every part of the mill.

It was found on excavating for the millsite that what appeared to be a porphyry bedrock was underlaid by tough blue clay of unknown thickness. Ten holes 4 ft. deep were drilled into this clay, the bottoms sprung with one-third of a stick of powder, and 1-in. rods, previously upset, were cemented in and turned over at the top. The concrete was laid on this foundation. The concrete base was 9 by 9 ft., except where extended at each wing for the line-shaft. Fifty-two sacks of cement, supposedly of 100 lb. each, were used with sand and broken rock in the following proportions: for the lower half, 1 of cement, 4 of sand, and 4 of broken rock; upper half, 1 of cement to 3½ sand and 3½ broken rock.

The hold-down bolts for mortar, battery-posts, and battery-post sole-plates are all 1½ in. The bar through the battery-post is 3 in. diameter. This combination makes the most rigid battery-post I have seen, the lower part having so little vibration that it may be considered *nil*.

For foundations for battery, engine, etc., for a 5-stamp mill of this construction, it is well to provide 60 sacks of cement, 8 tons of sand, and 15 tons of broken rock. This will meet contingencies such as having to make deeper foundations than originally planned, cementing in ground, reinforcements, and other unforseen possibilities which may, and usually do, arise.

This mill, when started with new shoes and dies, crushed, as nearly as could be estimated without scales, about 1 ton of ordinary quartz per hour, through a 40-mesh screen, with 6½-in. discharge. This tonnage must be attributed to the rigidity of the heavy mortar base and concrete setting, to new shoes and dies, and, no doubt, in part to the character of the quartz.

DEVELOPMENTS IN MINING AND PUMPING

By W. A. Thomas

*In the matter of power development there is a notable tendency toward development of central energy plants for mining operations, instances being those of the Consolidated Coal Co. at Van Lear, Kentucky, with turbo-generators, condensers, and sub-station equipment; the Clinchfield Coal Corporation at Dante, Virginia, with the development of a 2000-kw. central energy plant and four sub-stations. The Homestake M. Co. at Lead, South Dakota, is just completing a 6000-kw. hydro-electric installation by diverting the Spearfish river through some 25,000 ft. of rock tunnels to a canyon, thus securing a 400-ft. head. The power will be transmitted approximately 15 miles to the mines.

The application of electricity to pumping has made remarkable advances, both in mining operations, municipal water works, and sewage plants; installations of importance being that of the Ward Shaft Association at Virginia City, Nevada, consisting of four 250-hp. completely-enclosed motors with forced ventilation by driving air first through cooling coils, then through the motors, and again through the cooling coils, the water pumped being at a temperature of approximately 145° F., 2500 ft. below the surface of the ground, and the water for the cooling coils being taken from the surface at approximately 80° maximum temperature. Another important installation is that of the Grand Rapids sewage disposal plant, to provide against flooded conditions owing to rise of water-level in the river. A very important development of the past year has been that of small self-starting direct-current motors for isolated pumping work in and around coal mines. These motors are made so that they can be connected directly across the line without injury, the advantage being that starting devices are unnecessary and the pumps can be allowed to run constantly; in the event of the circuit being opened, no injury will develop when the power is again connected to the line with the motor on the circuit. The lead of the Baldwin-Westinghouse companies in the matter of constructing steel-frame mine locomotives has been followed by others, and the past year has witnessed a great number of installations of this type of locomotive, thus reducing frame breakage to a minimum, making much stronger locomotives and permitting greater horse-power of electrical equipment on a given weight of engine.

*Abstract from *The Electric Journal*.

Tungsten and Its Occurrence

The ores of tungsten most commonly found are wolframite, an iron-manganese tungstate, hübnerite, a manganese tungstate, and scheelite, a calcium tungstate. Tungsten occurs in other combinations, but the three mentioned are the only important ores of present commercial value. The composition of wolframite and hübnerite varies greatly, but whatever the ratio of the constituent elements they each form a valuable ore when massive, or concentrated from a gangue. These three ores are usually heavy, so much so as to attract the attention when occurring in pieces large enough to form hand specimens. Wolframite has a density of 7.2 to 7.5, and hübnerite about the same. Wolframite has a hardness of 5 to 5.5. It can be scratched with the point of a knife-blade, making a dark, often nearly black streak, though the streak varies, being sometimes brownish black, yellowish brown, or greenish gray. In color the mineral is grayish black, black, or brownish red. It is occasionally slightly magnetic. Hübnerite is similar to wolframite in appearance, though usually of a somewhat lighter color, and a little softer than the latter. Wolframite fuses easily before the blowpipe flame, hübnerite less so. The pulverized mineral is decomposed by nitro-hydrochloric acid with separation of tungstic acid as a yellow powder. Wolframite is sufficiently decomposed by concentrated sulphuric acid, or even hydrochloric acid, to give a colorless solution which becomes intensely blue upon addition of a slip of zinc. Scheelite is a white, grayish, yellowish white, brownish, reddish, sometimes greenish mineral, with a white streak, and a hardness of 4.5 to 5, being easily scratched with a knife. Scheelite is also a very heavy mineral, density 5.9 to 6.1, being in this respect inferior to either wolframite or hübnerite. It looks much like feldspar, though it is softer and very much heavier. When pulverized it dissolves in nitric or hydrochloric acid, leaving a yellow powder soluble in ammonia. Fuses easily before the blowpipe. Further reactions will be found in any book on mineralogy. As to the geological occurrence of the tungsten minerals, they may be found in almost any formation, though most commonly in crystalline rocks—schists, granite, and gneiss. Wolframite is found in the Black Hills of South Dakota in coarse pegmatite granite dikes with cassiterite; in limestone with quartz, in the Providence mountains of California; in schist near Von Trigger, San Bernardino county, California, and in a similar formation near Yucca, Mohave county, Arizona. Hübnerite, like wolframite, occurs under much the same conditions and the two are often associated. One noted occurrence is that at Lead, South Dakota, where these minerals were found in quartzite. Scheelite is even more commonly distributed. It is found in granitic schist at Etolia, San Bernardino county, California; in a gold mine at Grass Valley, California; in the Cliff mine, in Virtue district, Oregon, near Baker City, where the scheelite carries gold. Tungsten ores are found in nearly all the Western mining States and also in some of the Southern and New England States. Any region of crystalline rocks, cut by numerous feldspathic dikes, is a good place to search for any of the tungsten ores.

Tungsten in 1910.—Owing to a stronger demand, the price for tungsten ores was higher in 1910 than in 1909, and the production therefore rose. The output as calculated from returns received directly from producers and millmen was the largest so far made in this country—1824 short tons, valued at $832,992. Prospecting and development, which have been proceeding more or less steadily in an increasing ratio for the past seven or eight years, have found new deposits and opened others, so that there is now a fairly ready response to market demands. The Boulder county, Colorado, field is still the largest producing section, and the Atolia, California, field is second. The ore mined in Boulder county is ferberite (iron tungstate). The Atolia tungsten ore is scheelite. The Atolia field is much smaller than the Boulder field, and gives a higher yield proportionate to area. Returns of 1221 short tons of ore carrying 60% tungsten trioxide have been made by Boulder county buyers and producers.

The production of 1910 is believed to be the largest annual output made by this or any other country to date, but the value is less than that of the output for 1907, which was 1640 short tons, valued at $890,048. Very high prices prevailed during 1907, and tungsten at one time during that year reached a price of $14 per unit (1% of a ton in tungsten trioxide). During 1910 prices ranged from $6.50 to $8.50 per unit for ore carrying 60% or more of tungsten trioxide. Leaner ores brought a lower price per unit. A little ore was sold as high as $9 or more per unit to buyers having special needs.

The production of concentrated tungsten ores in the United States since 1900 has been as follows:

PRODUCTION OF TUNGSTEN CONCENTRATE IN THE UNITED STATES, 1900-1910, IN SHORT TONS.

Year.	Quantity.	Value.
1900	46	$11,040
1901	179	27,720
1902	184	34,040
1903	292	43,639
1904	740	184,000
1905	803	268,676
1906	928	348,867
1907	1,640	890,048
1908	671	229,955
1909	1,619	614,370
1910	1,824	832,992

TIN MINING IN ARGENTINA

There seem to be possibilities of increased quantities of tin being secured from Argentina from mines now in operation in the Province of La Rioja. This mine employs 75 people, and has 2000 tons of mineral out. No tin has yet been exported from Argentina, lack of railway transportation being a detriment in mining development. The cost of transporting a ton of mineral to the seaboard from the mine referred to is approximately $25 gold, figuring on the completion of the railway line to Cerro Negro.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Avino Mines Company

The Editor:

Sir—Replying to Ralph Nichols' letter of December 2, I beg to say that I examined the Avino mines during November and December, 1898, for my clients in New York, and was thoroughly convinced at the time that the property never would be a paying proposition. My clients thereupon not only declined to take any shares, but got their friends to dispose of those they had. After the crash I had the property again examined, in January 1906, by one of my best engineers, and he could find nothing that would encourage me to take up the property and operate it. What I meant, and what I still claim is, that in undertaking to concentrate the ore, a radical metallurgical error was made, but it by no means follows that the property could have been made a commercial success by other methods.

J. PARKE CHANNING.

New York, December 23.

Metallurgical Patents.

The Editor:

Sir—Though not immediately interested, I wish to protest against the insecurity of metallurgical patents. It is a disgrace to an otherwise clean profession that the best men and the most eminent firms are the worst offenders. The chief cause of infringements is, of course, the isolation of plants which often necessitates the manufacture of apparatus on the ground and renders suit difficult. Second, probably, is the greediness of some patentees who often dare not enter upon a suit and yet put a premium on infringement by demanding excessive royalties. There seems here an opportunity for a campaign of education in the hope of bringing about a better tone. It is generally advantageous to buy patented apparatus, thereby receiving the benefit of the patentee's experience, instead of putting in a poorly proportioned, home-made affair. Further, it removes the inducement to improve metallurgical practice when a metallurgical patent is merely a joke on the patentee. N. C.

Mercur, Utah, December 23.

Cyanidation of Concentrate

The Editor:

Sir—In view of the articles and discussions on 'Cyanidation of Concentrate' appearing in recent numbers of the *Mining and Scientific Press*, the following particulars of practice at the Waihi mine, New Zealand, may prove of interest. The concentrate (from Union vanners and Wilfley tables) consists chiefly of iron sulphide with a small proportion of zinc, copper, and lead sulphides; it is shoveled from the collecting-boxes into tubs holding about 600 lb. wet weight. Care is taken to keep the concentrate under water and the product from each of the three mills is daily sent to the concentrate-treatment plant. Some 500 tons are produced each month assaying about 5.5 oz. gold and 65 oz. silver per ton. The concentrate is ground in tube-mills and delivered to spitzkasten, the coarse returning to the tube-mills and the fine passing to dewatering boxes. It is difficult to say just how fine the concentrate is crushed, but when ready for treatment it is in an impalpable condition. Agitation by air is carried out in conical-bottom tall tanks, the solution being kept at an average strength of 0.4% KCy. Time of agitation varies from 8 to 10 days. The solution is then separated by filter-pressing, and bullion precipitated by the zinc filament. No trouble is ever experienced in obtaining satisfactory precipitation. Consumption of sodium cyanide averages 16 lb. per ton: this represents a consumption of 0.25 lb. per ton of original ore. The cost, including labor, repairs, and renewals, power, transport, cyanide, zinc, flints, and sundries, is about $6.25 per ton: this represents 10c. per ton of original ore. The extraction has been uniformly good, as shown by the following figures:

		Gold, per ton.	Silver, per ton.	Extraction— Gold.	Silver
Year.	Tons.	Oz.	Oz.	%	%
1904	1,992	7.65	98.25	95.1	92.0
1905	3,719	6.65	96.35	95.5	93.3
1906	4,692	5.68	81.00	95.6	94.7
1907	5,581	5.40	66.75	95.7	94.3
1908	6,061	5.44	66.00	96.3	93.0
1909	6,339	5.60	63.30	96.3	93.5

E. G. BANKS.

Waihi, New Zealand, November 22.

Avino Mines Company

The Editor:

Sir—In the recent issues of the *Mining and Scientific Press* reference is made, by several well known engineers, to the Avino mines, of Mexico. The articles would lead the public to conclude that there are no two engineers who hold the same opinion of the property. It is to be regretted that the discussion was opened without first giving an unbiased review of its past history. Had this been done, there would have been no occasion for this contribution, the object of which is to throw some light on its earlier career. Engineers who open such discussions in the public press should remember that aside from the fact that these controversies are interesting and instructive to technical men, they owe it to their clients to confine the discussion, as far as possible, to technical matters. The public is apt to misconstrue or magnify some brief remark which would be quite harmless in technical circles. Once a subject of this nature is opened for discussion, and the financial results are publicly questioned, it remains for those engineers who have committed themselves on the merits of the property to defend themselves. In this case I consider an engineer's reputation more sacred than the profit and loss account of a corporation.

The several publications show a wide difference of opinion. Undoubtedly much of this difference

is due to misunderstanding. The opinions were derived from different viewpoints—mining, metallurgical, and financial. Furthermore, it is quite evident that some are discussing the mill ore, while others refer to the smelting ore. If all the engineers who have had to do with Avino—and they are many—could be called into consultation and instructed to make a joint report on the property, I believe some astonishing results would be disclosed. I believe that after the conference every member would frankly admit that some part of his past criticisms had been based on false impressions, or a misunderstanding of facts. I also believe that all of the mining engineers could sign a unanimous mine report, and all of the metallurgists could sign a similar metallurgical report, but I do not believe that the two classes of engineers could sign a joint mining and metallurgical report. One must be thoroughly familiar with the peculiar conditions existing at Avino to understand why I draw this distinction. The trouble in the past can be attributed directly to the mining engineers, not with their mine reports, but with their metallurgical opinions. They seem to think their mine report is incomplete unless they recommend a metallurgical process, and usually do so without even the assistance of a metallurgist; in fact, they have done so, contrary to the metallurgist's views. This policy has cost the Avino shareholders millions of dollars, because the directors are unable to disinguish between the two professions.

I first saw the Avino mines in 1896. They impressed me favorably. The property was then owned by the Diaz family. Up to that time practically all the ores had been treated raw by the patio process of amalgamation. From the Diaz brothers I gathered much valuable information regarding the metallurgical properties of the ores. They acquainted me with their experiments on certain refractory ores, whereby they found it necessary to roast with salt before treatment on the patio. Lead was of no value to them, and copper they avoided in mining. In 1899 I returned to Avino as metallurgist to the Avino Syndicate. Prior to that time the new owners had tested the ores by crushing in Chilean mills and concentrating on Wilfleys. I spent nearly a year in a 5-stamp mill, testing all the various classes of ores by concentration, pan-amalgamation, and chloridizing roasting, followed by lixiviation with hyposulphite of calcium. Concentration gave very poor results, amalgamation not much better; in fact, it was impracticable on certain ores carrying oxidized copper minerals. Lixiviation gave very satisfactory results. My report condemned concentration and strongly favored lixiviation. Contrary to my advice, concentration was decided upon, and my connection with the company ceased. After concentration had been the practice for 13 months, I returned to Avino as superintendent of reduction works. I found the mill running smoothly, but the metallurgical results were even worse than I had predicted. The resident manager gave me the following brief account of the year's work, which I will record from memory as best I can, using his words:

"You of course know that the consulting engineer instructed Fraser & Chalmers to design and equip this mill to treat 300 tons of ore per day. Mechanical difficulties have been many. The hardness of the ore was underestimated. More rolls had to be added to the primary crushing. The Chilean mills used to re-grind the jig middlings were unsuitable and had to be replaced by rolls. We have now 10 sets of 12 by 36-in. rolls to crush 300 tons per day. The design of the roll shells, with three-quarter-inch bevel, requires that the shells be shrunk on the cores. With this cherty ore the shells slip and sometimes burst. Our frequent shut-downs are due mainly to repairs to rolls. The repair costs in the crushing plant are excessive. The flow-sheet called for the 12 double four-compartment jigs to treat three sizes of feed, from 7 to 1 mm., and for the jigs to make concentrate, middling, and tailing. The middling only was to be re-ground and to join the original undersize as feed for the 12 Wilfley tables. Coarse crushing would not release sufficient of the disseminated minerals to allow of discarding the jig tailing. The re-grind equipment was not originally designed to treat the tailing, nor were there sufficient tables to treat the tonnage we were expected to put through. The failure of the mill resulted in the release of the consulting engineer. Since then the directors, as well as Fraser & Chalmers, have had several concentration experts here, and many improvements have been made. We are now treating a little under the estimated capacity, re-grinding practically all the jig tailing, and losing value in the slime. A couple of canvas-tables, now treating slime, would indicate that some success might be attained in that direction. One roasting-furnace and a few tanks are now regularly treating a small part of the slime by leaching with 'hypo' and the results from that experiment are very satisfactory."

This was the condition of affairs when the mill was turned over to me in 1901. After carefully studying the results, it was very clearly shown that the 96 jig compartments were producing silicious concentrate and consuming a lot of power and water, as well as making a very poor extraction. The plant was shut down for alterations and additions. Eight of the twelve jigs were discarded. The remaining four were cut in half, making double two-compartment machines, or a total of 16 compartments. Six large V-shaped classifiers replaced all the finer trommels. Thirty-six stationary canvas-tables, of the Dimmick type, were installed. The old and new flow-sheet, according to my memory, was approximately as follows:

	Old system.	New system.
Tonnage	275	150
Primary crushing	6 mm.	1.5 mm.
Jig feed, 3 sizes	6 to 1 mm.	
Jig feed, 1 size		1.5 mm. to about 40-mesh
Concentrate produced from jig	Bedding	Hutch
Re-grind to	1.5 mm.	About 16-mesh
Wilfley feed	Sand and slime	Sand
Canvas-table feed		Slime

The extraction was nearly doubled. The concentrate, on the whole, was less silicious. Within a

few months a point was reached where any additional extraction cost more than it was worth. We had reached the economic limit of concentration without being able to pay expenses. The plant was closed down on my recommendation, the concentration machinery removed, and several hundred thousand dollars charged off to depreciation. I recommended lixiviation. Ottokar Hofmann was sent to Avino to investigate. He approved all of my recommendations. The Board appointed Mr. Hofmann consulting metallurgist to the company. It was distinctly understood that the capacity of the leaching plant should not exceed 100 tons per day, and that in the event of the process being successful, profits should be looked for from additional capacity to be added later. The old mill and power-plant were made use of, as far as possible, and the new process started in the latter part of July 1902. With the starting of the plant, labor difficulties developed which were more important to solve than the treatment process. After breaking in the furnace crew, it was necessary to replace them with Japanese laborers for a month or so until another crew was brought in from outside districts. The labor question was serious for three months and effective for five months. July to December results show that the plant treated but half its capacity. The labor difficulties paralyzed the roasting department, where hand-stirred reverberatories were in use. Chloridizing roasting of silver-copper ore is an art which requires skill and experience. During those trying months, with new furnacemen to break in every few days, the art was not recognized. Each succeeding month gave lower costs and higher extractions. A complete clean-up was not considered advisable, on account of the impression it might make upon the labor agitators. But the value of locked-up metal was conservatively estimated and the net smelter and mint returns increased each month, giving promise of much higher results. Taking November and December collectively, an average of 48 tons per day was treated. After charging every possible expense, in Mexico, to that small tonnage, the financial books showed a loss of less than $600 U. S. currency, per month. These results were obtained from the average low-grade mill ore. They are by far the best results ever secured by the company. The company was reorganized. The new management called for a complete change of staff from consulting metallurgist to foreman. I was relieved in December, my foreman a week or so later. In January the first and last clean-up was made. It totaled far in excess of the estimates, a surprisingly large surplus of silver sulphide being found in the pressure-tanks, sufficient in fact to wipe out several months' losses. The process, in my opinion, was successful. Apparently the new management did not think so, because the plant only ran a few weeks after I left. Old and trusted employees, men in whom I had every confidence, who remained in the mill after I left, report that the calcium sulphide was not properly prepared, resulting in the 'hypo' solutions becoming very caustic, rendering the silver chloride insoluble. Whatever the cause, the process was condemned, and abandoned by my successors. Had those in charge at the time even laid any claim to the title of metallurgist, or chemist, or if they had even claimed to have had any previous experience with the process, or if they had understood the chemistry of it, their right to condemn it might have carried some weight. I still have confidence in the Avino mines, and in the success of the leaching process.

F. N. Flynn.

Clifton, Arizona, January 2.

GOLD IN PRETORIA

According to the *South African Mining Journal*, Pretoria now has a gold mine as well as diamond mines. It says: "The report of the discovery of a promising reef southwest of Pretoria brings to mind the work which has been going on upon the farm Mooiplaats, on the Hennops river, in the same direction. This property was first opened up to a small extent before the war. The occurrence is an apparently irregular body of quartz associated with diabase, which breaks through the dolomite in this neighborhood. Some wonderfully rich pannings are obtainable here and there, and a good deal of the float shows good value. As is usually the case with occurrences of that kind, however, extreme irregularity, both in the matter of value and size of vein are the leading characteristics, which militate against the chances of continuous and satisfactory mining unless a large amount of opening up is insisted upon. Owing to the high results of sampling over a comparatively small area, a 10-stamp battery was erected on the property some months ago. After a brief run, the ore supply gave out, and since that time the efforts of the manager have been almost entirely devoted to a search for the lost reef. It was reported lately that valuable quartz had again been struck."

THE BEGINNING OF HYDRAULICKING

The first hydraulic mining of which there is authentic record, was at Yankee Jim's placer camp in Placer county, California, three miles west of Forest Hill. A ditch was dug along the hillside, and from this a flume was built toward a small ravine where the mine had been opened. This flume was carried out until it had reached a point 40 ft. above the ground. Here the water poured into a barrel, to the bottom of which was attached a hose or pipe of rawhide. The nozzle was a tin pipe about 4 ft. long, and shaped like an ordinary horn, having an opening of 1 in. diam. at the end. With this small and simple apparatus, E. E. Mattison, the inventor, proved the superiority of his device over shoveling, and the idea was at once adopted and quickly improved and enlarged.

To Prevent Rust.—It is said that articles of iron or steel boiled in a solution made by adding 4 oz. of phosphoric acid and 1 oz. iron filings to 1 gal. of water, will form a black non-corroding coating over the surface of the metals, thus preventing oxidation.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Coal and gold veins do not frequently occur in close proximity, but there are instances of such occurrence.

No legal location of a mining claim can be made without proper discovery. This is the first requisite of all locations.

Vapor from cyanide of potassium is fully as dangerous as when it is in a solution. Fumes from the chemical, its dust, or solution are equally deadly.

Corundum is aluminum oxide. Little aluminum has ever been made from corundum, although a few years ago it was thought that this mineral would be extensively employed for this purpose.

Mine maps are an absolute necessity. No mine can be properly and safely operated without accurate maps, and the work should be kept close up to date, never more than a month behind, and a week is better.

A millsite cannot be appropriated on land known to be mineral. It is not necessary to own a mine in the vicinity, or at all, to 'take up' a millsite on the unoccupied public lands of the United States. Five acres may be taken for a single millsite location.

Stinkstone is the name given to some porphyries, limestones, quartz, and other rocks which emit a peculiar fetid odor when struck by a hammer or beaten together. Curiously, it is rarely that quartz possessing this peculiarity is valuable for the gold it contains.

Zincblende occasionally is found which when scratched in the dark shows a faint phosphorescent light, called fluorescence. This has been mistakenly called radium by some. Blende possessing this peculiar property is not more valuable than that which does not have it.

Work done in a placer cannot be counted as 'assessment work' done on a quartz location on which the placer occurs. The annual labor for the quartz mine must be done for the direct benefit of the quartz location, either on the vein itself, or in the solid rock, such as driving an adit or sinking a shaft to reach the vein.

A track grade of 5 in. in 100 ft. is the average on good tracks. Poorly laid tracks of light rails and heavy cars should have a heavier grade. The grade on curves should always be heavier than on straight tracks. It pays to construct good substantial tracks with well made switches. The added first cost is soon repaid in saving of time.

The Sutro tunnel was run a total distance from the portal to the Comstock Lode of 20,016 ft. The lateral branches of the tunnel are about of equal length. It was one of the greatest mine-tunnel enterprises of the world, and was accomplished under great disadvantages—mechanical, physical, and financial. It cut the Lode at a depth of 1640 ft. in the Savage mine.

By arkose sandstone is meant a sedimentary rock consisting chiefly of the essential constituents of granite. Much of the sandstone of the coast range of California is of this character. It is evidently the débris of disintegrated granite. It is in rock of this character that most of the quicksilver deposits of California occur, and are usually associated with intrusions of serpentine.

Pitch pine makes a very durable mine timber, and will not rot, but is more brash than that of a less resinous character, and therefore not to be depended upon to the same extent as ordinary pine timber. Moreover, pitch pine takes fire very readily, and for this reason is even more dangerous than ordinary pine. It is wholly a matter of opinion whether timbers in tunnel sets will last longer if placed butt end up, than if placed butt end down. It is doubtful that there is any difference.

Posts and caps for drift sets have been molded from gravel, sand, and cement, and placed in mine workings, but have thus far been in the way of experiment. Ordinarily the miner uses whatever is most convenient and least expensive at the moment, having little regard for the distant future. The far-seeing manager, however, is more likely to contemplate ultimate results, and he may see more virtue, or economy, in concrete, or steel, mine timbers than the miner who more closely scrutinizes first cost.

Miners when selling a prospect or mine, usually demand cash. A certified check is sometimes used in mining deals. Such a check is an excellent thing to have in these cases, as it is as good as money and safer. The check is guaranteed by the bank against which it is drawn, that institution holding a sum equal to the face of the check for the person to whose order it was written. This money cannot be withdrawn from the bank by the original depositor, unless the certified check be returned to the bank unendorsed.

Gold in limerock is by no means unknown. There are several occurrences of gold in calcite, in crystallized limestone, and in massive limestone in California. Gold was found in a calcite vein in the Carbonate mine, near Oro Grande; in crystallized limestone at the Alvord mine, and in similar rock near Rabbit Spring in San Bernardino county; in each instance the rock was rich in coarse gold. In the Blackhawk mountains 45 miles east of Victorville gold occurs in gray limestone, and at several places in both Mariposa and Tuolumne counties, California, gold is found intimately associated with calcite, forming high-grade ore. Although there is an abundance of lime-soda feldspar (andesine), in the Calico district, no calcite has ever been recognized in the veins of the region.

Special Correspondence

ST. PETERSBURG, RUSSIA

Four Districts and Their Mineral Characteristics. — Manganese and Oil Industries in the Caucasus.—Iron and Coal.—Gold Mining.

Russian mining districts are four in number—the Caucasus, the Donetz Basin, the Urals, and Siberia. Each of these has its characteristic minerals. The first has oils, manganese, and copper in great abundance; the second is limited practically to iron and coal; the third includes iron, gold, and platinum as leading minerals; and Siberia, gold. As to the Caucasus, its mineral prospects, as foreshadowed by operations this year, may be said to be fairly divided. Manganese is for the moment hopelessly strangled by reason of the high freights prevailing. These have made it impossible to export manganese from the Caucasus, which up till a few years ago held the premier position in the world. Unless prompt measures be taken for its resuscitation, it is possible that the most gloomy forebodings of those directly interested in the industry may come true and the manganese business of the Caucasus be little more than a historic record. Respecting oil, which has been the principal industry of the Caucasus, the production since the beginning of the year, particularly in the later months, shows that notwithstanding every effort to improve the position, the oil won in the Baku area of the Caucasus is diminishing in quantity. When the new lands are put up at auction, probably the quantity will be increased; but the old wells will be in process of exhaustion. It would not therefore be safe to say, even if all the available Baku petroleum lands be brought into production, that anything like the old level of over 600,000,000 poods a year is going to be reached again. Farther west at Grozny, on the other hand, the production of petroleum has been growing for many months, and what used to be 30,000,000 poods per annum is going to be well over 60,000,000 poods this year. Grozny already turns out more than 10% of the total Russian production of petroleum. Farther north, in the Kuban province, is the famous Maikop area which, though long known as petroliferous, has recently developed gushers at a number of places, some of them of extraordinary abundance. These occurrences are recent and are the result of experimental boring and have attracted a large amount of English capital. The English houses are boring industriously, but hitherto it was houses like Spies, and pioneers like Prince Saltykoff and Mr. Selitrennikoff that carried off the prizes as far as successful boring goes. It is a promising field, though limited in extent. Wild enthusiasts have staked tremendous areas as petroliferous. There is little doubt that only a small portion thereof will yield payable oil. There is nowhere else in Russia, unless in Turkestan, where oil is yielded in anything like equal quantities, and the Turkestan field is a doubtful one. It has not maintained the promise it gave when oil was first reached; but, on the other hand, it has a fine inland market. There is practically nothing to compete with it. It is away, as far as is known at present, from any other oil sources capable of competing. The island of Tcheleken on the eastern side of the Caspian Sea, very rich in oil, asphalt, and kindred minerals, remains a mystery. The curtain is only lifted from time to time to announce some wonderful progress made there in point of development and exploitation, but it is promptly lowered again and all becomes mystery.

In the Donetz Basin, in respect to iron, it is difficult to get statistics of the production of the mines, and if such were obtained this year, they would not afford reliable data, either comparatively with past years, or as indicating prospects in the future. The iron industry of the South suffered from large reserves carried forward from the preceding year, and this was complicated later on by the cholera epidemic which caused great numbers of workmen to abandon the mines and return to their homes. The consequence must be that the year's total results will be disappointing. The same observation applies to coal. As a matter of fact, the coal production is known for a certain number of months and shows a decrease. This may be attributed, in the first place, to the reason given above, and in the second to the fact that since the price of petroleum came down, large numbers of consumers have abandoned the solid for the liquid fuel, which they had given up when it became dear after the 1905 disturbances.

The iron mining and heavy metallurgical industries of the Urals have been under a cloud for a long time, many of the works having been shut down for want of business, largely due, it is said, to competition from the South, the Donetz Basin, which by reason of its superior organization by foreigners, is able to produce iron and iron goods so cheaply that the railway carriage over the immense distance between that basin and the Urals does not present an effective obstacle to its competition in the Urals district. As to copper, there are three districts where this is produced in great abundance. In the Caucasus the increase in production is so great, amounting to 30 to 40% as compared with last year, that at this rate of progress the Caucasus must at an early date become an exporter of copper. There are no figures available to show how much ore is raised from the mines. This last observation applies equally to the copper fields of the Urals and Siberia, but in both these great copper areas progress is astounding. In these northern latitudes this progress is largely due to English initiative and enterprise, but there are Russian houses, too, with some historic houses, such as the Demidoffs and Bogosloff companies, which alongside their English rivals, so to speak, are largely contributing to make northern Russia and Siberia reliable copper-producing countries. The first eight months copper production over the Empire was 930,153 poods, against 607,640 poods last year's corresponding period. This is an increase of 36.2% over all the areas. The Caucasus increase, to which special reference is made above, amounted to 38.6%. Little need be said of platinum. It is purely a Urals industry. To dilate on it would simply be to repeat what has been said a hundred times before. The only novelty in connection with it is that the price of platinum has reached a record high level, and consequently the producers are working at high pressure. Probably when the figures are published for the year, some time about April or May next, it will be found that 1910 was a record year in the production of platinum. Manganese mining is an industry of the Urals also, but relatively the production is small and, the ore being too cheap to stand heavy railway carriage, it is only of local significance. There is also a considerable production near Nikolaieff, near the Black Sea. Some of this is exported, but it is largely used in the local iron works. There is one industry which will probably soon become important in Russia—that is phosphate mining. Agricultural centres are waking up to the value of mineral fertilizers, and the Government chemists, and more particularly the Royal Imperial Technical Society, are taking a lively interest in the production of superphosphates. Both phosphates and pyrite are found in considerable quantities in Russia, and consequently the material for producing useful mineral fertilizers is at hand. Still, large quantities of sulphuric acid have to be imported, because the deposits of pyrite and phosphates are not always convenient to each other.

The fever which was characteristic of the gold industry for some years has now completely cooled down. There is no longer any excitement on the goldfields, either in the matter of staking claims or in the promotion of new companies. It may be taken that all the unhealthy concerns floated are looked upon as dead, and only the substantial, good companies are working. These are doing good business. The leading gold companies of Russia are the Lena Goldfields and the Bogosloff. Then there are the Kishtim and others, all of which are doing well. The Lena, particularly, after many years of trial during which it was necessary to borrow extensively, is now producing record quantities of gold, has paid off debts and is clear of encumbrances. This, it is claimed by Englishmen, is largely due

to their intervention. On the other hand, Russian shareholders maintain that the greatest interest in shares held in the Lena fields lies in Russian hands, and they show a strong disposition to fight for their rights, declining to allow the English to do what they like with this Siberian property. Little need be said of Northeast Siberia, news from which appears chiefly to indicate that there is a tri-national struggle for mastery there. It lies chiefly between Americans and Russians, the Japanese intervening. The situation is by no means clear. The district is immensely wealthy in gold; but is entirely unorganized and unpromising, until the Russian Government puts the economic situation on a recognizable basis. In the Urals placers are being rapidly washed out and vein gold will have to be relied upon. Of this there are many signs. Geological surveys and other investigations have revealed that when technical exploitation takes place the veins will yield handsome returns to investors. In Siberia generally, the gold is alluvial. That does not mean to say that there is no vein gold, but the immediate future of the gold industry lies in gravel washing. Just now this is done mostly by hand, but if the country is ever to get much beyond its present state of gold industry development, dredging alone can do it. In the Amur province, on the other hand, along with alluvial, vein gold is more prominent than in other parts of the Empire, but here again, we have international complication. Russia may propose, but the Chinese, by reason of their proximity and the ease with which they can flood the country with workmen, will probably dispose. Here also the situation needs clearing up.

Salt is obtained in large quantities in various parts of Russia, such as the Caucasus in south Russia proper, and near the Caspian, as well as other parts, but it can only be called of local interest, as it cannot be said to affect the world's market. Other mining interests worthy of note in Russia, but of no great outside account, are asbestos, which is mined extensively in the Urals and Altai, and zinc, which is purely a Polish industry. A certain number of precious stones are won in the Urals and Siberia, but they are of the second or third-class order. As to technical matters in mining operations, nothing notable has arisen further than the fact that on the surface aerial tramways have become common, both in the coalfields and in the goldfields; and electricity is very largely employed underground in the Urals and Siberian mines, chiefly on properties run by foreigners. Poland need not enter into this review. It is a large producer of coal and iron with little significance for the outside world except in so far as it affects Austria and Germany.

FAIRBANKS, ALASKA

A Prosperous Season in 1910.—Innovation in Tunnel Driving.— Promising Quartz Prospects.

A prosperous season in this district has just closed. The production of gold for the year has not fallen much short of that of last year. The Seattle assay office reports a decrease of over $1,000,000 for Alaska, but part of this is accounted for by the fact that a large quantity of bullion has been shipped this year to San Francisco. Besides, in one of the banks at Fairbanks several operators have melted their own bullion, shipping it to other points. In this district the cream of the placer ground is being worked out, and while the lower-grade ground is fairly profitable, much of it has been abandoned for the present in favor of the newer camps. While development of quartz mines has progressed steadily, bullion from this source cannot supply the deficiency caused by decreased placer production. The encouraging progress made on several properties indicates that a substantial production can be expected from the quartz properties next year. While the Rhodes-Hall property was one of the first to show commercial ore, not much development has been done this summer owing to causes not connected with the property. The ore taken out last winter has been milled. From the Crawford lease, on a block 50 by 100 ft., close to $20,000 was produced, the ore averaging $150 per ton in free gold; and the quartz taken from the main tunnel, now in 800 ft., is being milled, returning as much as $150. There are now backs available in the main tunnel worth many thousand dollars, while the ore below is still untouched. Development consisting of driving an adit on the vein, is in progress. Close to this property on Willow creek the Tolovana Mining Co. is developing with hand-labor, and with funds supplied from the proceeds of ore broken. A recent run of 12 tons gave bullion worth over $1100. The Spaulding-Clough property has been prospected on the surface during the past season. This winter the 60-ft. shaft, in which $50 ore was found last spring, will be again opened and development work pursued. The Willow Creek claim, belonging to Herschberger, Buell & Phipps, has been producing ore that is now ready for shipment. This claim was leased by Mr. Buell. On Wolf creek, where some rich ore has been taken out by Horton & Solomon, a 200-ft. cross-cut has been driven this summer to open the vein. A novel method in tunnel driving has been used here. Instead of drilling and shooting, steam points with Burleigh bits have been used. With 24 hours steaming the schist crumbles and can be readily mucked out. This method has proved economical and rapid, and was discovered by noticing that a piece of schist placed on the boiler crumbled after 24 hours' application of heat. Lawrence McCarty has been prospecting at the head of Wolf and Fairbanks creeks and has made several mill-runs of his ore which averaged $70 to $80 per ton; while the owners have machine-drills available, they will not be used till threatened litigation is settled. These are the only machine-drills so far brought in. The litigation between the Butler-Petree and the Rex Mining Co. has been settled in favor of the Rex. About $30,000 has already been spent on the Butler-Petree, a 160-ft. incline shaft and several prospecting levels having opened a vein from 4 to 8 ft. wide, the ore assaying about $30. The Pioneer Quartz Mining Co.'s property on Chatham has been cross-cut on the hill to open the vein. A lease on the lower end of the claim is being worked by P. R. Colvin. A test shipment of ore to the Fairbanks mill ran $60 per ton.

Two leasing companies are at work on the Fredericks lode. On the lower lease a level is being driven on a 7-ft. vein; on the upper lease a 75-ft. shaft has been sunk and some good ore found. This lode was discovered by prospectors walking through a railroad cut. The rock ballast at that point has given assays as high as $100 per ton. Glazier & Crockett have the lower, and Ernst Peterson the upper lease. Samples taken from ore sacked for shipment on the upper lease have assayed $150 to $200 per ton. On the divide between Vault and Wild Cat creeks, Hoel Bros. and Johnson & Witmer have opened two good prospects. One vein varies from 15 to 20 ft. thick and carries high-grade ore. Ore from a smaller vein milled over $40 per ton. A 2500-lb. lot sacked without sorting gave these returns at the Fairbanks mill. Two shafts have been sunk on these properties, one 50 ft. deep and the other 70. As the four partners mushed in over the trail last spring, the locating and development of the two veins represents less than a season's work. Besides the Vault Creek properties, Sam Hoel has located a lode at the head of Dome creek. The left limit of Fairbanks creek has been the scene of the most promising discoveries of the year. M. T. and A. H. Cook have traced and located a series of veins on a group of 10 claims. A 60-ft. adit has been driven into the Excelsior that exposes a 7-ft. vein, carrying from $10 to $20 in gold and from $15 to $30 in silver. The adit is being extended to tap a smaller vein cropping on the surface that assays high in gold. A prospect shaft on the Plumbum opened a 15-ft. vein, containing $5 in gold from wall to wall, with a foot of oxidized lead on the foot-wall, carrying 220 oz. silver. While the Plumbum and Excelsior are nearly parallel and seem to cross Fairbanks creek, smaller veins carrying high-grade gold ore have been found that almost parallel the creek. Beginning with a foot of high-grade ore on one claim that pinched to a few inches at the frost line, the shoot at 40-ft. depth has widened to 5 ft. Thirty inches

of $20 ore has come in on the foot-wall, the rest being a high-grade decomposed quartz, assaying up to $700 per ton. Above this group of claims, on the left limit of Fairbanks creek, August Hess has traced and is opening a vein of high-grade white quartz. Below the claims of Cook Bros., Goyette & Jacobson are sinking on a 2½-ft. vein, the dip of which changed from north to south at a depth of 30 ft. A shipment of ore will soon be made to determine its value. While these cases show how much a few prospectors have accomplished this year, there are other discoveries too numerous to mention that are lying idle for want of money to buy grub and powder. As this situation is clear to everybody, two companies are being formed that should help matters considerably. Sufficient funds have been pledged by one to bring in 2 core-drills the first of next season. The object of the company is to prospect the existing orebodies and take an interest in the claims as part or all payment for work. Labor cost being a big item here, these drills should be useful and successful along this line. E. H. Mack is promoting the company and reports the support of local capital. A leasing and contracting company, that purposes to bring in equipment for power-drills and other necessities of economical mining, will probably operate here next year.

BLACK HILLS, SOUTH DAKOTA

Black Hills Conditions in 1910. — Labor Situation. — Important Developments of the Year. — Homestake Water Power System. — Dredge at Mystic.

January 1, 1910, was far from a happy holiday in the Black Hills, South Dakota. With every mine, from the great Homestake down, suspended on account of labor difficulties, the outlook was anything but bright. Commencing late in the previous summer, with the Homestake as the main point of attack, the action of the Western Federation of Miners made it necessary for all of the operators of the region to suspend. Suspension of operation on November 24, 1909, by the Homestake was followed by a suspension of all Black Hills properties. The Homestake, early in January, began recruiting a new crew, numbering old employees who swore allegiance to their employers as against the Federation, and miners brought from the neighboring States of Missouri, Kansas, Colorado, Michigan, Wisconsin, etc., and operations were gradually resumed until by the middle of March the mine had again reached its full capacity. Since that time it has operated uninterruptedly. The neighboring properties then made moves looking toward resumption, with the result that by June all were again operating to capacity. The 'card system' is now almost universally used in the mines of the Hills, and an employee must state over his signature that he is a member of no union. On January 21, the 200-ton cyanide mill of the Wasp No. 2 Mining Co., at Flatiron, was destroyed by fire, but was later rebuilt on an enlarged scale, the new plant having been put in operation on December 1, last.

Two important ore discoveries were made in the Black Hills during the year, one of which was made in the Golden Reward, where, during the summer, an orebody was opened that several months' development has shown to have a length of over a quarter of a mile, a thickness of about 14 ft., and a width of close to 300 ft. The Golden Reward's 250-ton cyanide plant at Deadwood is to be increased to 500 tons capacity; and a roaster is to be built to give the ore from the new shoot a preliminary treatment that will make it amenable to the cyanide process. This is one of the biggest discoveries ever made in the Bald Mountain district and assures the Golden Reward a mill supply for many years. The second discovery was made at Carbonate, where the Black Hills Development & Financial Corporation, locally known as the 'Bunce deal,' opened the old workings of the Iron Hill, Seabury-Calkins, Home Run, and other well known producers. One of the important showings in the property is a blanket deposit of jasper ore, containing about $6 per ton in gold. This orebody is considered amenable to cyanidation. Other ore contains galena and hornsilver. In November it was announced that a smelter would be built early in the year 1911. Except during the time of suspension on account of labor difficulties, the other Bald Mountain properties operated to good advantage. The Mogul company, the largest producer, kept its Bald Mountain mines and Pluma mill active, working as high as 340 tons per day. The Lundberg, Dorr & Wilson cyanide plant at Terry, operated on its own ores and those from the Portland and P. H. Bertschy's lease on Imperial territory. Late in the summer the Portland Mining Co., which by purchase recently largely increased its mining area, proposes erecting an aerial tramway to connect mines and mill. The Reliance M. Co. has been reorganized and financed to carry on the operation of its property at Bald Mountain. One of its problems is the disposition of its tailing. The mill is situated on Annie creek, above the Homestake hydro-electric plant, and the spring rains have twice washed out retaining dams and allowed the tailing to run into the Spearfish. The latter has been enjoined against polluting Spearfish creek, and may build a substantial dam and discharge the tailing dry, instead of sluicing it. A body of

New Wasp No. 2 Mill, Flatiron, S. D.

pyritic ore, in the workings of the Gilt Edge-Maid company, gave assurance of an abundant supply of pyrite, and work has been begun on a pyritic smelter at Galena, two miles down the gulch from the mine. A concentrating plant and experimental smelter are to be erected. The Homestake's Spearfish hydro-electric installation has been completed and contracts have been let for the equipment of the power-house. Tunnels totaling 23,862 linear feet, 7 by 9 ft., cross section, carry the water approximately three-fourths of the distance from the intake to the penstock. The power-house will contain three 3000-hp. overhung Pelton water-wheels, three 2000-kva. A. C. generators, ten 667-kva. oil-insulated, water-cooled transformers, two 100-kw. 3-bearing motor generator sets and one complete switchboard. The Westinghouse Electric & Mfg. Co. has this contract. The completion of the tunnel work and the letting of contracts for equipment mark the beginning of the end of a stupendous task, actual work on which was begun two years ago, and the completion of which is anticipated about the middle of 1911. During 1910 the Homestake company promoted the organization among its employees of the Homestake Employees' Aid Fund. Under its plan of operation each employee contributes $1 per month, and the company binds itself to donate not less than $1000 each month. A graduated scale of benefits has been adopted. The Alder Creek company, being financed by F. B. Hitchings, of Chicago, states that a big cyanide mill will be erected early this year to treat ore from its ground, adjoining the Wasp No. 2.

A Colorado company has about finished building the first gold dredge in this district at Mystic, on Castle creek, where the ground was thoroughly tested. The dredge will be driven by electricity, and its operation will be watched with much interest, and its success may lead to other installations of this kind on Castle and Rapid creeks. Tin milling was conducted during the summer and fall by the Tinton company, and results were so encouraging that it is announced the plant is to be enlarged next summer.

GLOBE, ARIZONA

Interesting Data Concerning the Newer Mines of the District.—Activity and Progress.—Miami Mill.

The Inspiration Copper Co. continues its exploration work, both with churn-drills and in underground workings. This company is probably getting better results than any other company operating in the Miami district, since practically all the work with the churn-drills and that underground are continually opening new orebodies and adding to the valuation of the property. At present two of the company's churn-drills are being used for exploration, while the other four are used in blocking out the orebodies already discovered. Sinking in the Joe Bush and Colorado shafts continues, and ore of commercial grade is being found in the latter. In all the holes recently drilled the average grade of ore found has been much higher than when drilling was first started; in some of the holes samples assayed 3%. The concentrator of the Miami Copper Co. is rapidly being finished and there seems no question that everything will be in readiness to begin operations about February 1. The road to the portal of the tunnel through which the concentrate will be hauled is ready and the tramway from the railroad in Miami should be finished in the next two weeks. Steam was turned on in the new boilers on New Year's eve, and all the new machinery tried worked satisfactorily. With the exception

Globe, Arizona.

of a few minor details the concentrator is in condition to start treating ore. In the exploration department the churn-drills being used in the northwestern part of the property continue with 12-hour shifts, three of which are averaging 35 ft. each per day. The Apache Copper Co. has started work on its property situated six miles northeast of the Old Dominion mine, at the foot of the Apache mountains. Considerable work was done on these claims a few years ago and some shipments of ore were made that sampled as high as 10% copper. A resumption of work on these claims may result in a new producer for the Globe district. The Pfister brothers, of Pittsburg and Globe, are in charge of this work. The Warrior Development Co. started shipping its ore to the smelter at El Paso the first of the year, instead of to the Old Dominion at Globe as heretofore. Its daily shipment amounts to about 100 tons, but the intention is to increase this by 25% in the near future. The ore being shipped consists of the usual high-grade chrysocolla that samples 10% copper. The orebody in block 40, that was opened some time ago, and in which development work has been carried on lately, shows a considerable tonnage of commercial ore of the same character. M. E. McCarthy is in charge of the work at the property and has about 75 men employed. The California adit, on the property of the Copper Reef Consolidated Mining Co., is now in 530 ft., and it is expected that within the next 25 ft. the California lode will be cut. In the inclined shaft on the North Star claims a depth of 435 ft. has been reached; the last 25 ft. of sinking was in the hanging wall. At 400 ft. the vein that this shaft has been paralleling was opened and ore found that assayed 12% copper, and about 30% iron. The intention is to continue sinking until the 500-ft. level has been reached, and after a station has been cut a cross-cut will be driven to the lode that was opened at 400 ft. The stockholders of this company will hold their annual meeting in Globe the first Monday in February. The Summit Copper Co., purchaser of the Gibson property eight miles west of Miami, is in position to ship ore averaging 30% copper. In the course of developing and blocking out the low-grade ore, much high-grade chalcopyrite has been found that it will pay to haul by wagon to the railroad at Miami, and in the next six weeks shipping will be started. At the present rate of extraction an average daily shipment of about ten tons can be made. Bins have been constructed near the new vertical shaft, close to the wagon-road. The Gibson mine, as this property was formerly known, holds a high place among the mines of the district; for the past six years it has produced more high-grade copper ore than any other mine in the vicinity of Globe, and from the developments since the ground was taken over by the Summit people it would seem that it will be able to maintain this reputation. A station is being cut at 200-ft. depth, and when this is completed a level will be driven east and a raise made to connect with the old workings to provide ventilation. It is probable that a body of ore will be developed in the driving of this level, as it will be along the Pasquale vein in which ore assaying 4% copper was found on the 300-ft. level. In cross-cutting west on this level a vein of ore was opened in which some of the richest ore was found. In the north drift on the 300-ft. level a winze was started on the high-grade chalcopyrite ore that was found a short time ago, but at 10 ft. the flow of water was so great that sinking was discontinued; the ore will be reached later from below, when the cross-cut on the 400-ft. level is completed. This vein when discovered measured about 9 in. wide, but with a little development it widened to 2 ft., samples of the ore assaying 35% copper. With the exception of the old Pasquale adit, which was the first work done near the new shaft, and a few stopes from this adit, from which some ore was taken, little work was done by the former owners, and indications are that the Pasquale is richer than the Summit vein that was worked by the original owners. In the old workings, on the Summit vein, repairs are being made in the drifts and everything being put in readiness for ore extraction. In one part of the old workings there is a body of ore extending from the 400 to the 300-ft. level, and about 30 sets wide, which assays about 5% copper. Raises made on both sides of this orebody make it possible to estimate its extent. When this mine was formerly shipping, ore that assayed less than 25% was not considered of value, and it is estimated that there is over 100,000 tons of ore on the dump that will sample from 5 to 8% copper. In December two tons of this ore was sent to an Eastern firm which is to make tests to determine the best method to treat the ore, as well as the kind of machinery required. At present about 60 men are employed underground and on the surface workings, Charles Myers being superintendent.

TORONTO, CANADA

The Railroad to Porcupine. — Many Claims Purchased in That Camp. —Progress of Development.—Cobalt Dividends.—Coniagas.

Excellent progress is being made with the construction of the branch line of the Temiskaming & Northern Ontario railway to the Porcupine gold camp. The number of men at work is about 250, and this force will be doubled in January, or as soon as laborers can be procured. The clearing of the right of way is almost completed. Freight and passenger rates by the winter sleigh road have been considerably reduced, the prevailing freight-rate from the railroad being 70c. per 100 lb. A number of properties are changing hands in anticipation of a boom. One feature, ominous of coming wild-cat flotations, is the readiness of promoters to pick up locations anywhere within the area, regardless of whether any actual discoveries have been made. Among recent transactions is the purchase of a number of claims by the Newman-Mancha-Johnston syndicate, composed of Louisville, Kentucky, and Haileybury,

Ontario, investors, the locations obtained including the eight Healey properties in Del Oro, the Ritchie group of four claims, and the two Mancha locations in the same township. Development work on some of these has begun, resulting in finding good ore. Young Bros., of North Bay, Ontario, have bought for about $10,000 the Tisdale claim of W. S. Edwards, who was connected with the Dome. A New York syndicate has an option on ten claims owned by Fred Harris, John Novack, Silas Howson, and Willard Pooler. The Hollinger, some of the stock of which was recently put on the market, and which is about the only non-dividend issue that is holding firm during the holiday depression, has 70 men at work and several finds have been made. The main shaft is down 175 ft. and it is stated that the ore taken out at this depth is equal to that on the surface. Percy A. Robbins, who has been for some years in charge of the McKinley-Darragh of Cobalt, has been appointed manager of the Hollinger at a salary of $20,000 a year. He will also have charge of the milling company and look after the other Timmins interests. The Dome company has placed a contract for a 40-stamp mill.

The total dividends paid by Cobalt mining companies for 1910 amount to $7,902,000, or including the estimated profits of the O'Brien, a close corporation, to $8,302,000. A calculation of dividends yielded since the establishment of the camp, including estimated returns of close corporations and mines when under private management, gives an aggregate of $25,342,355. The Nipissing heads the list with returns of $6,340,000, followed by Kerr Lake, $2,730,000; Crown Reserve, $2,653,221; and La Rose, $2,079,185. The total number of mines which paid dividends during 1910 is 11. At the annual meeting of the Coniagas a report was presented showing a surplus of $952,402. The revenue for the fiscal year was $1,010,433, the expenses being $256,524, leaving a net profit of $753,888. The Coniagas Reduction Co. treated during the year 1788 tons of ore and shipped 2,726,609 troy ounces of refined silver. The cost of production was 13.28c. per ounce. In the east drift on the 300-ft. level of the Beaver an 8-in. vein carrying smaltite and high silver content has been tapped. This is not a new vein, but tests at the upper levels show nothing equal in richness to the ore at depth. High-grade ore has been opened at the 300-ft. level on No. 3 vein of Hargrave, about 80 ft. from the Kerr Lake boundary. Driving on the same vein 60 ft. above this is in progress in high-grade ore. The shareholders of the Trethewey have ratified the proposal to increase the capital from $1,000,000 to $2,000,000 for the purchase of other properties. A number of the Gowganda mines shut down for the Christmas holidays. The Bartlett has sunk a shaft 100 ft., and obtained good ore in a crosscut at the 40-ft. level. The power-house and machine-shop were recently burned, but the machinery was not injured, and the damage will be repaired. The shaft of the Boyd-Gordon is down to 200 ft., and will be sunk lower. Crosscutting is being undertaken to open the vein at present depth. The Reeves-Dobie people have begun concentrating low-grade ore, the stamp-mill having a capacity of 20 tons per 24-hr. day. The Miller Lake-O'Brien and the Millerett companies are taking out high-grade ore for winter shipment. The Canadian Government, in order to encourage the copper industry, has passed an order in Council, providing that no royalty shall be charged on the products of copper mining locations for 10 years from January 1911. H. M. Ami, for 20 years connected with the Canadian Geological Survey, has applied for superannuation on account of continued ill-health.

CENTRAL AMERICA

Sale of the Bonanza Mine.—A Recent Flotation in England.—Scarcity of Labor.

The Bonanza mine has been sold, subject to the owners' securing title from the Government to a claim protecting the dip of the lode. The claim desired is one of the Dietrick concession, and it is understood that an arrangement has been made whereby the owners of the concession will interpose no objection to the acquisition of this claim as part of the Bonanza group. The Santa Rita mine and mill are operating, and producing $1000 to $1500 per month, part of which is being applied in liquidating indebtedness. The Jicaro Gold Estate, formerly operated by an English company which opened the San Christobel mine, was floated in London recently at £75,000. Conditions generally in Nicaragua are becoming settled, and the mines on the western side are operating again, though labor is scarce. In fact, the greatest difficulty in operating in any part of the country is the matter of obtaining sufficient labor. The Oroyo Exploration Co. has exercised its option on the Babilonia mine in La Libertad district, and is putting in a plant on the Leonesa. The Javali and San Juan are operating, the former having 10 and the latter 5 stamps dropping.

SPOKANE, WASHINGTON

Brief Resume of Operations in the Coeur d'Alene.—Noteworthy Revival at Republic.

The Coeur d'Alene district, in the northern part of Idaho, which is credited with one-third of the annual lead output of the United States, has had a year of marked activity in development and production. The record of the year was characterized by the adjustment out of court of the litigation that had been pending between the Bunker Hill & Sullivan M. & C. Co. and the Federal Mining & Smelting Co. for the possession of certain mineral holdings in the Wardner part of the district; by the completion of the

Bunker Hill & Sullivan New Mill.

Idaho Northern railroad from Enaville into the Murray and Pritchard Creek region; and by the addition of several mines to the list of ore-producers. The Bunker Hill & Sullivan company, standing at the head of lead-silver operators, put the first unit of its new concentrating mill in operation last summer, and since then has been concentrating an average of 1350 tons of ore per day in its two plants; the second unit of the new mill is expected to be ready for work in the next three months. This mine is entered through the Kellogg haulage adit, which starts near the millsite and extends 10,000 ft. to the ore-zone, cutting the vein at about 2400 ft. depth on its dip of 45°. While the greatest ore output still comes from the workings above this haulage level, recent development has been continued to a depth of 600 ft. below it; and at the collar of the interior shaft that starts on this level an electric hoist is to be installed. The Federal company is mining at Wardner, Mace, and Mullan; and is operating three concentrators. There are large ore reserves exposed in the mine of each of these groups, though the settlement made with the Bunker Hill company results in diminishing the importance of the Wardner group. It is understood that the company contemplates doing extensive development in new ground, and that it is in the market to purchase other properties. On August 31, 1910, it had a cash surplus of $1,015,109. The Caledonia and Stewart mines, both in the Wardner country, have been operated successfully the past year, the latter concentrating its ore in a leased mill; the former is practically a new mine. The Success mine, near Wallace, is perhaps the most successful zinc mine in the district. A mill is operated by which zinc and lead concentrates are made. The Gold Hunter, a lead-silver mine at Mullan, has

been opened to great depth by adits and winzes, and over 200 tons of ore per day is being concentrated. The Snowstorm, yielding copper ore, has been developed by a number of adit-levels, the ore shipments amounting to 100 tons per day. The mine force has been lately doubled. The Hercules, one of the richest lead-silver producers in the Coeur d'Alene, is situated near Burke. It produces a big tonnage of first-grade ore, and a larger output of concentrating ore, the latter being milled at Burke. The ore is graded at the company's sorting plant, situated at the mouth of its No. 4 adit. The mine is opened by four adit-levels, the lowest of which taps the orebody at a depth of 1700 ft. The Hecla M. Co., which developed its mine at Burke by means of a 1200-ft. shaft, with levels leading from it to the orebodies, has modern electrical equipment for hoisting and has good facilities for sorting and concentrating. The progress made this year in Murray district has been characterized by extensive development, considerable production, and mill construction. The building of the railroad from Armsted, Montana, to Salmon, Idaho, has greatly stimulated the mining industry in Lemhi county, Idaho, which comprises silver-lead and gold mining.

The most pronounced revival of a hitherto lifeless mining district has taken place at Republic, where the Republic Mines Corporation has mined and sold ore sufficient to pay $225,000 for the mine, which it held under option, and to pay dividends to its stockholders in the amount of $100,000, all during 1910. The ore from which this revenue was derived was taken from stopes not more than 150 ft. below the surface. As the result of this success other mining and leasing companies have become very active in that district. Not less than ten properties are being developed in the vicinity of Orient, on the Kettle river; and two or three of these, notably the First Thought, are satisfactory ore producers.

NEW YORK

Carnegie Trust Co.— Morgan Interests in United States Steel. — The Copper Situation.—Influence of Copper Porphyries.— Calumet & Hecla.—Arizona Copper Company.

The culmination of the troubles of the Carnegie Trust Co., with which, however, Andrew Carnegie was in no way associated, has been a feature in New York financial circles. Charles C. Dickinson, its late president, had become interested in an alleged process for transmuting base metals, and was stated to have been injured by the inhalation of fume while seeking to witness the transmutation taking place in the crucible. The Trust company has long been known in the Street as a weak spot, and relief was felt when it was known that the State Banking Department officials had taken charge. Two or three other smaller institutions, built up by Morse-Heinze methods, were taken in hand at the same time by the larger banks headed by J. P. Morgan & Co., and Mr. Morgan is again being recognized as the official towing and salvage cruiser in Eastern financial waters. It is also recognized that the salvage so exacted is heavy. J. P. Morgan & Co. is considered the head of a financial organization that dominates the banking situation in the East. In addition to the annexation of another group of banks the Morgan interests are credited with advancing their influence in United States Steel. The recent resignation of William E. Corey as president is looked upon as the end of the Carnegie influence, and the surrender of the field to the Morgan crowd, headed by E. H. Gary.

The forecasters have been busy figuring out some arrangement for the early formation of a copper merger, to be headed by Mr. Corey, or by George W. Perkins, till recently a partner in the house of Morgan & Co. The copper merger is believed to be dependent upon the outcome of the cases now before the United States Supreme Court, in which the interests of the Tobacco Trust and Standard Oil Co. are involved. The copper situation is becoming critical. The curtailment policy, much talked of as stabilizing the market, appears to have failed of its purpose. The producers apparently are favorable to restriction of output provided 'the other fellow' does the restricting. December production was 123,339,219 lb.; that of November was 119,353,463; October, 126,469,284; September, 119,519,983 lb., showing plainly that the output, if decreased at any time during the past half-year, has not yet made itself felt in the refinery product. Some consolation is being extracted from the fact that copper stocks showed a net decrease for the month of 8,358,874 lb., but this is due chiefly to the export of 88,104,075 lb., which is considerably larger than for any single month since the association began its monthly compilations. Domestic deliveries shrank from 60,801,992 lb. in November, 67,814,172 in October, and 64,501,018 in September, to 43,594,081 lb. in December, showing that consumers have returned to their former position of allowing the sellers of copper metal to carry the load of metal, adopting again a policy of buying only for immediate needs. It is not alone present production that makes the situation critical, but the output of the copper-bearing porphyries must be reckoned with. Miami, Ray Consolidated, Chino, Inspiration, and Mason Valley are nearing the time of initial production. For the year production increased 46,717,996 lb. over 1909, and the deep-level mines and the steam-shovel properties will alike be obliged to co-operate without regard to which party may or may not be responsible. The consumers are looked to for the betterment of the situation as compared with a year ago and for a net decrease of surplus stocks of 19,735,916 for the year. The Calumet & Hecla merger may not have plain sailing. The holders of Isle Royale are understood to be strenuously objecting to the proposed deal. Isle Royale was controlled by the Bigelow interests, which, when the control was in contest two years ago, tried to enjoin the Calumet & Hecla in the Michigan courts, claiming a conspiracy was afoot to force a consolidation. This suit is in a way still open, the court having said that if at any time the Calumet & Hecla attempted to force a merger the court could then act. In the interest of future peaceful conditions the various companies in the Globe camp, operating in the porphyry district, including the Miami, Live Oak, Keystone, Inspiration, and others, have executed a side-line agreement, which will eliminate possible disputes in the course of operation. J. Parke Channing, who is credited with having fixed the ratio of exchange upon which the various companies are to go into the Calumet & Hecla merger, having completed that work, is again giving his attention to the development of the Miami. Mr. Channing has been in Arizona for some days awaiting the commencement of operations at the new plant. The Miami mill has some original ideas Mr. Channing put into effect, and the Miami crowd and the Guggenheim people are watching for results with interest. The Ray Consolidated and Chino mills are both being modeled after the Utah Copper and Nevada Consolidated plants, and there is some rivalry as to final results between the Miami and the other two companies. Miami has been quiet in the New York market for some time.

Recent cable dispatches announce the death of John Gill, of Edinburgh, Scotland, for many years chairman of the Board of Directors of the Arizona Copper Co. Early last year Mr. Gill was in this country and was engaged in several long conferences with the Cole-Ryan interests, who were at that time endeavoring to secure a controlling interest in that company. It is stated that an offer of 50s. per share was made for the control, Mr. Gill's price being 70s. Together with other coppers, the market in Arizona has eased off and the stock is now selling around 30s. per share. It is claimed in Boston that the United States Smelting, Refining & Mining Co. is planning to re-open the Richmond-Eureka property in Nevada, having recently purchased the old Eureka & Palisade railroad.

There has been a stimulation of interest in the Nevadas by reason of the Tonopah Mining Co.'s excellent record for the last month of the year, which amounted to $194,000; the highest previous months were April and May of last year, which ran $184,000 each. The showing of Tonopah Mining and the development of the Tonopah Belmont into a mine has aroused new interest in precious metal mining.

General Mining News

ALASKA

The report of the Alaska Treadwell Gold M. Co. for the month ended December 15, 1910, was as follows: Mill time, 30 days. The 240-stamp mill ran 24 days, 25 min.; water power, 3 days, 2 hr., 26 min.; steam-power, 20 days, 21 hr., 59 min. Ore crushed, 27,619 tons; concentrate saved, 569.94 tons. The 300-stamp mill, water-power, ran 8 days, 2 hr., 56 min. Ore crushed, 13,990 tons; concentrate saved, 304.37 tons. Estimated gross value of free gold, $62,729.01; estimated gross value of base bullion, $893.26; estimated gross value of concentrate, $44,671.06. Total, $108,383.33, less $527.58 for 195 tons from 700 Ft. Claim, $107,855.75; total realizable value, $106,777.20. Operating expense, $93,277.31; net operating profit, $13,499.89. Construction expense, $17,735.33. Yield per ton of ore milled, $2.59. Stock of ore broken, 68,691 tons. Development work, 847 ft., 195 ft. in ore, 652 ft. in waste; assay-value of ore, $1 to $3.51 per ton.

The report of the Alaska Mexican Gold M. Co. for the month ended December 15, 1910, was as follows: Mill time, 30 days. Full mill of 120 stamps ran 29 days, 7 hr., 52 min.; water-power, 6 days, 2 hr., 16 min.; steam-power, 23 days, 5 hr., 36 min. Ore crushed, 17,347 tons; concentrate saved, 374 tons. Estimated gross value of free gold, $30,537.13; estimated gross value of concentrate, $32,727.40. Total, $63,264.53, less $1209.42 for 671 tons from 700 Ft. Claim, $62,055.11. Total realizable value, $61,434.56. Operating expense, $35,959.86; net operating profit, $25,474.70; construction expense, $2770.06. Yield per ton of ore milled, $3.57; stock of ore broken, 1672 tons. Development, 459 ft., 271 ft. in ore, 188 ft. in waste; assay-value of ore, $2.28 to $4.62.

ARIZONA

MOHAVE COUNTY

The Needles Mining & Smelting Co., a subsidiary of the United States S. R. & M. Co., owns and is operating the Tennessee, Banner, and Champion mines in Chloride district, the ore mined from them being shipped to the company's concentrator and smelter at Needles, Cal. Sinking is in progress in the Tennessee shaft, now at a depth of about 500 ft., the intention being to sink to 1200 ft., and the property is to be explored and developed at that depth. The product of the mine is lead, silver, iron, and zinc ore. The Union Basin M. Co., operator of the Golconda mine in Cerbat range, during 1910 shipped 242 cars, or 8712 tons, of ore averaging 47% zinc, accompanied by some gold, silver, and lead. Besides paying for development and improvements, the company has paid dividends amounting to $70,000. John Boyle, Jr., one of the principal stockholders, is the general manager. The Tom Reed Gold Mines Co., in the month of December 1910, extracted gold and silver bullion of the value of $75,500. The mine, stamp-mill, and cyanide plant are in Goldroad district.

YUMA COUNTY

It is announced that the smelter at Swansea, belonging to the Clara Consolidated Gold & Copper Co., is to be put in operation this month. The Copper Lead Development Co. is sinking a shaft, and doing other development work on its property near Swansea. It is said there is 1000 tons of gold and copper ore ready to be hauled to the smelter.

CALIFORNIA

AMADOR COUNTY

(Special Correspondence.)—The shaft at the Lincoln has been retimbered to the 450-ft. point, and the drifts on the 500-ft. level are being drained. As soon as this has been accomplished, a reservoir will be constructed to hold the surface-waters, and all the drainage from the Wildman & Mahoney mines, which connect with the Lincoln at the 500-ft. point. With the completion of this reservoir, a cross-cut will be driven to the west in hopes of intersecting the rich west vein of the South Eureka. The shaft will be unwatered to the bottom and cross-cuts extended from the 650, 800, 1200, and 1950-ft. levels. The Argonaut company has placed an order for a 500-hp. electric hoist. This will replace the engine at present in use. The management is planning for more extensive operations this year. Excellent ore reserves have been opened in the lower workings. The Bunker Hill continues to disburse regular dividends of 5c. per share monthly. On the 1950-ft. level the vein has been opened about 500 ft. and has a width of close to 20 ft., the bulk of the ore being of milling grade. It is expected to have the 20 additional stamps in operation about February 15. It is reported here that the Amador Queen No. 1 mine will be re-opened at an early date. The 1200-ft. shaft will be unwatered and east and west drifts extended. The property was recently bonded to C. D. Porter of San Francisco. The South Eureka shaft has been placed in good condition and operations are to be resumed. During the period of inactivity the company has paid regular monthly dividends of 3c. per share out of the treasury. The Kennedy continues its normal output. Good ore is being mined in the vicinity of the 3500-ft. level, and recent developments have proved satisfactory. The 100-stamp mill is operating steadily.

Jackson, January 12.

IMPERIAL COUNTY

The mine and 40-stamp mill at Hedges are in operation with a force of 200 men. This property is in the eastern part of the county, 5 miles north of Ogilby station, on the Southern Pacific. The Southern Pacific Co. is to be paid $773,000 by the United States Government for the work it did three years ago in stopping the overflow of Imperial valley by the Colorado river. The company asked for $1,600,000.

KERN COUNTY

Ore is being mined on two veins of the Butte Lode mine at Randsburg. That being taken out and milled by E. Baldwell yields $50 per ton. James Rice, another lessee, has 75 tons ready for the mill which is reported as assaying $100 per ton.

SIERRA COUNTY

It is claimed that H. L. Johnson, of the Tightner mine, at Alleghany, recently shipped gold bullion of the value of $75,000, and that the gold for this shipment was recovered from 1200 lb. of quartz.

TUOLUMNE COUNTY

(Special Correspondence.)—The Spring Gulch mine is to be unwatered preparatory to the operation of the property, which, with the Somerset, is held under bond by W. B. McCubbin and George Ash. The latter claim is being developed, and the find made several weeks ago insures good returns when the milling of ore is commenced. The Mohican mill will be in operation again in about six weeks. A small force of miners has been steadily employed in development, and a supply of ore will soon be available, some of which is of high grade. It is reported that a body of ore 65 ft. long and 18 in. wide, assaying $600 per ton, has been uncovered in the Glanelli mine, near Arastraville. The Gold Ship Mining Co. expects the arrival soon of three Westinghouse transformers and a Byron Jackson pump for its gravel property near Groveland. The electric transmission line has been completed. The property is to be equipped for the economical extraction, crushing, and washing of gravel by next spring. Some development work is being done at the old Tarantula mine, near the Rawhide. The 20-stamp mill at the Tarantula, is reported as about completed and will be started in a few days. Eighty men are employed at the App. A pump capable of discharging 20 in. of water per minute, and which will be operated by electric power, has been installed at the 300-ft. level in the Jumper. A contract has just been let to make a 200-ft. raise, and much other new underground work is contemplated. With the completion of the surface improvements the Jumper will be among the best-equipped mines on the Mother Lode. The site upon which for more than a half century has stood St. Ann's Catholic church, at Columbia,

is to be the scene of hydraulic mining operations, the ground, but a few acres in all, having been sold to T. C. Crawford, of London, who is interested in mines on the Mother Lode near Jamestown. The work of exhuming the remains of the dead from the church cemetery has been finished, and the brick edifice will be razed to the ground. This spot is probably the only piece of virgin ground in that neighborhood, and is known to contain gold in paying quantity, the land surrounding the premises having long since been entirely overturned by the placer miners. Secret efforts were once made to extract some of the rich gravel from the church lot by means of a tunnel driven from adjoining property. It is even asserted that the bricks of the old edifice contain gold, having been made from auriferous clay of a nearby hill which was subsequently mined. It is reported that rich ore has been found in the New Albany mine, one of the group of properties owned and operated by the United Mines Corporation. A deep shaft is to be sunk at the Hidden Treasure mine, in the Groveland district, owned by M. N. Laufenburg, of Stockton, and others. A 2-ft. vein of $8 ore was discovered on the Lone Star group while cross-cutting to tap the Lucky Find vein. The adit will have a length of 350 ft. when the objective point has been reached. The new vein was found 250 ft. from the mouth of the tunnel. It is understood that work here will be increased in the spring. The property is situated a few miles northwest of Confidence, and is owned by J. W. Watters, of Santa Cruz. It is predicted that there will be great mining activity in the vicinity of Crocker's this year, several rich properties opened by prospectors during the last several months having passed to the hands of men having ample funds for development.

Tuolumne, January 14.

COLORADO

CLEAR CREEK COUNTY

(Special Correspondence.)—The Wide Awake mine, on Sherman, recently purchased by Otto Shatz of Denver, is again undergoing development. The adit, now in 500 ft., is to be driven farther. The Ohio and Mapleton claims, on Kelso, have been purchased by Eastern parties, and it is stated that development will be commenced at once. In the breast of the adit an 8-in. streak of ore is exposed that mills 65% lead and 55 oz. silver per ton. Another shipment of galena, consisting of 30 tons, was sent out last week from the Josephine mine. The usual returns of $65 net were realized. Work has been resumed in the adit being driven on the Centennial vein, on Leavenworth. A body of mill dirt 12 ft. wide is being followed that averages $14 per ton in gold and silver. All of the electrical equipment for the Malm electro-chemical plant has been placed in position. It is stated that the plant will be ready to start ore treatment some time in February. James Humphrey, who holds the Edgardine property under bond and lease, is developing. The adit is to be driven to cut under the old shaft where ore was mined that milled as high as $300 to the ton in gold and silver. Griffith & Co., leasing on the seventh level of the Little Mattie, made a shipment last week that sampled 5.02 oz. gold and 16.50 oz. silver to the ton. The Treasure Vault, on Seaton, at Idaho Springs, is producing the highest grade ore milled in Clear Creek county. A shipment was made last week that assayed $200 per ton. One ton of first class is now sacked that will mill close to $2000 per ton. R. R. Graham & Co. are owners. A car of ore from the Kinda mine last week sampled $35 per ton. The Ben Harrison, at Freeland, is now a steady shipper. Ten tons of ore is being broken daily that assays $60 per ton.

Georgetown, January 11.

GILPIN COUNTY

The ore shipments at Black Hawk from Gilpin county mines for 12 months, from December 1909, to November 1910, inclusive, are as follows: December, 2875 tons; January, 3175; February, 3075; March, 3275; April, 3350; May, 2600; June, 2850; July, 1900; August, 2175; September, 2075; October, 2150; November, 2275 tons, making a total for the year of 31,765 tons of crude ore and concentrate. To this should be added 23,000 tons hauled from Gilpin county mines to Idaho Springs, and 2280 tons shipped at a station on the Moffat railroad, giving a total of 57,045 tons shipped from this county.

LAKE COUNTY

The Iron-Silver M. Co., the properties of which are on California gulch, Leadville, is having exploration work done from the Tucson shaft. This prospecting is being extended into the blue limestone to find bodies of zinc-carbonate believed to exist there. Similar work is to be carried on from other shafts of this company for the same purpose. Work on the Progressive group, on Fryer hill, is to be resumed this month. The property is now in control of the Mound City Mines Co. of St. Louis, for which H. L. Sisty is manager. The surface plant is being put in order, and the first work will be to unwater the shaft, and this is to be followed by an examination, and exploration work. Recent development on the New Monarch, Little Ellen hill, has resulted in opening several veins of ore, varying from 4 in. to 2 ft. in width; the lowest samples showed $15 per ton. The Little Chief, on Fryer hill, has been leased to M. L. Hoffer, who has sunk a new shaft 145 ft., and intends to continue sinking till he reaches 300 ft.; driving for the ore will be started at the latter depth. The Durkin mine, Fryer hill, has a big body of lead-carbonate ore which was exposed by the caving of an old iron stope. E. Brady and partners, the lessees, have made a drift some distance in the orebody and are making shipments. The Helena, on Iowa gulch, is being prepared for the installation of an electric pump in the main shaft. A cave that occurred in the higher workings exposed lead ore, considerable of which is being hoisted. The Matchless shaft has been retimbered, and the miners now employed are taking out 50 tons of ore daily. The Big Chief, on Carbonate hill, has a body of zinc-carbonate on one of the upper levels, and exploration on the lower levels is in progress to discover similar ore that is believed to extend into this property from mines lower on the hill. Shipments of zinc and lead ores from the Big Chief amount to 75 tons per day.

MINERAL COUNTY

The Commodore mine, at Creede, which belongs to A. E. Reynolds and others, is being operated this year by the owners, under the superintendency of Harry Van Horn. Previous to December 1 the property had been worked for a long time by lessees. The Amethyst is in the hands of a new company.

SAN JUAN COUNTY

The Iowa-Tiger Leasing Co. mined and concentrated 3000 tons of ore in December, shipping 425 tons of concentrate, that sampled about 0.9 oz. gold, 8 oz. silver, and 45% lead. For the two years ended December 31, 1910, the Iowa and Tiger mines, from which the product above mentioned was taken, produced ore valued at $400,000, and the lessees on the property in that time paid the Iowa Gold M. & M. Co. $50,000 in royalties. Those mines are in Silver Lake basin, at an altitude of 12,000 ft. above sea-level, and about 2200 ft. higher than the railroad track on the Animas river. The mill is situated half way between the mine and the railroad; an aerial tramway, about two miles in length, serves for transporting ore to the mill and concentrate to the railroad branch extending from Silverton to Eureka. The names of the other mines of the Silverton region, from which concentrate was shipped in December, are as follows: Ledge, 475 tons; Colorado & Arizona, 150; Hercules, 825; A. Pearson, 50; Sunnyside, 175; E. Zanoni, 50; Silver Lake, 125 tons. The Dives lease, Shenandoah, Queen City, Brooklin, Green Mountain, Yankee Girl, and others produced an aggregate of 400 tons for the month, which was shipped crude. A number of mines which are closed down for the winter are expected to be put in operation later in the year, among which is the Highland Mary, which is opened by adits on Cunningham gulch. There has been considerable activity in this region the past few months, though the work is mostly done by lessees. One of the important operations is the driving of the Joker tunnel.

IDAHO

BEAR LAKE COUNTY

L. A. Jeffs and M. S. Duffield of Salt Lake are opening a deposit of calcium phosphate near Paris, and they expect to find a market for a considerable tonnage of it in California for use as a fertilizer. The Oregon Short Line Co. is building a 12-mile branch from Montpelier to Paris.

LEMHI COUNTY

The Leesburg Gold M. & M. Co., which owns and operates the Italian mine at Leesburg, has opened a 20-ft. vein of ore, samples of which assay $75 per ton in gold. This ore was found at a depth of 95 ft. The company has a 30-stamp mill on the property, and employs about 40 men. Equipment for electric power is being provided. Leesburg is 15 to 20 miles west of Salmon City. The Allie M. Co., operating at Gilmore, contemplates erecting a mill for crushing and cyaniding gold ore, of which it is estimated to have 18,000 tons accessible, that assays about $13 per ton.

SHOSHONE COUNTY

(Special Correspondence.)—The Marsh M. Co., for which A. A. Booth is manager, has leased the mill of the Pittsburg Lead Co., situated on Nine-Mile creek, three miles from Wallace. Some new machinery is to be installed and the mill will be put in operation about April 1. The Marsh mine is at Burke. The Knickerbocker Mines Co. of Spokane is developing the Charles Dickens property near Kellogg, and in sinking a winze from the No. 3 adit a vein of shipping and milling ore was opened. The depth of the winze is 120 ft., and it is to be sunk deeper. The new working shaft, sinking on which began some time ago, is to be sunk farther by contract. James Neilson, E. H. Averill, W. H. Winfree, Edward Evans, F. G. Morrison, and C. Van der Zwaal are among those interested. A 2000-ft. adit has been driven on the Echo ground, near the Hercules mine at Burke, the heading of which is expected to cut the vein at a short distance farther. The Echo is controlled by persons in the Coeur d'Alene. Work has been resumed on the Butte & Coeur d'Alene mine, which has a 400-ft. shaft. Present work consists of driving on the 400-ft. level. Several lots of lead-silver ore have recently been shipped.

MONTANA

BROADWATER COUNTY

(Special Correspondence.)—The Ohio-Keating G. M. Co., having eight claims in Radersburg district, is to resume operations about February 1. The electric power line has been extended from the Keating to the Ohio-Keating, and the shaft equipment is said to be ready for using the power. The property has been opened to a depth of 220 ft., the last 100 ft. being in ore of commercial value. R. M. Calkins, of Seattle, George M. Borquin, W. H. Penfield, C. H. Smith, and J. F. Oppenheimer of Butte are directors of the company.

Radersburg, January 9.

SILVER BOW COUNTY

(Telegraphic Correspondence.)—The fire which broke out on the 1200-ft. level of the High-Ore mine January 14, is the most serious in its possible consequence of any fire in the history of the camp. The High-Ore drains all of the Amalgamated mines. There are numerous connections with all the other mines. The gas drove out all the miners from the North Butte, Mountain View, Modoc, and other mines. Through the courtesy of the Butte-Ballaklava Copper Co. the fire is now being fought from that property, as it is the only point from which the fire can be reached, since the shaft affords the strong down draft. This shaft was promptly tendered, and turned over to the Anaconda company for this purpose, and the air-line has been converted into a water-line for making hose connections in order that the streams of water might be thrown on the fire. The fire stopped the pumps on the 2800-ft. level of the High-Ore mine and drove out the men from the main central pumping plant of the Amalgamated company on the 2200-ft. level. The water pumps are now working, but on the 2800-ft. level, though no longer flooded, the pumps are still out of commission. Guards have been placed at connecting workings and several of the mines can now be worked. The Ballaklava mine is free from fire and smoke, as it was promptly bulkheaded against the fire until the Anaconda company was allowed to tear down the fire doors to get access to the fire area. The lower levels are flooded as a result of the generosity of the Butte-Ballaklava company in turning the air-line over to the Anaconda company, thus stopping the Ballaklava pumps.

Butte, January 18.

NEVADA

CHURCHILL COUNTY

The Nevada Hills Con. M. Co. is sinking a new 3-compartment shaft which is to serve the two mines of the company—the Fairview and the Eagle. The new shaft has a collar of concrete, and a steel head-frame is to be erected. The flow of water into the lower workings has increased, and the company is figuring on an increase of its pumping facilities. The extension of the electric-power line to Fairview is in progress.

LYON COUNTY

The Mason Valley Mines Co. is making progress with the work of constructing its smelting plant at Wabuska to smelt the ores of Yerington district. Thus far the work has been confined to putting in the concrete foundations for the principal buildings, including those for ore-bins and warehouse. The plant is being constructed under direction of Jules Lebarthe, who is reported as stating that power is to be supplied by the Truckee General Electric Co., which is to extend its transmission line from Virginia City to Wabuska.

WHITE PINE COUNTY

(Special Correspondence.)—It is expected that the Steptoe Valley Smelting & Mining Co. will try California fuel-oil under its No. 5 reverberatory furnace, and if found satisfactory it will equip its entire plant for using this fuel.

Ely, Nevada.

The storage tanks are situated at such an elevation as will permit oil to be supplied to the entire plant by gravity, and if the experiment prove satisfactory supply pipes will be laid to all parts of the plant. The question of fuel-supply has always been an important matter with the Steptoe company. Even with the waste-heat boilers at the furnaces it requires an enormous amount of coal to make steam for the generation of the 5000 hp. which is the average requirement of the plant. All coal is shipped from Wyoming and Utah, and as it is necessary to maintain a large supply, considerable loss has resulted from fires in the stockpile and from deterioration. It is estimated that the Steptoe plant would require about 1500 bbl. of oil per day if the plant were equipped for oil burning; and it is possible that all engines of the Nevada Northern railroad and the dinky engines engaged in the removal of the overburden at Copper Flat, as well as the steam-shovel engines, may be equipped with oil burners. The cost of installation will be large, but if a saving can be made, and a more satisfactory fuel secured, it will prove a good investment in the end.

The milling of tungsten ore by the United States company, operating near Osceola, is a new industry in Nevada.

which promises to be of much importance. It is expected that the first shipment of concentrate will be made to New York within a few days. The crude ore contains from 1 to 50% tungstic acid. The mill has a capacity for handling 100 tons of ore per day, being equipped with crusher, coarse and fine rolls, jigs, Wilfley tables, and Isbell vanners. Water is supplied by a 6000-ft. ditch, discharging into a pipe-line 600 ft. above the plant. The property is opened by a tunnel, and the mining is done by air-drills operated by a water-driven compressor. The ore is trammed from the tunnel directly to the ore-bins at the mill. The vein crops frequently along the surface for a long distance, apparently showing the best ore at higher elevations. It is probable that mining this class of ore will prove very profitable to the company. E. L. Fletcher of Ely is the manager, and the company is controlled by Oscar A. Turner, formerly of Tonopah, and his associates of Philadelphia and Baltimore. The Telluride Power Co. contemplates erecting a power plant on Cleveland creek, about 30 miles east of Ely, where it is proposed to generate 2000 to 3000 hp. for the Giroux company of this district. This power company, however, has no connection with the Giroux company. The stream from which the water will be taken is one of the largest in this section of the State, and has a constant flow of water throughout the year. The project has been inspected by engineers, who have made favorable reports. It is estimated that 400 tons of pipe, machinery, and other material will be required in the construction of the plant. It is stated that construction work will be commenced on the plant next spring.

Ely, January 7.

OREGON

BAKER COUNTY

The Bonanza mine and 10 stamps of the mill are being operated by Henry Dodson as lessee, who is reported as being successful. The Bonanza was opened by Geiser brothers 15 years ago, who operated it five years at a great profit. They sold the mine to a company of Eastern men, who failed to find the tonnage of pay-ore that the mine was supposed to contain, and after having performed considerable development work closed it down. It is situated close to Whitney, on the Sumpter Valley railroad.

GRANT COUNTY

The Cougar mine, near Granite, was recently examined and sampled, and this fact is taken as evidence that a proposal to purchase the property is under consideration by people representing a smelting company.

UTAH

BEAVER COUNTY

(Special Correspondence.)—The Horn Silver mill will be ready to commence treating ore the first week in February. The new machinery is being installed in an old building, and while some of the old machinery is being used, the entire scheme of treatment is new. The South Utah is producing one and a half cars of concentrate daily, and it is reported that its copper production for December was 380,000 pounds.

Frisco, January 12.

JUAB COUNTY

(Special Correspondence.)—Sioux Consolidated declared a dividend of 4c. per share last December, making the total for the year a little short of $120,000. The mine's production came from one claim. The old board was re-elected at the annual meeting. The treasurer's report showed cash on hand amounting to $82,409.99. The Edmunds Exploration Co. intends to prospect in the northeastern part of Tintic district. A contract has been let to sink a 100-ft. shaft which may be continued to a depth of 500 ft. The ground is at the base of Pinion ridge, and the shaft is being sunk between two fissures in limestone. The King William, which is being developed from the Eagle & Bluebell's 1900-ft. level, has workings in blue limestone which constitutes the ore-bearing formation.

Eureka, January 14.

SALT LAKE COUNTY

(Special Correspondence.)—The Utah Apex has made an important discovery of copper and lead ore in its Parvenu tunnel and in a raise from the No. 7 level. Regarding a recent suit filed against this company by the Bingham-Mary, an official states that the Bingham-Mary or any other company interested is free to make a survey of its workings. The Edmunds Exploration Co., headed by J. E. Edmunds, has acquired the Copper Glance and Bingham Amalgamated and will commence work on them in the spring. Part of the old workings will be extended to open orebodies known to exist at greater depth. The Montana-Bingham has found ore in its south drift that assays $6 in gold, 8 oz. silver,

Utah Apex Mine.

and 12% copper. The main cross-cut heading is now 260 ft. from the Quinn fissure, in which it is thought rich ore will be found on being intersected by this cross-cut.

Bingham, January 14.

(Special Correspondence.)—It is reported that high-grade ore has been found on the lower levels of the Honerine, the upper levels of which yielded ore of similar grade several years ago. The Kearsarge, in Dry Canyon, near Stockton, has shipped a carload of ore that will sample $60 per ton. The mine force is to be increased next spring. The Ophir Hill Consolidated has commenced driving a 3000-ft. drain and transportation tunnel. Work of extracting ore has been suspended and efforts are centred on the tunnel work. A shaft is being sunk which will give two additional working faces. The tunnel will drain the mine and give 300 to 400 ft. additional stoping ground.

Stockton, January 15.

(Special Correspondence.)—The Utah Mines Coalition Co. has installed equipment for electric power at its mines in Big Cottonwood, and derives its power from the new hydro-electric plant in Provo canyon. The Columbus Extension Co. has opened high-grade copper ore in a drift off the main tunnel, the latter's heading having been in ore for the last 100 ft. It is now within 50 ft. of the contact for which it is being driven; when completed it will be 4000 ft. long.

Alta, January 12.

The Midvale concentrating and electrostatic separating plant of the United States S. R. & M. Co., besides operating on lead-zinc-iron ores from its own mines, is to be a custom plant in part. The old Winnemucca mill in Bingham canyon has been leased to Werner Ziegler, who intends operating it on custom ore. The mill has equipment for 150 tons capacity, and the plan is to concentrate low-grade lead-silver and copper ores.

SUMMIT COUNTY

(Special Correspondence.)—At Park City the latest rumor is that the Ontario and the Daly are to be consolidated. Both have been great mines, but in late years have been in the hands of lessees. Daly West for the first eleven months of 1910, shipped about 27,000 tons of ore and concentrate; Daly-Judge shipments aggregated 23,500 tons.

The Daly West has a number of leases in force under a new lease agreement. The stockholders of the Uintah-Treasure Hill Co. met and endorsed the action of the directors in selling the property to the Silver King Coalition Co. for $100,000, which amount is to be paid in two equal installments. A small force of men has been put to work at the California mine in Thane's canyon. The zinc ore on the dump at this mine is to be shipped to the United States company's Midvale plant for treatment.

Park City, January 14.

TOOELE COUNTY

(Special Correspondence.)—The Tooele plant is smelting about 600 tons of copper ore daily, this being the amount received from Utah Consolidated and South Utah mines, the latter's product being concentrate. This is about half the tonnage that it was expected to treat, the difference being due chiefly to the falling off in shipments from the Utah Con. It is stated, however, that the latter company is shipping ore of better grade than for some time, so that production is not affected as much as the tonnage would indicate.

Tooele, January 14.

WASHINGTON

FERRY COUNTY

(Special Correspondence.)—Walter E. Trent, of Los Angeles, has taken a bond on the Mountain Lion property, situated in the northern part of Republic district. It is reported that the mill is to be remodeled and re-equipped. The Mountain Lion was developed and equipped several years ago by Jonathan Bourne and associates, but is now owned by J. C. Larson of Ottawa. The North Washington Power & Reduction Co. is erecting a cyanide plant in this district; and the Rathfon cyanide mill is being operated on tailing of the old Republic mill. The Insurgent Leasing Co., operating on Eureka gulch, is shipping ore that assays about $25 per ton. E. J. Delbar and Merrill Bros. are the principals in the company. J. L. Harper, manager for the Republic Mines Corporation, and his associates, have secured control of the San Poil and North San Poil groups, situated on the west side of Eureka gulch. The Republic Mines Corporation has acquired the Morning Glory claims at $25,000. In driving on the 400-ft. level of the Quilp mine a new ore-shoot was opened, exposing ore 7 ft. wide.

Republic, January 14.

The mining properties being operated and developed in Orient district comprise the First Thought, Swamp King, Kettle River, First Thought Extension, Second Thought, Buckskin, Alice E., Chickamun, North Star, McKinley, and Napoleon. The building of a mill on the Napoleon is said to have been planned.

SPOKANE COUNTY

Prospectors and other mining men are anxiously awaiting the passage by Congress of a measure whereby the mineral lands of the Spokane Indian reservation will be opened to entry. The territory proposed to be opened contains some lodes and deposits of silver, copper, and tungsten.

CANADA

BRITISH COLUMBIA

(Special Correspondence.)—W. H. Aldridge has resigned as managing director of the Consolidated M. & S. Co. of Canada, Ltd., and will become associated with William B. Thompson & Co. of New York. R. H. Stewart has been promoted to general manager, and S. G. Blaylock to assistant general manager, both to have offices at Trail. In order to encourage the copper-mining industry, the Government at Ottawa has ruled that no royalty shall be charged on products of copper-mining locations for a period of ten years. The shipments of ore from Rossland district during the week ended December 31 were as follows: Centre Star, 2930 tons; Blue Bird, 30; Le Roi No. 2, Ltd., 376; Le Roi No. 2 (milled), 300; Le Roi, 118; Mayflower, 30 tons.

Rossland, January 7.

(Special Correspondence.)—The Kootenay Gold Mines, Limited, has taken over the Granite-Poorman mines and mill. The intention is to double the capacity of the stamp-mill (now 20 stamps) and cyanide plant. Thos. Gough, E. E. Guille, and others are directors. Over 25 men are working at the Athabasca and the mill has been started. The first gold brick was taken to Nelson last week. Ore is ready for shipment from the California and King George V. properties. The compressor will soon be in operation on the Perrier. A body of rich ore has been found at the Nugget mine, Sheep Creek. On the No. 3 level a drift has been run nearly 500 ft. on a shoot of ore averaging $26 per ton. An option has been given for a short time on the Alpha mine, adjoining the Standard, near Silverton. The figure named is $50,000. A 5-ft. vein of ore was found at the Tiger near Ainsworth.

Nelson, January 7.

(Special Correspondence.)—At a recent meeting of the directors of the B. C. Copper Co. the question of declaring a dividend was left over until the meeting to be held in January. It is claimed the company has nearly $300,000 in its dividend fund. The operations of this company's mines and smelter for November resulted in the production of about 917,994 lb. copper, 10,794 oz. silver, and 2845 oz. gold. Copper cost was 9.42c. per pound. The shipments of ore from the Boundary district for the week ended December 31 were as follows: Granby, 29,539 tons; Jackpot, 420; Mother Lode, 8234; No. 7, 50; Nickel Plate (milled) 1000; Rawhide, 4000; Snowshoe, 2343 tons.

Phoenix, January 7.

ONTARIO

(Special Correspondence.)—At a meeting of the Tisdale Mining Co., Frank C. Armstrong of New York was elected president; E. P. Earle, president of the Nipissing Mines Co., vice-president, and D. Lorne McGibbon of Montreal, and Samuel J. Dobie of Haileybury, directors. This company takes over the properties of the Armstrong-McGibbon Syndicate: the 17 Dobie claims in Tisdale township, Porcupine Mining District. All of the unissued treasury stock was taken up by the original syndicate, which also undertakes to provide the necessary money to develop the property. Charles E. Watson, who has been identified with the management of some of the properties in the Cobalt district, has become manager for the Tisdale Mining Company.

Porcupine, January 5.

MEXICO

CHIHUAHUA

(Special Correspondence.)—The Rio Piata Mining Co. shipped in the month of December 78,000 oz. silver bullion from its mine in the western part of Chihuahua. On account of the insurrection in that State, the silver could not be shipped to the city of Chihuahua in the usual way, but had to be carried by pack-mules westward to Alamos, which is on a branch of the Southern Pacific railroad, over which it was shipped to Guaymas and thence by water to Manzanillo. It was then sent by rail to the refinery at Monterey.

Chihuahua, January 10.

SONORA

The Butters cyanide plant, in Minas Prietas district, has been leased to the Mines Company of America, operating the Creston-Colorado mines in that district. The acquisition of the Butters plant, which has a monthly capacity of 7000 tons, gives the company facilities for milling 16,000 tons per month.

SINALOA

The Carcol Mining Co., in which R. J. Coleman and A. J. Bettles, of Salt Lake, Utah, are interested, has a partly developed mine and a mill of 30 tons capacity, situated 55 miles east of Rosario. Development work, in charge of Mr. Coleman, has been going on during the past two years. The ores contain gold and silver, some samples assaying 25 oz. gold and 1500 oz. silver per ton. The mill is to be remodeled, and cyanide equipment installed. Rasario, an old town, is now on the line of the Southern Pacific railroad.

GOLD AND SILVER MINING IN 1910

In a preliminary review of the gold and silver industry in the United States in 1910, the United States Geological Survey presents the following data, compiled by H. D. McCaskey: Preliminary statistics compiled by the Director of the Mint indicate that in 1910 the value of the total production of gold in the United States (including Alaska and the insular possessions) was $96,055,214, a decrease of $3,618,186 from the value of the output in 1909, which was $99,673,400. Notwithstanding this decrease, the gold-mining industry was on the whole and during most of the year progressive and in a satisfactory condition. Important increases in production are indicated for California, Nevada, and Arizona, and smaller increases for New Mexico, North Carolina, South Carolina, Utah, and Washington. Serious curtailment of copper production would of course affect the gold output, particularly in Montana and Arizona, but the total decrease from this cause would be relatively small, as the great bulk of the gold produced continues to come from placers and dry or siliceous ores. The preliminary figures show that Colorado has lost first place to California and now stands second, and that Alaska has lost third place to Nevada and now stands fourth. South Dakota and Utah remain fifth and sixth, respectively, in order of gold production, but Arizona has changed places with Montana, and these States now stand respectively seventh and eighth in order of output. In Alaska there was a total decrease of $3,350,000 in the value of the output of gold, but a marked increase in gold lode mining, particularly in the Juneau district. Placer mining in general was active in Alaska in 1910, and production from old districts and prospecting of new fields continued to be features of the industry. In Arizona the increase in gold production in 1910, amounting to over $600,000, was due largely to activity in the Gold Road and Tom Reed mines, in Mohave county, but is to be ascribed partly also to increase in the production of copper, in which Arizona ranked first in 1910.

In California an increase in value of gold production is due largely to continued success in gold dredging and to the maintenance of output from the Mother Lode mines. In Colorado a decrease in gold production was shown in the recovery from both milling and smelting ore, but was due mainly to partial temporary suspension of deep mining in Cripple Creek pending the completion of the great Roosevelt drainage tunnel. In Idaho and Montana decreases in gold production are indicated. In Idaho gold production decreased generally, but particularly in Idaho county; and in Montana decrease was expected as a result both of decreased output of copper at Butte and to a smaller degree of decreased production from siliceous ores in Chouteau and Fergus counties. There was an increase of gold production in Montana, however—from siliceous ores in Deer Lodge county and from iron sulphides in Broadwater county. Dredging operations in these two States remained active in 1910. In Nevada the statistics indicate an increase of over $1,500,000 in gold production in 1910 over that of 1909, due chiefly to an important increase in production by the Goldfield Consolidated mines. Jarbidge, National, and other new camps attracted much interest in 1910, and Esmeralda, Humboldt, and Whitepine counties in general show increased production for the year. In New Mexico an increase in gold production is indicated by early returns. In Oregon preliminary figures show a decrease in gold output. In this State the production of gold from placers has been decreasing, and although the deep mines have produced a greater quantity of ore, the grade has been generally lowered during the last few years. In South Dakota labor troubles in the early part of 1910 continued to militate somewhat against the full production of the gold mines of the Black Hills, and a decrease in value of about $1,400,000 for the year is indicated for the State.

In Utah the production of gold in 1910 was slightly above that of 1909, when the value of the output was $4,213,300. The mining industry in all the great camps was in a flourishing condition during the year. The output of copper and zinc in Utah was in 1910 materially increased, and the production of gold profited by this increase. In Washington there was an increase of $280,000 in value of output of gold, due to increased activity in the Republic district.

The production of gold in the Southern States in 1910 indicates decrease in Georgia and Virginia and increase in North and South Carolina, each being due largely to the operations of one mine. The gold output of Alabama, Tennessee, and Texas shows little change in 1910. In the Philippines a material decrease is indicated, from $247,600 in 1909 to $90,357 in 1910.

The production of silver in 1910 in the United States, as indicated by preliminary figures compiled by the Director of the Mint, was 56,438,695 fine ounces, an increase over the production of 1909 of 1,717,195 fine ounces. This increase, if borne out by final figures, must be credited to increased production of silver from dry and siliceous gold-silver ores, from lead ores, and, to a smaller degree, from zinc ores, as the production of copper, the ores of which supply nearly a third of the silver output of the United States, was somewhat decreased in 1910. The production of both lead and zinc, however, increased in 1910. The average price of copper was slightly lower than in 1909, the average price of lead was increased, and that of spelter remained the same. The rather remarkable decrease in both the quantity and the price of copper and the increase in both the quantity and price of lead in 1910 were accompanied by an increase in both the quantity of silver produced and in the average price of the metal. The value of the silver production of 1910 is estimated at $30,194,702, the increase being $1,739,502. The average price for silver in 1909 was 52c. per fine ounce. The domestic market price for silver has averaged 58c. per fine ounce for the last ten years, and during this same period the average annual domestic production has been 55,543,200 fine ounces.

With the decrease, since the bonanza days of the Comstock and other silver mines, of production from ores essentially classed as silver ores and the serious decline in market price, the production of silver in the United States has shown a certain independence of its market price and has depended rather on the mining of gold, copper, lead, and mixed ores. With satisfactory prices for the base metals and decreasing costs for mining and smelting them on a large scale, and with the general increasing gold production of recent years, silver production may therefore be expected to continue to increase in the United States, notwithstanding the growing production from Mexico and Canada and the higher tax imposed on silver by the Indian Government. The silver market itself has been inviting during 1910, however, as indicated by higher average market prices. Large crops in China and India, growth of trade throughout the world, and a tendency to greater use of silver in the arts—as, for instance, in photography—have sustained the price and held out hope for the immediate future. As the output of silver is intimately connected with the mining of other metals, its own active market augurs well for mining in general and is widely reflected throughout the industry. The most notable increase in the silver production of any individual State in 1910 as indicated by the preliminary mint figures, is that of 1,225,346 fine ounces in California. These figures are subject to revision, however, as the copper production of this State is known to have decreased considerably in 1910, and as no other source for so large an increased silver output in California is known. An increase of 312,041 fine ounces is indicated for Arizona, where copper mining and smelting have been active. Increases of about 359,000 and 691,000 fine ounces are indicated for New Mexico and Utah, respectively. In Utah there was an important increase in the output of copper and zinc, that of copper tending to augment the silver production, but a decrease in the output of lead, which would correspondingly reduce the silver output. In Washington an increase in silver production of over 100,000 fine ounces, or more than 100 per cent, is indicated, and if borne out by final figures will probably be

found to be credited largely to the Republic district. An increase of about 50,000 fine ounces is also apparently to be credited to Michigan, although copper production is known to have decreased somewhat in that State in 1910.

Decreases in the production of silver in 1910 are indicated in Alaska, where it would be expected as incidental in part to decreased gold production; in Colorado, where it was relatively small and not unexpected; in Idaho, where the falling off was also relatively small and may possibly be ascribed to the decreased tenor of silver in lead ores, as these ores furnish the bulk of the silver output of Idaho and the production of lead is thought to have increased in this State in 1910; in Montana, where the indicated decrease is over 400,000 fine ounces and is probably due largely to decreased copper production; in Nevada, where the preliminary figures indicate a decrease of nearly 773,000 fine ounces, possibly due to decreased production of silicious and lead ores and in the face of a known increase in copper production; in Oregon and Texas, where the change indicated is nominal; and in South Dakota, where a decrease was looked for in sympathy with decreased gold production.

According to estimates made by the Bureau of Statistics, the imports in 1910 were valued at $29,599,000 for silver in foreign ore, $12,703,000 for silver in foreign bullion, $2,011,000 for silver in United States coin, and $1,097,000 for silver in foreign coin. The total value of silver imported is therefore estimated at $45,410,000 for 1910. The exports during the same year were valued at $350,000 for silver in domestic ore, $30,000 for silver in foreign ore, $51,820,000 for silver in domestic bullion, $3,100,000 for silver in foreign bullion, $120,000 for silver in United States coin, and $550,000 for silver in foreign coin. The total value of silver in exports in 1910 is estimated, therefore, at $55,970,000, or $10,560,000 in excess of the value of the imports. In 1909 the value of the excess of exports over imports of silver was $11,404,607, and in 1908 it was $9,613,541; previous to 1908 it had not been below $15,000,000 for several years. The imports of silver in 1910 were, as usual, chiefly in ore and bullion and came mainly from Mexico and Canada. The exports were almost wholly in ore and bullion, and went, as usual, chiefly to the United Kingdom and in smaller amounts to Hongkong and France.

The mining industry of Utah during the year 1910 was in a flourishing condition. The gold, silver, copper, lead, and zinc produced will aggregate in value fully $33,000,000, an increase over the value for 1909, which was $31,380,092. Eighteen mining companies paid dividends of over $8,000,000. The largest single dividend payer was the Utah Copper Co., which distributed over $4,500,000. Approximately 6,163,089 tons of ore was mined and treated in 1910, an amount greater than that mined and treated in 1909, which was 5,122,589 tons. The quantity of ore mined has been increasing each year since the steam-shovel was first employed at the copper mines in the Bingham camp. Fully 70% of the ore mined in Utah in 1910 was derived from the porphyry deposits at Bingham, where 17 steam-shovels were at work. About 11% of the ore mined in the State was shipped directly to the smelters. The greater part of the remainder was treated at concentration plants, a comparatively small portion having been sent to amalgamation and cyanide mills. The copper producers, who have been striving to reach an output that shall be classed as normal, increased the production of copper to about 126,000,000 lb. in 1910. This is the record output for Utah, and is about 14,000,000 lb. greater than the mine production of 1909, but is still under the yearly production that may be maintained, judging from preparations being made by the heaviest producers of copper, who continue to add to milling and mining equipment.

The production of gold and silver was considerably increased in Utah in 1910 through the increased output of copper and zinc, but this increase was somewhat offset by a decrease of production of precious metals due to the decreased lead output. Early reports on the production of bullion and precipitates of amalgamation and cyanide mills show an increase in the production of gold in 1910 over the output from these sources (29,861.43 fine ounces) in 1909, the output for 1910 being approximately 35,196.97 fine ounces. Therefore, judging from the facts given, the State's output of both gold and silver has increased in 1910. Zinc ores and concentrate shipped from Utah in 1910 to Colorado, Kansas, Oklahoma, Wisconsin, Ohio, and West Virginia contained approximately 16,513,877 lb. of zinc, which was used in the manufacture of spelter and pigment. The producers of zinc were the Daly West, Daly-Judge, and United States mines at Bingham, and the Scranton, Horn Silver, Cedar Talisman, and numerous small tailing plants at Park City.

In Colorado in 1910, as compared with 1909, silver production increased slightly in value, owing to an increased price per fine ounce in 1910. There was a considerable increase in lead output, but a decrease in the yield of copper. Less gold and silver was recovered both from bullion and from smelting ore. The Globe, Pueblo, Arkansas Valley, and Durango plants of the American Smelting & Refining Co. and the Salida plant of the Ohio & Colorado Smelting Co. were active during the year. The Argo plant of the Boston & Colorado Smelting Co. was closed March 17, 1910, after many years of successful operation, having been established in 1872 at Black Hawk and moved to Argo in 1873. The pyritic smelting plant of the Modern Smelting & Refining Co., started in October 1909, closed May 31, 1910. The pyritic plant at Golden was taken over by the North American Smelter & Mines Co., was blown in April 9, 1910, and operated almost continuously during the year on ore from its own and other mines in Clear Creek county and from other counties in the State.

Whether Montana shall hold its enviable record of being first on the list of copper and silver producers depends much on the yield of the copper mines at Butte. The State headed the copper list in 1909, but is second to Arizona in 1910, although it remains first in the output of silver. The mines of Montana produced approximately 286,000,000 lb. of copper in 1910, a decrease from the yield in 1909, which was 312,056,538 lb. The average monthly production of copper, which in 1909 was about 25,600,000 lb., was reduced to about 23,000,000 lb. per month during the later part of 1910. However, according to a statement issued by the management of the largest interest, the new work and development in the mines will be vigorously carried on and the milling and smelting works at Great Falls and Anaconda will be worked to their full capacity. It is evidently the intention to treat lower-grade ores.

The Mogollon or Cooney district, in the southwest corner of Socorro county, contains several gold mines, chief of which is the Ernestine mine, which is and has been for years the heaviest producer of gold in the Territory. The Socorro Mines Co.'s mill, at Mogollon, was operated throughout the year; and the Helen company and the Treasure Mining & Reduction Co. were also producers in 1910. In the Magdalena district, a lead-zinc camp, in the central-western part of Socorro county, the operations of the Ozark Smelting & Refining Co., the Tri-Bullion Smelting & Development Co., the Germany Mining Co., the Mine Development Co., and the Mistletoe Mining Co. should show an increased output. The 20-stamp mill of the Rosedale Gold Mining Co., at Rosedale, which has been operated on gold ores, was burned in September.

The status of Idaho's mining industry is largely gauged by conditions in the Coeur d'Alene district, in Shoshone county, although these give little conception of the status of gold mining in the State. During 1910 the large lead producers made a normal production of that metal, but as there were several new producers the total output was brought up to about 224,000,000 lb., which exceeds the output of 1909 by 9,000,000 lb. The silver production, closely allied to that of lead, being derived largely from lead ores, remained close to 7,000,000 oz., although in the last four years there has been a gradual decrease in production of silver from lead ores. The closing of the Trade Dollar mine at Silver City has also diminished the silver output slightly.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

DUMP FROM COAL MINES—DAMAGES FOR NUISANCE

The dirt dumped from a coal mine making a permanent pile from 250 to 300 ft. long, 100 ft. wide at the base, and 50 to 60 ft. high, was held to be a permanent nuisance, and that only one action could be maintained for the recovery of damages, and that the measure of damages was the decrease in the value of the property injured thereby.

Risher *v.* Acken Coal Co., (Iowa) 124 Northwestern 764. Feb. 1910.

INJUNCTION TO PREVENT REMOVAL OF OIL

A court of equity has jurisdiction of a suit brought by the senior lessee in an oil lease against the original lessor and a junior lessee of the same land to enjoin the removal of the oil from the leased premises; and in such an action a court may settle all conflicting claims of the lessees and grant such relief to either claimant as the pleadings and proof may warrant.

Smith *v.* Root, (W. Va.) 66 Southeastern 1005. Jan. 1910.

OPTION SALE OF MINES

Where an option agreement for the purchase of coal in place provided that notice of its acceptance should be given in writing, and where the persons having such option took no steps to complete their title for seven years, and the owner retained possession, paid taxes, claimed the title, and gave an option to another person, it was decided that in an action involving the title under the agreement, that the quesions whether the notice of acceptance was given, and whether the option agreement had been abandoned, were questions of fact for the jury to determine.

Cambria Iron Co. *v.* Leidy, (Pa.) 75 Atlantic 186. Jan. 1910.

CONSTRUCTION OF LEASE OF MINE

A lease of fire-clay provided for the payment of ten cents per ton royalty on all coal taken from ten separately described tracts of land; by a course of dealing between the lessor and the leasee a royalty of seven and one-half cents per ton as to certain tracts was paid. Afterward the lessee assigned the lease; but the assignee was not entitled to mine the clay for the seven and one-half cents royalty, because of the course of dealing between the original lessor and lessee, where it did not appear that such assignee had any knowledge of the course of dealing. And where the original lease was changed and thereafter a new lease entered into, such original lease and the lease as changed were merged in the new lease.

Thomas *v.* Harbison-Walker Refractories, (Pa.) 75 Atlantic 199. Jan. 1910.

CONSTRUCTION OF OIL LEASE—ABANDONMENT

An oil lease gave the lessee the right for 10 years to explore for oil and gas, and provided that if a well was not completed on the premises within 3 months from the day of the lease, the lessee should pay to the lessor a quarterly cash rental, in advance, for each additional 3 months the completion of any well was delayed. In an action on the lease it was held to be an executory contract and vested no title in the lessee to the oil and gas in place; that the lease contemplated the development of the premises within a reasonable time, and the lessee could lose his rights thereunder before the expiration of the period stated by abandonment of the lease, though it contained no forfeiture clause, and his intention to abandon the premises could be established by proof of such facts and circumstances as would show a voluntary waiver of his rights.

Smith *v.* Root, (W. Va.) 66 Southeastern 1005. Jan. 1910.

COPPER PRODUCERS' STATEMENT

The Copper Producers' Association's December statement shows a decrease during the month in accumulation in this country of 8,358,874 lb., as follows:

Stock of marketable copper of all kinds on hand at all points in the United States December 1, 1910	130,389,069
Production of marketable copper in the United States from all domestic and foreign sources during December	123,339,219
Deliveries of marketable copper for consumption and export during December	131,698,093
Stock of marketable copper of all kinds on hand and at all points in the United States January 1	122,030,195

December 1910 production and deliveries compare with December 1909 as follows:

	Production.	Deliveries.
December 1910	123,339,219	131,698,093
December 1909	117,828,655	129,066,071

Exports and domestic deliveries compare:

	Exports.	Domestic deliveries.
December 1910	88,104,075	43,594,018
December 1909	59,546,570	69,519,501

TIN MARKET

L. Vogelstein & Co. report that owing to smaller Straits shipments and larger deliveries than anticipated, December tin statistics make a more favorable showing than expected. Deliveries were good on both sides of the Atlantic. Over here they amounted to the unprecedented quantity (for December) of 3600 tons, bringing the total for the year up to the new high record of 45,350 tons. There may be hard times and dull business in other lines, but apparently not in tin, and this in spite of every effort on the part of consumers, big and little to use as little as possible and carry the smallest possible stocks. Still the year closed with only 854 tons on hand, less than one week's supply, and almost all of that was English, Chinese, and sundries—practically no Straits. This will necessitate continued drafts on London, where stocks are closely held and a premium already exists on tin for prompt shipment. As to the future, Straits shipments for January are estimated at 3700 tons, which will probably mean little if any increase in the visible this month, though it is a Banca sale month. Predictions are freely made that the visible will be down to 14,000 tons by the end of April and the price considerably higher than it is today. These predictions are expected to be realized, though fully conceding the dangerous character of the market. While caution is advisable in dealing with tin, that ultra-conservatism which has in the past led many buyers to be chronically short of the market is no more likely to be profitable during the next two or three months than it has been in the recent past. The outlook for some time ahead is for small supplies and occasional stiff spot premiums on top of a general high range of prices.

THE IDITAROD placer district was visited by A. G. Maddren, of the Geological Survey, during the summer of 1910, and the following notes are based on his report. The district is drained by the river of the same name, which is tributary to the Innoko, a confluent of the lower Yukon. The placer-bearing area can be reached in summer by a steamer journey of about 400 miles from the Yukon. There is a more direct winter trail from Holy Cross, on the Yukon, and the district can also be reached by a winter journey of some 450 miles from the town of Seward, on the Pacific seaboard. In the summer of 1910 there were about 2500 people in the district, and the gold output is estimated to have a value of about $350,000. This indicates that the influx of population was out of all proportion to the gold production. It appears that the amount of proved placer ground is not sufficient to support the population now in the district.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

W. S. Noyes is in Oregon.

Howard D. Smith is in New York.

E. P. Kennedy is in San Francisco.

Ralph Arnold has gone to New York.

Oliver B. Finn is now at Colorado Springs.

Bulkley Wells is at Marysville, California.

R. H. Toll is examining mines in Honduras.

R. Y. Hanlon is at Manila, Philippine Islands.

Fred L. Lowell has gone to Chihuahua, Mexico.

F. J. Siebert is at the St. Francis, San Francisco.

Robert H. Richards was in New York early in January.

C. S. Herzig has removed his office to 42 Broadway, New York.

F. M. Meyers is examining mines in Tuolumne county, California.

W. C. Alexander and W. G. Page are at the Van Nuys hotel, Los Angeles.

E. C. Brown expects to go to Lower California to open placers near La Paz.

J. R. Finlay has resigned as general manager for the Goldfield Consolidated.

Reiji Kanda is examining the Okshi beach placers, near Nagasski-Ken, Japan.

Charles A. Griffin has returned from mine examinations near Kingman, Arizona.

Benjamin F. Tibby, of Salt Lake, spent a few days at San Francisco the past week.

Julius Kobig and P. L. Sherman, of Los Angeles, were at the St. Francis, San Francisco.

W. L. Leland has returned to Los Angeles from mine examinations in northern Nevada.

W. W. Whitton is engineer with the Espada Mines Co. of Hostotipaquillo, Jalisco, Mexico.

W. S. Keith is now manager of the mining department of the M. E. Miller Co. of Los Angeles.

Mark B. Kerr has been at San Francisco from the Pittsburg mine near Grass Valley, California.

H. W. Turner is in London, and will go to Russia to examine copper deposits about February first.

James W. Abbott is general manager for the Nevada-Des Moines Mining Co., operating at Pioche, Nevada.

W. C. Austin has returned to Nevada City, California, from an examination of mines at La Dura, Sonora, Mexico.

Wilbur H. Grant has been employed to make a geological survey of the properties of the A. S. & R. Co. near Matehuala, San Luis Potosi, Mexico.

Jay Lonergan has gone to the Imperial Pei-Yang University at Tientsin, China, where he will succeed Thomas T. Read as professor of mining engineering.

Grant B. Shipley, formerly engineer of mining and timber preserving machinery for Allis-Chalmers Co., is now president of the Pittsburg Wood Preserving Company.

P. R. Parker, formerly with the San Francisco office of The Bucyrus Co., is now in charge of the Seattle office of the Yuba Construction Co., at 1224 Alaska building.

H. C. George, who has been director of the Wisconsin State Mining Trade School for the past three years, has resigned to become mining engineer for the Wisconsin Zinc Company.

N. H. Darton, for many years geologist on the United States Geological Survey, has been appointed the geologist of the new United States Bureau of Mines, with headquarters at Washington, D. C. He will continue his investigations of the geological conditions under which explosive gases occur in coal beds.

TABLE OF CONTENTS

EDITORIAL

SEISMOLOGISTS in the United States recently organized the Seismological Society of America and it is now announced that publication of a series of bulletins devoted to earthquake studies is about to be undertaken.

FIRE IN LARGE MINES is the dread of miners, as it is always destructive of property and sometimes of life. A fire which started from some unknown cause in the High Ore mine at Butte, on January 14, resulted in the loss of two lives, and had not prompt measures been taken to prevent it, the fire must have spread to adjoining mines and caused a general suspension of work on Anaconda hill. The Butte miners, however, have had much experience with mine fires and apply heroic remedies, usually with satisfactory results, as in the present instance, for at last accounts the fire was under control.

TWO HUNDRED MILLION DOLLARS is stated to be the value placed on the Parrot mine by the minority stockholders of that Butte, Montana, property. These stockholders are those who are not in accord with the recent sale of the stock of the Parrot company to the Anaconda company at what was, in comparison, merely a nominal sum. The Parrot is in the heart of Butte district and consists of numerous fractional claims, with a total area of a little more than 40 acres, which is the equivalent of about two full-sized claims. However, the value of a mine is not usually determined by its superficial area, but by the size and value of the orebodies. The Parrot company has been in existence about thirty-one years and has paid in that time less than $8,000,000.

ACQUIREMENT by the Consolidated Gold Fields of a controlling interest in the Breyten Collieries in the Ermelo district has been commented upon at Johannesburg. According to local critics, the present rate charged for the ordinary railway carriage of coal from Ermelo, as much as 75c. per ton, will have to be paid in excess of what an equally good steam-coal property could have been acquired for and worked in the Middelburg district, besides which in these times when all the gold mines are reducing their coal requirements to a minimum, the outlook for the coal trade of the Transvaal is not of the brightest. Again, the Breyten Collieries are situated several miles away from the railway, and as several equally good, if not better, properties exist on the line of railway, the construction of a long branch line seems to be an unnecessary expense and to involve waste of working capital.

METALLURGISTS everywhere have read with regret that the Western Association of Technical Chemists and Metallurgists is to disband. In the six years since that society was formed it has made an enviable record. While the membership has been small, the discussions were always stimulating and the papers published in its journal, the *Western Chemist and Metallurgist*, have been of uniformly high character. We hope that those who have been active may continue their interest, working through one of the other established societies. Technical chemists have particular need to guard against being buried under routine work. They should keep their interest in research alive, and to do that nothing aids so much as frequent contact with their fellows. The local sections of the Mining and Metallurgical Society and of the American Chemical Society afford opportunities that professional men can not afford to overlook.

Powder Magazines in Mines

Another instance of the mistaken economy of storing large quantities of nitro-powder in mine workings was afforded a few days since, when the powder stored in a drift near the main shaft on the 200-foot level of the Keating mine at Radersburg, Montana, exploded, killing several men. That more of the men underground in the mine at the time did not lose their lives was due to the fortunate fact that they were enabled to escape through an old shaft at some distance from the scene of the disaster. The cause of the explosion is unknown, but it should never have been possible. The storage of dynamite in mine workings is a reprehensible practice, and State laws usually prohibit it, which is perfectly proper. There are so many instances of the explosion of powder magazines in mine workings that it is surprising that managers continue to store powder underground. Usually no one outside the mine where the disaster has occurred has any knowledge of the underground magazine. Strict rules concerning the handling of powder should be enforced in every mine, for often the men have access to the powder without restriction, and experience has shown that accidents of this kind are fewer where only one or two men are permitted to enter the magazine and to carry powder to and from it.

State Mine Inspector

Once more a bill has been presented in the California legislature providing for the creation of the office of a State inspector of mines, and the appointment of a competent engineer to fill the responsible position. As usual, opposition from the mine-owners is evident. At each legislature for some years past a similar bill has been presented and always defeated, although no one except certain mine owners will deny that such mine inspection is not only desirable, but necessary. Numerous mining States have official mine inspectors, but the attempt to create this office in California has thus far failed. The opponents claim that there would be no particular objection to a State mine inspector if there were any assurance that the inspector would prove to be a capable and honorable man—they have their doubts. Possibly the real cause of this opposition lies in the fear that he may prove to be a capable and honorable man. A State inspector of mines occupies a responsible position. It is his duty to protect the lives and health of the miners, as far as possible, while being just to the owners. Competent and impartial mine inspection would in some cases perhaps increase the cost of mine operation; in others it would reduce it by improving working conditions. Among the duties of the mine inspector is that of examination of hoisting ropes, the investigation of ventilation and the sanitary conditions underground, inquiry as to the storage of explosives in the mines, and a rigid investigation into the cause of accidents. It is his business to see that the State laws are enforced, and beyond this his duty does not extend. It is his privilege to be autocratic, but that is necessary, or his office were better abolished.

Stope-Drill Contest

Competitive tests of machine-drills have long been a periodical feature of mine operation on the Rand. The results of these contests have been published from time to time with elaborate details, but the contest recently ended there was, in our opinion, the only one which was really conclusive in its results, for the reason that instead of merely a few hours drilling, this last contest was continued through a period of nearly a year. Interest in this competition, which was initiated by the always progressive Transvaal Chamber of Mines, was stimulated by the award of a prize of £2500 for the best small drilling machine that could be produced for stoping under conditions existing in the Witwatersrand mines. This premium was increased by an additional offer by the Transvaal Government of £2500, making a total of £5000, the running costs of the contest to be paid jointly by the Chamber of Mines and the Government. A competitive trial of rock-drills operating for a few hours at the surface, drilling holes in granite blocks, is a very different matter from an actual competition of machines which operate throughout a period approximating a year, and meeting the frequently changing conditions incident to the operation of the mines. This is the only fair test of a machine-drill. Nineteen different types of drills were entered for the contest, of which nine were discarded at the preliminary trials made on the surface and later underground, and ten actually entered the trial to continue for 300 shifts. These were the Holman 2⅛ inch, Holman 2¾ inch, Siskol, Climax, Imperial, New Century 0.0., Konomax, Chersen, Waugh, Murphy, and Westfalia.

The stope-drill committee decided the contest on the basis of footage costs, which is the only absolutely fair way in which to arrive at a rational conclusion. Very low footage costs were obtained, notwithstanding that the men running the machines were unfamiliar with them at the start.

Drills of the reciprocating type were awarded first and second place, outclassing those of the ham-

mer type, contrary to the expectations of many. The cost per foot of drilling with the four leading machines was: Holman 2⅛ inch, 9.77 pence; Siskol, 9.90; Holman 2¾ inch, 10.91; and Chersen, 11.94 pence.

In their findings the committee recommended the reciprocating piston machines of lighter weight—120 to 130 pounds—for use in very narrow stopes, those less than three feet, and heavier machines in larger stopes. The drilling-bits should be parallel at the sides and flat for about an inch from the cutting edge.

Utah Geological Survey

A bill has been introduced in the legislature of Utah providing for the establishment of a State Geological Survey. This is an excellent project and deserves success. Utah is one of the few States that has never undertaken a systematic study of its natural resources, and while the United States Geological Survey has done much good work in Utah, as elsewhere, great areas remain practically unexplored, to say nothing of the larger regions that are unsurveyed or unstudied. The creation within a few years of a great copper industry where lead and silver mining were previously dominant, the beginning of zinc mining, and the discovery of phosphate rock, suggest other discoveries and developments that may reasonably be expected when the resources of the whole State become known. There are undoubtedly minerals still to be found, mines to be developed, and camps to be established. Iron occurs, but just how important the deposits are, is not yet certain, despite the fact that a few have been carefully studied by the officers of the United States Geological Survey and engineers in private practice. Petroleum is found, though output is, as yet, unimportant. While the mineral production of Utah is already large and growing, there is no doubt that it is destined to increase rapidly for many years. In the economical exploitation of the mineral resources of the State, accurate maps and detailed reports such as may be furnished by a properly conducted State survey will many times repay the cost. Utah, as is true of most other Western States, owns large amounts of public land and hence has a direct interest in securing an accurate inventory of the mineral wealth within its borders. The geologist, however, is concerned with more things than the finding of orebodies, and under modern conditions a geological survey has many duties aside from those directly related to the mining industry. Maps, and accurate maps, are essential to all geological work, and are in demand for engineering purposes of many sorts. Roads, drainage works, irrigation canals, water storage, these are a few of the features of modern life that call for maps. In an arid State such as Utah, the conservation and economical use of the natural rainfall will always be of first importance, and for this the knowledge of the geologist, as well as his maps, is requisite. Modern industry, too, involves many incidental technical problems. Prevention of pollution of streams by débris, of the air by smoke, preservation of health in the mines, and many similar subjects, require legislation or executive action which should be based on sound advice as to the technical as well as legal and sociological features of the case. In many States the director of the Geological Survey is a constant adviser of the State officers in such matters. Through his own studies, and those of his assistants, he brings to the service of the State accurate knowledge as to most important phases of many of these problems. This, we believe, is a wise development, though it goes without saying that if such duties are to fall upon the head of such a bureau, a well-trained man must be selected for the position, and he must be adequately supported. A dishonest man, a weak man, or one who is incompetent, may do much harm, and in these days when conservation problems are so important and so much to the fore, every State needs the best possible service in this direction.

The form of organization of a State Geological Survey is one concerning which there is much difference of opinion. In general, it is customary to place a bureau under the direction of a separate board or commission, and to give it independent funds. This plan has many advantages. Work which is worth doing is worth doing well, and a Survey that is incidental to other work will be diverted from its main purpose. The disadvantage of the separate commission is that multiplicity of boards divides responsibility. This is being urged in Utah, and it is proposed to make the Survey a part of the School of Mines. With no reflection on the officers and teachers of that excellent school, it may be pointed out that the main purpose of a school is to teach, and the history of such connections elsewhere has been that Survey funds have been diverted, often with but slight return to the Survey, to give the students summer field work. They ought to have such work, but it is wiser to do as in Nevada, where school funds are frankly used for that purpose. Survey work needs the undivided attention of trained men rather than the incidental care of a busy professor aided by student assistants. If, too, a Survey is passed over bodily to a school, it is less directly brought to the attention of the Governor and the Legislature, and is to that extent less useful. Securing an appropriation and being let alone, should not be the chief aim of the head of a Survey, and it is, in practice, an excellent thing to have the Governor in direct touch with the work. In Utah a board consisting of the Governor, the President of the State University, the President of the Agricultural College, and the Director of the State School of Mines, has been proposed, and a board so organized should work well. It has the advantage of being ex-officio, it should be free from politics, and it would bring the Survey into direct friendly relations with both educational interests and the State executive. With such an organization, a competent man should be able to do work of real merit and wide benefit, and such a Survey would be a good investment for Utah or any other State.

ABC of Empire Drilling—II

By J. P. Hutchins and N. C. Stines

***The Drilling Pump.**—As the name indicates, this pump is essentially a tool that drills and pumps simultaneously. The component parts include a barrel, a bale, a stem and coupling, a drilling-bit, and a ball-valve. The barrel is a section of pipe, about 2 ft. long, the outside diameter of which is slightly less than the inside diameter of the drilling or casing pipe. One end has the bale-stem and coupling riveted to it in such a way as to leave an opening through which the content of the pump is dumped. The other end has the drilling-bit screwed into it. The drilling-bit resembles an hour-glass with the top and bottom removed. The lower part has a sharp hard nickel-steel circular drilling-edge. The upper part forms a seat for the hard-steel ball-valve. In the barrel of the pump, a few inches above the valve-seat, is a stop to prevent the ball-valve from falling out when the pump is inverted when dumping.

This tool has the following advantages: (1) The circular bit is an ideal form for a drilling-tool, as it has no corners to break or wear rapidly, and the wear is slow and evenly distributed around its circumference. (2) It has a valve that does not wear, get out of order, or permit the loss of any part of the sample. (3) It requires no dressing or sharpening. (4) As soon as the core is crushed or loosened, it is picked up by the pump and held by the valve; thus all work is effective and no time is lost in unnecessary crushing. (5) As fast as the material is picked up and held by the pump, a fresh surface is constantly being exposed and no energy is wasted, as happens when drilling with an ordinary drill-bit through an accumulation of crushed material. (6) As the material is picked up with a minimum of crushing, its characteristics, and those of its valuable content, undergo a minimum of change; they are, therefore, more easily interpreted and there is no loss, due to attrition, of the valuable content.

This tool is used nearly all the time. It will crush any boulder that enters the pipe, even though it may be longer on its axes than the inside diameter of the pipe.

Its disadvantages are: (1) It is somewhat difficult to empty because of the projections of the bale where it is riveted to the inside of the barrel. This is due to design and can be easily remedied by leaving a flush screw-joint. (2) It does not work well in solid clay, as it is hard to get the clay out of it. (3) In some kinds of sand it does not work well, and it is then proper to substitute the helical-pocket-pump, which is designed particularly for penetrating sand.

Drilling Under Various Conditions.—As a means of illustrating the complete cycle of operations of the Empire-drill outfit under various conditions met with in prospecting, this hole will be continued as a hypothetical hole, and the various tools, their use and operation, will be described. Difficulties such as are met in practice will be assumed to occur and the means of overcoming them explained.

*Continued from *Mining and Scientific Press*, p. 43.

Drilling Medium Ground.—Assume that gravel of fine to medium size and loose to medium tightness is being penetrated. Under such conditions the drilling-pump is used and the hole can be sunk at the rate of about 25 to 50 ft. per 10 hours. Assume that the first length of pipe has sunk until the platform is almost touching the ground, the horse-power pin is taken out, the horse-power lifted by two men and set out of the way. A pair of chain-tongs is so placed on the pipe and held as to prevent it from rotating backward as the platform is turned in that direction. This breaks the joint between the pipe-head and the pipe. The platform is lifted off and placed to one side, and the pipe-head is unscrewed by hand. Another length of pipe, with clean and oiled threads, is screwed on to the piece of pipe projecting from the ground. In doing this, care must be taken to prevent damaging threads. The best procedure is as follows: the length of pipe to be put on is carried in an approximately horizontal position and the end to be screwed on is laid half way across the top of the projecting pipe, so that when the new length is uprighted, it stands on the edges but does not slip on to the pipe in the ground. The new length is then lifted and carefully slipped over the threads of the pipe in the ground, and rotated to the left until it drops the width of a thread. Then it is turned to the right and screwed up by hand until it almost shoulders. If these precautions are not taken, and, instead, the new pipe is slipped over the projecting threads and then uprighted, there is a likelihood of the threads being damaged by burring, and time lost in repairing them. The pipe-head is then put on and screwed up by hand, the platform lifted into place, the horse-power attached, and all the four men mount the platform. The horse is then immediately started so that all new joints will be set up. Assume that ordinary drilling has been resumed and that the pipe does not sink, the core having been drilled out. There is then danger of drilling below the pipe and thereby getting a false sample. In such case the pipe must be driven as described earlier in this paper. It is usual to drive one foot at a time.

Drilling in Sandy Ground.—Suppose that a sand stratum is reached and the drilling-pump is not making its customary progress. The helical-pocket-pump is then substituted. This pump is just like the drilling-pump except that it has a helical bit designed to bore into sand. The operation is as follows: The tool, having been lowered until it rests on the core, is then rotated from 180 to 360°, the string of tools is lifted 2 to 2½ ft. and dropped. This series of operations is repeated several times. The sand is thus picked up by the helical bit, as it is rotated, and forced into the pump as it drops and held there by the ball-valve. The further manipulations are the same as in the case of the plain drilling-pump.

Drilling in Clay.—Suppose that immediately under this sand clay is encountered which does not discharge freely from the drilling-pump. The small auger-drill-spoon is lowered into the pipe and worked exactly like a post-hole auger. Clay can be penetrated with this tool at a very rapid rate, and decomposed bedrock has been bored with it at the rate

of over 10 ft. per hour. In this hypothetical hole, suppose the downward course of the pipe has been stopped and driving does not serve to sink it. This may be caused either by a boulder, buried timber, cemented or frozen ground. In the first three cases, progress is made by using the rock-bit, an ordinary fluted drilling bit, the length of which is the same as that of the other tools. Therefore the graduations will show the position of the tool with relation to the bottom of the pipe. Churn-drilling is done as usual, and unless the boulder is large and hard it can be broken so that the pipe can be driven through it. This is the time when drilling below the pipe is necessary and permissible. As a matter of fact, many holes can be sunk in rocky ground without encountering any boulders that need this treatment.

Emptying the Drilling Pump.

When a boulder is so large that it cannot be penetrated by driving, or by drilling and driving, it is necessary either to abandon the hole and start a new one near it or to pull the pipe a foot or two to prevent damaging it and to blast the boulder with half a stick of No. 2 dynamite. Blasting in this way shatters the sides of the hole and shakes in material not belonging to the sample. When the pipe has again been sunk to the depth from which it was pulled, the content of the pipe must be pumped and allowance made for any excess of gold contained therein. It is usually better and quicker to abandon the hole and start a new one near it unless the hole is deep. A buried timber, if in a good state of preservation, is very hard to penetrate with the pipe or by drilling; while it is not impossible to drill through it, it is usually impossible to cut a hole of sufficient diameter to get the pipe through. Here, as before, it is usually better to abandon the hole and start a new one near it. If the timber is not in a good state of preservation, it gives no trouble. If the obstacle is frozen ground, plenty of hot water, heated in a tank furnished for this purpose, is frequently poured into the pipe. This, of course, thaws it and is of considerable assistance, but it is advantageous to also drive the pipe, for more rapid progress can thus be made. It is sometimes advisable to drill a little below the pipe, for in frozen ground the sides do not cave. Thus about 2 ft. per hour can be made. When tightly cemented gravel retards progress, it is necessary to use the drilling-bit and to drive the pipe frequently. Cemented gravel can be easily recognized from the cemented pieces brought up by the pump.

Drilling in Running Ground.—Sometimes loose sandy ground, with a large content of water, is struck. Usually the pipe sinks very rapidly through this and no trouble ensues unless the water-level in the pipe is considerably lower than the ground-water level. In this case water flows into the pipe and carries running ground with it. Such a circumstance is noted by the occurrence of an excessive core. It is then best to drive the pipe until solid material is reached. An allowance must be made for this excess of core. It is always best to rotate the pipe when driving it, for it makes driving easier.

Stuck Tools.—It sometimes happens that through carelessness the drilling-pump, after having been churned for some time, is allowed to rest on the core in the bottom of the hole and the agitated material settles around it and holds it fast. It is often possible to release the pump by turning the string of tools and lifting at the same time. When this fails it is necessary to uncouple the rod at which every joint breaks and to lift out those rods which are above the broken joint. When lifting a string of tools from the hole, it saves time to uncouple the rods in 10-ft. lengths. The pump-jar device is attached to those drill-rods which have been lifted out and then lowered into the pipe until it rests on the uppermost coupling left in the pipe. On the lower end of these jars there is a funnel-shaped steel shell, the largest diameter of which is slightly smaller than the inside diameter of the pipe. This guides the two couplings together and the joint is easily made. These jars are similar in construction and action to the jars of ordinary drilling rigs. The stuck pump is soon jarred loose. If any other tool becomes stuck in the pipe, as seldom happens, the same procedure is followed.

Recovering Lost Tools.—Inexperienced drilling crews are apt to drop a tool or the string of tools into the pipe. In such an event a sufficient length of rods is lowered into the pipe, and a connection is easily made because of the taper thread couplings, and the lost parts so recovered. If for any reason anything that cannot be recovered as above described, should be dropped into the pipe, it is necessary to drive the pipe until a large core is secured. It is then best to pump the water out of the pipe, so that its extra weight will be removed and not tend

to force out the core or plug as the pipe is pulled to recover what is lost in it. Care must also be taken in pulling the pipe, not to jar it, for this would also endanger losing the core or plug and the lost article held by it. When bedrock is reached the hole is continued until no more gold is recovered. It is then good practice, if the bedrock is coherent and not too hard, to drive the pipe hard into it until a considerable core is obtained or until it can be driven no farther. The water of the hole is then pumped out and the pipe pulled, the object being to get an unchanged sample of the bedrock, and it also insures properly getting every particle of gold of the sample.

Pulling the Pipe.—The horse-power is detached, the pipe-head loosened as explained above, the platform removed, and the pipe-head unscrewed. Immediately after removing the pipe-head, the gripping device is slipped over the pipe and allowed to rest on the ground. This device does not retard the upward motion of the pipe, but it grips it automatically, should it start downward. This device is simply two bars of steel slightly bent and sharpened on one end like a cold chisel, fastened together in such a way that the convex sides of the bars are always down. The pulling-cap is screwed onto the pipe, the pulling-stand placed within 18 in. of the pipe, the pulling-lever inserted in the yoke of the pulling-cap and rested on the fulcrum, placed at a convenient height, and the turning-bars inserted in the rings of the pulling-cap. Several of the men bear down on the power end of the pulling-lever, while others rotate the pipe as is done in sinking it. In this system of drilling the pipe is both sunk into and withdrawn from the ground largely by the aid of rotation. Inasmuch as a lever 25 ft. long or more can be used having a ratio of power-arm to weight-arm as 24:1, each 100 lb. of weight on the power end exerts a lifting force of more than a ton; the pipe can be pulled at the rate of 60 ft. per hour. The tools that do this work so effectively must be described. The pulling-cap is a device made of two pieces, the lower piece is screwed to the pipe and has two rings, one on each side, large enough to receive two sticks of 4 in. diam. The other part is a yoke, swiveled to the lower part. This yoke, 10 in. diam., receives the weight-arm of the pulling-lever. The pulling-stand is a fulcrum made of channel-iron thoroughly bolted and braced. Holes about 1.5 in. diam. are spaced about 5 in. centres for the full length of the uprights, about 6 ft. Into these holes a pin, grooved circumferentially at each end, fits loosely; when in place the sides of the grooves straddle the webs of the channels and serve to stiffen the pulling-stand by tying the two uprights together when the pulling force is exerted. As the pipe is pulled from the ground, the pin of the pulling-stand is raised from hole to hole until the top hole is reached. There is then about 5.5 ft. of pipe projecting from the ground, with ample room to put on the chain-tongs, of which two pairs are used, one of which is placed on the upper section of the pipe, the pulling-lever is removed from the yoke of the pulling-cap, and the pulling-cap unscrewed and removed. The upper length of pipe is unscrewed and carefully taken off and for this purpose the following manipulation has been found to be the best. A crowbar is driven into the ground alongside the lower chain-tongs handle. A piece of 1½-in. pipe 6 ft. long is slipped over the handle of the other chain-tongs. One man holds the crowbar, while several others strain against the pipe-handle on the other tongs, one man, meanwhile, tapping the joint with a hammer. This is sufficient to break the joint, although it is often necessary to use considerable force, for the pipe-joints may have been set up very tight by the horse pulling hard on the end of the sweep, which action is like that of a 12-ft. wrench. After the first length of pipe has been pulled, it is usually much easier to pull the rest and it is faster to use the pulling-chain slung over the end of the lever and around the pipe, instead of the pulling-cap. When this is done, the pin in the pulling-stand is placed at a convenient height and left there. When the pipe is pulled until the power-arm touches the ground, the lever is raised and the chain slips down to a new position, automatically gripping the pipe as the pulling lever is again brought into action. This manipulation is repeated until all the pipe has been pulled from the ground and disconnected.

Moving to and Starting New Hole.—Usually when there are less than four lengths of pipe remaining to be pulled, part of the crew can be spared to commence moving the tools and pipe lengths to the new hole and arranging them, as explained above. The move may be a short one, in which case it is often advisable to start two men boring with the drill-auger-spoon, so the new hole will be far enough along to receive the first section of pipe as soon as it is brought from the last hole. This completes the description of the drilling of the hole and pulling the pipe. This operation is repeated whenever a hole is to be sunk.

Labor.—It requires four men to do the actual drilling and a fifth laborer, either man or boy, to hand up and take down tools to and from the men on the platform, as required, to empty the pumps, and to act as a roustabout. All of the above are unskilled laborers. The man in charge of the operation, who also does the panning, should be experienced. One horse is needed to rotate the pipe. As this work is not hard, an animal weighing 600 to 800 lb. is usually fully strong enough. Sometimes where it is not possible to get an animal to rotate the casing, one to four men are used; these men use bars as when rotating a capstan, and these bars can be of such lengths as the difficulty of rotating requires.

Care and Repair of Tools.—All threads must be kept clean and lubricated with an oil and graphite paste and all tools should be kept off the ground and sufficient care exercised in handling them so the threads will not be battered. In case threads are damaged, they can be easily repaired by using either a sharp cold-chisel or a three-cornered file. There is very little wear and tear and the parts that do wear, namely, the cutting shoe and circular drilling pump bits, are easily renewed. The fluted drilling-bit is used so little that it is seldom necessary to sharpen it. An Empire drill has been used for months where

there was no blacksmith outfit and sharpening was done on a grindstone. As wear and tear is very slight, depreciation is very slow, and as breakages are infrequent there is practically no time lost.

Transport.—The drill can be transported anywhere that men can walk, and also in small canoes, as it knocks down into small pieces.

Rate of Drilling.—Drilling can be done, under average conditions and where the ground is 30 to 50 ft. deep, at the rate of 30 to 50 ft. per day; when ground is shallower, a still faster rate can be maintained; when it is deeper, progress is slower. The drill as described above has been used to a depth of 110 feet.

Deep-Drilling Apparatus.—It is claimed that with a deep-drilling apparatus, holes 200 ft. or more deep can be drilled. This apparatus is attached to the platform and consists in a hand device to act as a spring pole. A small wire rope is substituted for rods, only enough rods being left on the tool to give weight.

Cost of Drilling.—With labor at $1 per day and a horse at $1 per day, and ground from 30 to 50 ft. deep, the actual drilling costs 12 to 20c. per foot. In frozen ground 25 ft. deep, 2 ft. per hour can be averaged, and recent work in Siberia has shown that this has been done there with an inexperienced crew for 23c. per foot. In Idaho, with 6 ft. of snow on the ground, and half the time spent in shoveling snow away from the drilling places, the thermometer at times 25°F. below zero, and labor at $3.50 per shift, drilling was done at the rate of 37½ ft. per day of 8 hours and at a cost of 65c. per foot. At another place in Idaho, ground 15 ft. deep, labor $2.50 per day, with four men and one horse, an average of 42 ft. per day was made at a cost of less than 27c. per foot. In South America, ground 19 ft. deep, labor 50c. per 9-hour day, and eight men, an average of 22 ft. per day at a cost less than 19c. per foot was obtained. In Siberia, with 30-ft. ground, in parts frozen, labor 75c. per 10-hour day, with nine men and a horse, the average rate per day was 32.5 ft. and the cost 25c. per foot. In Colorado, ground 18 ft. deep, labor $2 per 10-hour day, with five men and a horse, an average of 51 ft. per day at a cost of 25c. per foot has been noted. It must be remembered that in each case a green crew had to be broken in and that for the first few days progress was much below the average given. On long jobs the average rate would be greater and the cost less.

Pulling the Pipe.

Precautions.—The drilling-pump must not be allowed to rest on the core after it has been churned up and down, as there is danger of its sticking as described above. There is no danger of the pump sticking if it is allowed to rest on the core immediately after lowering into the pipe. Plenty of water should be used, and it is better to have the water-level in the pipe higher than that of the ground water, to prevent the running in of ground when loose water-bearing sand is struck. If the water-level is allowed to get too low, the ball-valve will not seat tight, and the sample will be lost from the pump as it is being raised to the top of the pipe. As an indication of insufficient water in the pipe, it will be observed that mud splashes up onto the rod. In making joints, care must be taken to have the rod-joints set-up tight, otherwise they may work loose and endanger the threads. In setting-up tight, it is only necessary to jerk the rod-wrench once, as the play between the rod and the wrenches and between the straddling wrench and the hole has the effect of a quick sharp blow. A single jerk is also all that is necessary to break the joint. Care must be taken never to drive pipe until all pipe joints are shouldered. It is generally bad practice to drill below the bottom pipe, although it is sometimes permissible in breaking through a large boulder or in drilling frozen or cemented ground. Great care must be taken to have the hole started vertical. If after the first or second length of pipe is in the ground, it is seen that it is not plumb, a wedge driven in between the pipe and the ground on the side toward which the pipe leans, will often force the pipe over far enough to make it plumb. In case this does not result in plumbing, it is better to pull the pipe until it can be wedged to a vertical position and then drive it to the depth from which it was pulled. The extra core obtained in this way must be discarded. In carrying the pumps from the hole to the dump-box and dumping therein, care must be taken that nothing slops over the top of the pump or splashes out of the box. It is a good plan to mark the pipe every foot with chalk. This makes it easy to keep track of the depth of hole.

The nitrate industry of Chile made good progress during 1910, notwithstanding the low prices prevailing for nitrate. A number of new nitrate works have been opened, and most of the well-equipped plants were run at full capacity, and seemingly at a good profit. During the first nine months of 1910, 3,942,648 tons of nitrate was produced in Chile, against 3,200,039 tons for a like period in 1909, and 3,092,506 tons exported, against 2,847,564 tons for the same time in 1909. The world consumption was 4,399,698 tons for the first nine months of 1910, against 3,612,020 tons during a like period in 1909.

Improvements in Silver-Lead and Copper Smelting—II

By L. S. Austin

***Sampling Anode Copper.**—William Wraith has presented the result of an investigation made at the Washoe plant of the Anaconda Copper Mining Co. to determine reliable methods for sampling anode copper with special reference to its silver content. The blister copper from the converters is poled in the refining furnace before casting into anodes. During the four-hour casting period four samples are taken at regular intervals which show that the charge is uniform in silver, an average result of several lots being 74.04, 73.99, 74.10, and 74.20 oz. per ton. Three methods of sampling were investigated, of which the first two, described below, proved reliable: (1) *Shot-Sample Method.*—At hourly intervals a small portion of the molten stream, as it pours from the furnace, is 'shotted' into a bucket of water by batting or striking it with a wooden paddle. Each sample is dried, particles of burnt wood removed, and the sample screened on a 10-mesh screen. The oversize of this is screened on a 4-mesh screen to remove the coarse shot, the undersize between 4-mesh and 10-mesh being the sample. The four portions of the lot thus obtained are cut to one-half by being passed over a 16-slot splitter having slots ½ in. wide. (2) *Drilling-Sample Method.*—Every fourth anode of a lot is drilled, using a 99-hole template (11 rows of 9 holes each). The holes are used in continuous order, one hole to the anode. For example, if in lot 890, holes No. 1 to 90 were used, then in lot No. 891 the sampling would begin with hole No. 91. The anodes for sampling are carefully swept clean, then drilled with ½-in. drill from the bottom side upward, reserving the drillings. These drillings are ground to pass a 16-mesh screen, and the samples thoroughly mixed and quartered to 1 lb. in weight. The 1-lb. sample is passed over a 40-mesh screen and both oversizes weighed, the same ratio being maintained in the assay-ton used for assay. (3) *Ladle-Shot Method.*—A ladleful of copper was taken from the furnace-stream, then poured over a wooden paddle into water, thus making shot which were treated as in the first method. This proved to be unsatisfactory because of segregation of the silver during the time the molten metal was held in the ladle. An average of results obtained on 29 lots gave, by the shot-sample method, 72.69 oz., and by drilling-sample method 72.61 oz. Ag per ton. The ladle-shot method gives too high results.

Electrolytic Copper Refining.—G. H. Blakemore, who had been associated with the Lithgow refining plant, Australia, has given interesting details of his experience. The depositing tanks, of Oregon pine treated with paraffin, are 4 ft. 2¾ in. long to take nine anodes 28 in. wide by 26 in. deep. Two cathode sheets, each 13 in. wide by 27 in. deep, are hung opposite each anode, or 18 in all. The tanks are lined with sheet-lead, 6 lb. per square foot, which extends over the top edges. Insulation is secured by resting the tanks on paraffined hardwood joists, and these rest on six square glass insulators. These insulators again are supported by 6 paraffined wooden blocks carried on 6 brick piers. This construction permits ready access to all parts of the tank, so that leakage may be readily detected. The copper busbar conductors are insulated from the tanks, resting in glazed porcelain holders held in brackets on the outside walls of the tank. The tanks are arranged in rows of 3 tiers of 8 tanks each, the series-parallel system having been adopted. The electrolyte flows through the 8 tanks in series, thence by the sump launder to the collecting-tanks, from which it is elevated by compressed air to sand-filters. Those in turn deliver the electrolyte to feed-tanks which supply filtered solution at about 15 lb. per minute to each 8 tanks. The sand-filter removes the small quantity of slime which floats in the electrolyte and which would otherwise tend to deposit on the cathodes. Hard-lead pipe coils, carrying waste steam, are placed in the supply tanks by which the electrolyte is heated to 120° to 130° F. This not only diminishes the resistance of the liquid, but insures a more even deposition of the copper. The electrolyte at Lithgow is carried at 12% free acid and 14% bluestone ($CuSO_4 + 5H_2O$) with a specific gravity of 1.18. Low acid increases the resistance, and if it falls to 3½%, there results a deposition on the cathode of a mixture of metallic copper and cuprous oxide instead of copper alone, while the anode mud may go as much as 80% copper. Low acid and defective circulation of the electrolyte cause the formation of brittle cathodes of low conductivity.

Starting-sheets are prepared as follows: Rolled-copper sheets ⅛ in. thick are dipped into a tank of melted tallow, then set on edge for the surplus tallow to drain off. When the tallow is set the plates are coated with graphite by moving them about in a shallow box containing finely-ground graphite. To prevent the copper adhering to the edges of the plates, these edges are dipped in a tank filled ½ in. deep with molten tallow; the copper deposits on the graphite surfaces only. Twenty-four of these plates are hung in a vat with 12 anodes and get coated with a thin sheet weighing 2 to 3 lb. The electrolyte is warm and actively circulated. There is a loss of 10% in making, and the sheets are generally quite tough. They are suspended by hooks or, better, by two loops of copper riveted to the sheet. Figuring the usual sheets at 90% of those set, with the cathodes in the 672 tanks charged every 14 days, the sheets required daily will be 960, and the output of the refinery, in theory, 157 tons weekly, or actually 150 tons per week. The quantity of copper as copper sulphate in the electrolyte tends to increase, and this, when over 14%, must be removed from time to time. For this purpose 12 tanks are provided with insoluble lead anodes, and through them a portion of the electrolyte constantly flows. In starting fresh sheets, the speed of the generator supplying current to these tanks must be carefully regulated: if run too fast, the current will buckle

*Continued from *Mining and Scientific Press*, p. 63.

the lead anodes and so cause a short circuit. The generator may run 24 hours before the ammeter will register, and until it shows about 250 amperes it is wise not to speed up too much; this taking about two days.

The anode-mud is taken from the tanks at regular intervals, being run straight to a sump where the mud is settled and the clear supernatant solution decanted. The residue is bailed into a lead-lined box on wheels, and taken to the refining-room. Here, to remove the scrap or coarse particles of copper which have fallen from the anodes, it is poured through a copper sieve into storage-tanks. The scrap remaining on the sieve is well washed, then cast into anodes for re-treatment. The percentage of scrap made at the Lithgow works is 8.5 to 9.5%; in the United States it amounts to 10 to 15%, because here all the anodes are removed at one time. The mud, washed to free it from copper sulphate, is slowly dried in steel trays, then heated to a dull red to get rid of tallow and to alter the condition of the graphite which had coated the starting-sheets. Before this practice was followed it was not possible to remove all the copper even with prolonged treatment with acid. About 400 lb. of the mud, containing 24 to 28% copper, is now boiled with 300 lb. concentrated H_2SO_4 in a cast-iron pan with a hood to remove the acid fumes. In about four hours all but about 0.3% has been extracted. The residue is washed, dried, and melted with bicarbonate of soda in a cupel-furnace to doré bullion, this bullion assaying 120 to 160 fine in gold and 820 to 860 fine in silver. No attempt was made to save the selenium, though at one time a selenium matte was produced when smelting the slime in the cupeling furnace. This matte carried about 50% copper and 10 to 14% selenium.

Silver-Lead Blast-Furnace Smelting with Charges High in Lead.—At Trail, B. C., and at the East Helena plant of the A. S. & R. Co. the charge contains 35% lead and over. At the latter plant in particular this imposes unusual conditions and difficulties. First, in order to avoid the making of excessive quantities of matte, some 95% of the ore must be roasted down to 3½ to 4% sulphur. The ore itself contains zinc so that the slag must be high in iron. Thus there is a slag of high specific gravity, while the matte, since it carries zinc as sulphide, is lighter than usual. There results peculiar difficulty in making a ready separation of the two. The slag is tapped to a rectangular fore-hearth which is changed every second day. The matte is tapped from this fore-hearth into a Kilker matte-casting machine. The slag is taken from the fore-hearth into large electrically-moved slag-pots, run to the dump, the slag-pots moved over on their frames, and the slag dumped well outside the rail. The slag-shells are saved and re-melted.

Blast-Roasting.—Blast-roasting at present is chiefly practised by the use of large pots with an upward blast of air. Because of the large body of ore, an even roast can not be expected on all portions of the charge treated; for while some parts are subjected to a heat so high as to fuse the ore and thus stop further elimination of sulphur, other parts are but little burned and remain pulverulent. It has been for this reason that machines of the Dwight-Lloyd type have been devised, where the layer of ore is thin (4 or 5 in. thick), where the ore can be continuously fired, and where a bed of uniform nature may be prepared for burning. The mechanical difficulty of roasting on such a bed has been that the ore sticks to it, a difficulty overcome by Greenawalt through the use of a layer of crushed limestone spread upon the grated pallet or bed which carries the charge. H. O. Hofman has recently published a paper, being a review of the progress of blast-roasting to date, and in particular has described the most successful of the Dwight-Lloyd machines of the endless-chain type. F. M. Smith has described the machine as used at East Helena, Montana. It is 28 ft. long over all and has an effective area of the size of the air-tight suction-box below, 2½ ft. wide by 12½ ft. long. A series of perforated pallets propelled by endless-chain and sprocket-wheels is carried over this box, and air is drawn downward through the ore. The ore is moistened and fed upon the pallets from a hopper and set on fire as it comes to the suction-box, either by a transverse trough containing a coal fire, or by a transverse pipe carrying burners supplied by gasoline under pressure. The pallets travel at the rate of 10 in. per minute, and by the time they have traversed the wind-box, roasting has been completed. As the pallet rounds the end-wheel, it slides a foot or so on the endless-chain, and with a jar brings up against the next pallet. The cake falls from it into a car set below. The ore must be of uniform texture and crushed to ¼-in. size as it is fed on the pallets, since if one part is more open or granular, then the air draws through freely, while the denser part gets insufficient air. A separate hopper delivers the ½-in. layer of crushed limestone to the pallet just before the ore is fed. The machine has a capacity of 40 tons daily. Two larger machines are being erected at the East Helena plant with a wind-box of 3½ ft. wide by 24 ft. long and a calculated capacity of 100 tons each daily. These two machines take up no more space than a single reverberatory roaster and are expected to turn out 14 times as much product.

I may add that at this works, besides the Dwight-Lloyd sintering machine, there are 12 Huntington & Heberlein pots in continuous operation. A well-sintered product is obtained.

John E. Greenawalt, of Denver, who has the basic patent for the grated bed and its non-adherent layer of limestone or other infusible material through which a down-draft of air is drawn, has been conducting experiments looking to the use of a series of trays successively charged and discharged by hand. He has been able to get satisfactory results using a bed at least 12 in. in thickness. The top of the ore contained in this tray he uniformly ignites by covering with a hood into which he momentarily injects coal-oil under 80-lb. pressure by means of 6 jets, 3 on a side, and sets fire to the entire surface of a tray of 6 by 8 ft. The ore-charge is made up

preferably to 17% sulphur, and may run to 22% and still not melt together. If too high in sulphur, too great heat causes premature fusion and the stoppage of further desulphurization. Since the rate of burning the sulphur depends on the rate at which air is drawn through the charge, the lower sulphur charges are most rapidly roasted. In the H. & H. or pot-roasting methods, the ore gets a preliminary roast down to 13% sulphur. This roasting is not needed for the down-draft processes. The product is in satisfactory sintered condition and the sulphur elimination has been much better than with the H. & H. process.

Arsenic as a By-Product in Smelting.—Where the bag-house is used in silver-lead smelting or in converting leady copper mattes, not only is the lead fume condensed and caught, but arsenic accompanies it. On account of its detrimental effect, it has been sought to remove this and sell the by-product thus obtained. Arsenic is now quoted at 2¾c. per pound, a figure too low to permit of extraction with profit. However, the smelting plants still continue to recover it for legal reasons. Where it is found in quantity in bag-house fume, this fume is roasted and a resultant product, high in arsenic, is caught in one chamber of the bag-house. This product is again roasted to obtain a commercial product. At copper plants the procedure is a little different. The flue-dust in the portion of the flue nearest to the stack contains the largest portion of arsenic. This dust is treated in a Brunton revolving roasting-furnace which gives a crude arsenic product, while the residue, thus freed from the metal, is sent to the reverberatory-furnace for smelting. The crude arsenic is again re-roasted and the pure crystals, resulting from the condensation of the vapors arising from the roasting, form in the flue specially built for such recovery.

Treatment-Costs may be summarized as follows:

	Per ton.
Reverberatory smelting, Utah Con	$ 1.40
Blast-furnace smelting, Tennessee Copper Co., coke costing $4.30 per ton, and including the cost of about 20% barren quartz for fluxing	0.96
Granby Con., blast-furnace smelting, coke costing $5.75 per ton	1.20
Cost of converting about 40% Cu matte in an acid-lined converter may be given at...	8.43

The same cost for a basic-lined converter was $7.76.

Converting, refining, and smelting-costs per ton from Western points may be taken as follows:

	Per ton.
Converting, including cost of bag-house and re-treatment of converter by-products	$ 8.43
Freight, $10; refining, $3; profit in refining, $6; selling, $6; general expense and administration, $2	32.00
Total	$40.43

This equals close to 2c. per pound of copper produced.

The Southern States from North Carolina to Georgia have all produced gold. North Carolina is said to have produced about $20,000,000.

MINING IN MOTHER LODE

Deep mining in the Mother Lode counties of California is being successfully carried on more and more vigorously and the resultant yield is increasing. The number of productive mines in these counties is comparatively small, owing to the large investments required, but their yield is great, especially where extreme depth has been attained and reduction works of suitable proportion have been installed. The average grade of ore in these mines is comparatively low, but very large quantities of ore are mined and milled. The largest quantity of ore in the Mother Lode counties is mined in Calaveras county, but the largest output of gold is from Amador county. In gold output Tuolumne county comes third, followed in order by Mariposa and Eldorado counties. These five counties produced in 1910 over 1,400,000 tons of ore from which was obtained nearly $5,000,000 in gold. On comparing these figures with those for several preceding years it is found that both tonnage and gross yield show a material increase in 1910 in these counties. In Amador county one mine has sunk a shaft to a vertical depth of 3550 ft., and the vein at the deepest level—the 3450-ft.—is of the same character as it was near the surface and equally profitable.

Zinc ore imports in 1910, according to C. E. Siebenthal of the U. S. Geological Survey, were approximately 85,084 short tons, containing about 83,000,000 lb. of zinc and worth, as invoiced, about $888,000; 116,269 tons of zinc ore was imported in 1909. The figures for 1910 do not include 10,431 short tons of lead ore from South America, containing 2,645,111 lb. of zinc, an average of less than 13%, all of which was lost in smelting the lead and thus does not properly enter into the figures of imports of zinc. Of the zinc ore imported, 80,309 tons, or 90%, came from Mexico, as compared with 106,245 tons imported from Mexico in 1909. The exports of zinc ore for the first eleven months of 1910 were 17,558 short tons, valued at $570,510, as compared with 12,455 tons in 1909. Imports of spelter were decreased over half, being estimated at 3339 short tons, valued at $282,653, as compared with 9670 tons in 1909. Exports of domestic spelter increased over 50%, being estimated at 3953 short tons, valued at $424,172, as compared with 2566 tons in 1909. The establishment of zinc smelting in bond increased the exports of foreign zinc from their previously insignificant proportions to approximately 5029 short tons, valued at $196,250, in 1910. During the first nine months of the year there were also exported, under drawback, articles manufactured from 2717 tons of foreign spelter on which duty had been paid. The exports of zinc dross amounted to 4675 short tons, valued at $377,000, as compared with 7069 tons in 1909.

Deep buried rivers, covered by débris of any kind, including lava caps, hundreds of feet in thickness, may be located as placer if on the unoccupied lands of the United States.

Recent Cyanide Practice at the Montezuma, Costa Rica

By S. F. Shaw

The Montezuma Mines of Costa Rica are situated about 15 miles from Punta Arenas, a seaport on the western coast of Costa Rica. The veins are supposed to have been worked to some extent in early days, but the earliest authentic records of work go back to only 1899 at which time two 20-stamp amalgamation mills were erected and operated. A low recovery of gold and silver was obtained, probably between 50 and 75%, as part of the gold was enclosed in the sulphides in the ore. In 1901 experiments were made with cyaniding, but along unpractical lines. In 1906 the consolidated Bella Vista and Thayer mining properties erected a 40-stamp mill which began operations in 1907, employing plate amalgamation, followed by leaching of the sands. In 1907 and 1908 earth slides and freshets carried away the slime plant then in process of erection, owing to the temporary character of the construction, which necessitated re-building. Advantage was taken at this time to introduce the latest practice in the treatment, wherein agitation in Brown tanks and filtration with Butters filters would be employed. The ore as it comes from the mine in 1-ton side-dumping cars is weighed on a 10-ton Fairbanks scale, then trammed to the mill and dumped onto a grizzly floor of 16½ by 66 ft. with bars spaced 2 in. apart. Owing to lack of head room, it became necessary to use a flat floor and to scrape the ore over the grizzly openings. The bin is 66 ft. long by 14½ ft. wide and 23 ft. deep at the lowest point; 8300 cu. ft. of space is available for the fine that has passed through the grizzly. Two 7 by 10-in. Blake crushers take the oversize, crushing same to 1 or 2 inches. Eight Challenge feeders supply the batteries with ore. The lime, amounting to 6½ lb. per ton of ore, is added to the ore as it enters the feeders. The stamps weigh 1050 lb. and drop 6 in. 96 times per minute. The screens are slotted, equivalent to 12-mesh, and last about 120 days. Double-crimped brass screen, 20-mesh, is also used at such times as the tube-mills are not in use, and last about 10 days. Crushing is done in 0.10% cyanide solution, the proportion of solution to ore being about 8:1. The percentage of material from the 8-mesh screens passing through various-sized screens is as follows:

Mesh.	Per cent.	Mesh.	Per cent.
20	26	100	6
30	13	120	2
40	6	150	1
60	16	200	4
80	6	—200	20

The pulp from the batteries flows through eight 3-in. pipes to two 60° conical settlers provided with Caldecott diaphragms, which deliver a product to the Abbé tube-mills containing 26% moisture, and sizing as follows:

Mesh.	Per cent.	Mesh.	Per cent.
40	42	120	3
60	22	150	3
80	13	200	3
100	10	—200	4

These tube-mills are 20 ft. long by 4½ ft. diam. The silex lining lasts about 10 months, and Danish pebbles are used as a grinding medium, the consumption being about 1½ lb. per ton of ore. The tube-mills are provided with a spiral feed which occasionally gives trouble by clogging, also by throwing out sand from time to time. The discharge from the mills contains 34% moisture, the amount above that in the feed being added, as pulp with only 26% moisture is too thick to discharge.

Cyanidation Plant.

Montezuma Mines.

The sizing test of the discharge is as follows:

Mesh.	Per cent.	Mesh.	Per cent.
60	3	150	6
80	7	200	15
100	18	—200	46
120	5		

The discharge from the tube-mills joins the overflow from the settlers and runs two 50-in. conical settlers through two 4-in. pipes, the underflow being returned to the tube-mills by a 6-in. Price centrifugal pump driven by an 18-in. Pelton wheel operating under a head of 470 ft. A Dorr classifier was erected to take part of the flow to these 50-in. settlers with the intention of leaching part of the sands. As it was found that the slime plant could handle all the ore that was delivered to it, the Dorr classifier was not used. For treating these sands, there are 4 tanks 28 ft. 8 in. diam. by 5 ft. deep. The overflow from the two 50-in. conical settlers and the Dorr classifier

flows through a 4-in. pipe to a cone-settler 25 ft. diam. and 25 ft. deep, having a slope of 60° and containing 5500 cu. ft. The upper 4 ft. of the settler is cylindrical. The sizing test of the pulp at this point is as follows:

Mesh.	Per cent.	Mesh.	Per cent.
60	1	150	4
80	7	200	10
100	12	—200	58
120	8		

The overflow from this settler goes to a tank 29 by 8 ft. containing 5550 cu. ft. This tank also receives the solution drawn from the sand-leaching tanks. When the settler is full, it is discharged into one of two Brown agitation tanks 15 ft. diam. by 45 ft. deep, having a conical bottom with a slope of 60°, and holding 6038 cu. ft. This pulp averages about 66% moisture. Agitation is given for 12 hr. in 0.10% cyanide solution and pulp is then drawn through an 8-in. pipe by a Butters 8-in. centrifugal pump and delivered to a cone-reservoir containing 5500 cu. ft., of the same dimensions as the first settler which discharges into the Brown tanks. The pulp is here kept in continuous agitation with air at 25-lb. pressure until all is drawn into the filter. Filtering is done in a 60-leaf Butters vacuum-filter contained in a steel box having hoppers with 60° bottom slopes. Three 3-in. overflow pipes carry off the surplus pulp, while a 6-in. Price centrifugal pump continuously delivers pulp to the filter during the time the cake is being formed, through a 4-in. pipe at the top and on the side of the filter-box, and distributed into the box by sixteen 1-in. pipes placed over the leaves, being spaced so as not to interfere with taking out the leaves. After a cake, averaging 1¼ in. thick, is formed, the pulp is discharged to two tanks 14½ by 6 ft. containing 990 cu. ft. each, from which it is returned to the conical reservoir; and when making a cake is also distributed over the filter, by the 6-in. Price centrifugal pump previously mentioned. The weight of dry pulp in a cake on each leaf averages 550 lb. Wash solution is admitted through the cake for 45 minutes, after which the box is filled with water and washed for 5 minutes; then the cake is discharged by allowing water under 40-ft. head to enter the interior of the leaf. The vacuum is maintained by a 14 by 14-in. Gould vacuum-pump running at 35 r.p.m. and driven by a 6-ft. Hug water-wheel operating under a head of 550 ft. The Butters pump is driven by a duplex Pelton water-wheel. The cycle of operations averages as follows:

	Min.
Filling with pulp	8
Making cake	60
Returning excess pulp	8
Filling with wash solution	8
Washing	45
Returning wash solution	8
Filling with water	7
Wash with water	5
Discharging cake	8
Total	157

The discharged cake contains about 30% moisture. Thirty tons of strong solution is drawn through the leaves per cake, and 18 tons of wash-solution, averaging 1.2 tons of wash-solution per ton of dry pulp. The filter-leaves are washed in an acid tank accommodating 3 leaves which is operated automatically, drawing the acid through the leaf and then forcing it out again, 0.2% hydrochloric acid solution being used for this purpose. The strong pregnant solution from the filter flows to a strong-solution gold-tank 39 by 7½ ft., containing 8960 cu. ft. This tank also receives the solution from the 29 by 8-ft. overflow tank. The weak solution is pumped to a weak-solution gold-tank 20 by 6 ft., containing 1885 cu. ft. The strong solution is drawn through 6 rows of zinc-boxes, 6 compartments in a row, each compartment being 24 by 24 by 24 in. and containing 5 cu. ft. of zinc-shaving. The weak solution flows through 3 rows of zinc-boxes, 5 in a row, having compartments of the same dimensions as the strong boxes. The strong solution, before passing through the zinc-boxes, averages $3.40 per ton, and after being precipitated averages $0.49 per ton, thus securing an extraction of 86%. No effort is made to obtain a thorough precipitation. The amount of zinc consumed is 0.85 lb. per ton of ore. The strong solution flows to a sump 35 ft. 3 in. by 7½ ft. containing 7450 cu. ft., from which it is pumped by an 8 by 8-in. Gould triplex pump driven by a 7-ft. Pelton water-wheel through a 3-in. pipe-line to the battery storage-tank, 29 ft. 4 in. by 13 ft. 8 in., containing 9215 cu. ft. The weak solution is pumped from the weak-solution sump containing 380 cu. ft. to the weak-solution storage-tank, 35 by 7½ ft., containing 7215 cu. ft., by a Price 3-in. centrifugal pump.

Air is compressed by a Rand duplex 10 by 16-in. compressor, which is relieved when making repairs by a 16 by 10-in. Clayton air-compressor. The electric lighting system is supplied with current by a 75-kw., 300-amp., 250-volt General Electric dynamo, running at 550 r.p.m. The two compressors, triplex pump, and 3-in. centrifugal pump are driven by a 7-ft. Pelton water-wheel operating under a head of 550 ft. The precipitate is drawn from the zinc-boxes to a tank 4 ft. 8 in. by 3 ft. 6 in. having a canvas filter-bottom. A vacuum is maintained under the filter, obtaining a product containing from 30 to 60% moisture.

Supplies for November were as follows:

	Pounds.
Cyanide	4.34
Zinc	0.84
Lime	6.43
Pebbles and lining	2.31

The costs for November were as follows:

Labor:	Crushing	$0.18
	Fine grinding	0.06
	Classifying	0.02
	Agitation	0.03
	Filtering	0.06
	Precipitating	0.04
	Miscellaneous	0.04
		$0.43
Supplies		1.22
Power		0.07
Assaying		0.04
General, office, etc.		0.09
Total		$1.85

Transvaal Stope-Drill Contest

The final report of the Transvaal Stope-Drill Competition has appeared. The four surviving drills made the following records:

	Footage drilled.	Inches per minute per machine over total time.	Cost in pence per foot drilled.
Holman, 2⅛	12,799	0.742	9.77
Siskol	14,083	0.818	9.90
Holman, 2¾	11,744	0.682	10.91
Chersen	11,781	0.684	11.94

The prize money was divided between the two first-named drills owing to the fact that taking everything into consideration there was little difference between the two machines. With regard to the individual drills, the committee reports that the Siskol was convenient in size, drilled fast, and was very economical. Its long stroke and feed were an advantage, while the ease with which it could be handled made it popular. Its cradle was faulty and lacked arrangement for adjustment after wear in the slides or feed-screw nut. The Holman 2⅛-in. drill was, if anything, too small; nevertheless, its maintenance costs were lower than any of the other competitors; it drilled well and was handled with ease. The Holman 2¾-in. drill and the Chersen were both handicapped by the travel of the valves being too small, which gave considerable trouble through frequent choking with dirt. The New Century 0.0. machine was too small and weak. The feed-screw and cradle were too short. In drilling a 4-ft. hole, as many as 5 drills were necessary. The committee arrived at the following general deductions as a result of the competition: (1) that hammer-drills were not suitable for the general stoping conditions prevailing on the Rand; (2) that hollow steel cannot be recommended, owing to its high cost and difficulty in tempering; (3) no new type of 'rig-up' gear submitted or used came up to the Holman type; (4) that any capable miner can efficiently supervise the working of more than two small machines; (5) that five native assistants are necessary to enable a miner to run two machines properly; (6) a good supply of drills should in all cases be easily available for the miners; (7) five natives being proved as necessary, the machines can be strengthened, as one weighing 125 lb. can under these circumstances be as easily handled as 100-lb. machines; (8) that under suitable conditions ground can be as cheaply broken with machines as with hammer boys; (9) that machines with long-stroke valve-gears are more efficient than those with short strokes, as they are less liable to get choked; (10) that machines with long piston-strokes proved themselves superior to those with a shorter stroke; (11) that provision of a feed of not less than 18 inches in length appears very desirable.

During the last twelve months many of the mines have been conducting experiments themselves with different stoping-drills, and of course have arrived at their own conclusions, which they are not likely to modify to accord with the results obtained by the Stope-Drill Competition, no matter how valuable from a competitive standpoint they may be. At the Robinson Deep mine, controlled by the Goldfields group, the supply of native labor has been anything but satisfactory, with the result that there was no alternative but to resort to the use of small drills in the stopes. Some careful experiments have been made at this mine with several makes of small stoping-drills, with the result that with small drills the cost comes out at 6s. per ton as against 5s. 11d. per ton by hammer boys. These results are interesting, and seem to show that it is possible that in the long run the mines, by a more extensive use of the stoping-drill where conditions are suitable, will be able to take a good deal of the sting out of the threatened scarcity of native labor.

MONAZITE

Monazite is a phosphate of cerium, lanthanum, praseodidymium, and neodidymium, containing silica and thoria. Its thoria content varies from 1 to 20%. Commercial monazite is recovered by mechanical and electro-magnetic processes from placer gravel and sand. In color, monazite varies from dull yellow to reddish brown, and has a resinous luster. Its specific gravity is 4.9 to 5.3, and it is readily recovered with other minerals by wet concentration. It occurs in a number of places in Idaho, notably on Grimes creek, in Boise basin, where it is found in old placer tailing, also close to bedrock in unworked placer ground, and in the adjacent granite benches. Some progress has been made here during the last year in working tailing and virgin ground for both gold and monazite. After screening and concentrating the tailing a concentrate is obtained which contains particles of magnetite, garnet, monazite, zircon, ilmenite, and a low percentage of silica. These elements are separated from each other by magnetic machines, the monazite thus obtained being nearly 90% pure, and containing about 5% thorium. In this stage of purity monazite is worth 12c. per pound. Thorium, which gives monazite its principal commercial value, is in demand for the manufacture of incandescent gas mantles.

A COPPER-ALUMINUM ALLOY

A new alloy, said to consist principally of copper and aluminum, is being placed on the market under the trade name of cupsor. In color it is like gold, polishes readily, and acquires a brilliant lustre, and is, therefore, adapted for jewelry and to all ornamental purposes. It is further claimed to be highly resistive to chemical influence. Not only is it said to be immune from the attack of the ordinary atmosphere, from salt water and salt air, but it is claimed that sulphuric acid, hydrochloric acid, lemon juice, tomato juice, vinegar, etc., have no effect on it. Cupsor can readily be machined and is easily rolled and drawn into wire. The tensile strength of cupsor in the casting is estimated to be at least 80,000 lb. to the square inch. The No. 20 gauge hard-drawn wire broke in a recent test at 138,550 lb. to the square inch. Its density is 8.11.

The Mining Industry in Korea

By T. Haga

In the mining industry, as in so many other fields of art and seienee, Japan and Korea have been in every way closely related. To go back in history to the reign of the Emperor Shomu (about 1200 years ago), the knowledge of this industry possessed by the Koreans far excelled that of the Japanese; but, while the latter, adopting the Korean art, made great progress in it, the former still remained in the primitive condition. However, after the Russo-Japanese war several legislative changes were made in Korea; and since the carrying out of the Mining Regulations in 1906, the industry has gradually been making progress, until at the end of last year it had an extraordinary development, the production for that year reaching 7,000,000 yen. Now that Korea is annexed to Japan her mining industry has come under the direct administration of Japan, and the future of the mining industry in Korea will doubtless attract the attention of the Japanese as well as foreigners.

Both vein and placer gold are among the mineral products of Korea; and there are many places well known as gold-producing districts. A book on Korea, compiled before the Russo-Japanese war, by the Russian administration of finance, mentions gold and iron ore as the principal minerals; and names a total of 98 gold mines, of which 17 are shown to be productive. According to the return at the end of last year, there are among the mine-lots, for which concessions have been granted, 117 gold mine-lots, 38 of gold and silver, and 136 of gold placer; but as the total number of mine-lots of all minerals is 565, those of gold comprise over a half of all the mine-lots. These are abundant in the northern part, especially in Ping-an; and the most famous gold mine in Korea is the Wunsan. This mine, which had been worked by Americans from about 1888 to 1895, passed to the ownership of a new company, the Oriental Consolidated Mining Co., the capital of which, all paid up, is divided into 500,000 shares of 20 yen each. This mine now occupies a most prominent place among all the mines in the Japanese empire. It has six mines, each of which has well equipped mills; the machinery is driven by power transmitted from a hydro-electric plant. According to the reports from 1903, 230,000 to 300,000 tons of ore has been annually mined and treated and $2,400,000 to $3,000,000 in gold was produced: an annual dividend was paid, the profits amounting to 930,000 yen for 1908 and 1,110,000 yen for 1909.

When the concession for this mine was first granted to Americans, people of different nationalities endeavored likewise to secure concessions, and various English, Italian, French, and Japanese companies obtained rights. However, all these attempts did not succeed as well as did the American undertaking. Other gold mines, Sakushu (Japanese spelling used for these names), Shojo, Kijo, and Sensen in the northern Ping-an and Suan in the Yellow-sea Province are developing; and among placers, Junan district in the southern Ping-an, and the districts of Zengi, Mokusen, Bugi, and Seishu in Chung-chong are famous. The methods of working are, however, primitive, with little added improvement, and there is ample room for the investigation of better practice; but working on a large scale, as carried on in America and Australia, cannot be introduced before the nature of the strata has been carefully investigated.

Limonite, magnetite, hematite, etc., are produced in numerous localities. In 1899 there were 38 iron mine-lots granted; but owing to poor means of communication, they are not all worked; indeed, only those mines convenient for shipping along the river Tai-dong and its tributaries are worked. However, iron products for 1909 amounted to about 100,000 tons, and owing to great demand from the Yawata Government Iron Foundry, gradually measures for the extension of working were taken, and 130,000 tons were produced in 1910. Moreover, as it is estimated that these mines would not supply more than half of the requirement of that foundry, it appears that the production will hereafter be increasingly larger in amount. Besides, in Angaku, Yellow-sea Province, 40,000 tons of hematite was mined, and it is estimated 50,000 tons for the year 1910, Danpyo 20,000 tons, and Sainei 40,000 tons, etc. In the same province are mines of limonite, which, at the beginning of this year, became the possession of Hachiman Iron Foundry. The ore of Kenjiho is of good quality, and being better situated for transportation the mine will be worked within this year. And the iron ore of Wakakuri in Ping-an, and the micaceous iron ore and magnetite of Shorinbo, in the Yellow-sea Province, will be mined when international conditions and means of communication shall have been improved.

The graphite-producing regions in Korea are wide in their extent. The production of this mineral is of recent date; the export of it, which amounted only to about 20,000 yen a few years ago, has now reached over 30,000 yen; and will, it is expected, still further increase in the future. Its chief producing district is northern Ping-an, where flake graphite of good quality is mined. Though graphite in powder is quite generally produced, it is unfit for electrical purposes and unsuited to the manufacture of good crucibles. When good graphite from Ceylon sold for 300 yen per ton at London, common graphite from Korea was worth but 50 yen, but as the electrical, mechanical, and engineering works are now in prosperous condition, and as graphite is cheap, it cannot be concluded that the demand will hereafter fail, and the future of Korean graphite may be considered as hopeful. According to the return at the end of 1909, the land concessions of graphite were of 109 lots, which come next to the gold mine-lots in number; one-half of the graphite concessions were to English investors.

Coal is produced in many places. The most famous coalfield is the Pying-yang coalfield, stretching 15 miles along the Tai-dong river, where is produced anthracite which is briquetted for use in the Navy. The principal of the three strata has a width of 4

to 27 shaku. There is almost no block coal, all being fine.

Besides the preceeding, Korea has copper mines, among which Kapsan in the southern Ham-kuing and Hu-chhang in Ping-an are famous. The concession for working of Kapsan was obtained by Americans, and according to their report, the ore contains 10% copper, and will, it is said, long afford profit. Besides, the gold mine at Suan in the Yellow-sea Province produces copper; 100,000 tons mined was worth 2,830,000 yen, of which 1,860,000 yen was net profit.

The above are the principal minerals of Korea, but the search for mines is not yet ended, and there is no doubt that minerals to be exploited in the future and those yet to be found are not few. In view of the result of the previous undertakings the future looks bright. For instance, though it may require abundance of capital, all expenses for development, mining, etc., per ton of ore are as follows:

	Yen*.
Development and mining expenses	3.18
Milling	1.16
Transportation	0.03
Cyaniding	0.33
General expenses	0.74
Total	5.44

This cost can not only be well compared with that of the greatest gold mines in the world, but is much less than that of the mines in Australia and Transvaal. Notwithstanding that methods are crude and require much labor, there is a net profit of about 10%, which is undoubtedly due to the low cost of production. In Korean mines, motive power is dear, and so are, of course, consumable materials, which are imported.

To look at the result of the operation of iron mines at Chai-ryong and elsewhere, as the expense of mining and placing on board ships per ton of iron ore is 2 yen, and 30 to 40 sen, while the purchase price by Yawata Government Iron Foundry is about 5 yen and 80 sen, there will be fair profit. Of graphite mines, if we deduct from 50 yen, the price at London, the freight of 12 to 18 yen, there is the balance of 32 to 38 yen; and if we again deduct from these the cost of production, it will be no difficult matter to get a profit of 25% for the capital.

The future of the mining industry of Korea depends upon the Japanese nation. Abundance of capital must be provided, the means of communication and transportation must be improved, and they must abolish the laws which fetter the development of the mining industry; but it is still more important that the habit common to those engaged in the mining industry, that of securing possession of mine-lots for mere speculation, be discontinued or prohibited. Of all the mine-lots granted 575,399 are to Japanese, 145 to natives, and 31 to foreigners; but those possesed by the Japanese, who have the greatest part, which are actually at work, do not exceed 10%, and 90% are left untouched. This is due either to the fact that they occupied so many lots, in order to sell them at high price when the opportunity offers, or to the blind belief that Korean mines could be easily worked with small capital. However, when foreigners would purchase their rights, they ask exorbitant prices for them; on which an American said: "If the Japanese continue this practice, all their mine-lots will fall into the hands of Englishmen and Americans." In short, it is, I think, far better to co-operate with foreigners by making reasonable proposals, or to sell their rights to the latter at moderate price and get the real benefit resulting from the working of such mines, than to possess a great many mine-lots without capital to work them, and thus prevent the development of the mining industry. In conclusion, I have to add that the Japanese want sincerity in the conduct of business. The director at the Wunsan gold mine, Mr. Meserve, has been there in his service for twelve years and superintended the business; and the undertaking has made a profit of about 10%. The great-mindedness of a company that entrusts the management of an enterprise involving ten million yen, and which is 10,000 miles from home, to the same man for twelve years, is admirable, yet a man of integrity and industry like Mr. Meserve, is one most needful for the future development of Korea; and affords, at the same time, a good model for the Japanese.

*Yen = 99.7 cents.

TIN MINING IN BOLIVIA

The annual report of the British legation at La Paz, Bolivia, shows continued activity in tin mining, which furnishes the most important article of export. Shipments during the first six months of 1909 amounted to $6,767,000 (U. S. currency). Among the operating companies the following is mentioned:

Andes Tin Co., an American concern, which has spent a great deal of money on the erection of a hydro-electric power-plant. Its concentration plant is now in course of erection. Patches of rich ore are found, and there is an abundance of water from the melting glaciers above the mines on the high peaks at an altitude of 18,000 ft. The mines themselves are at an altitude of 16,000 to 17,000 feet.

PLATINUM MINES IN COLOMBIA

The National Assembly of Colombia passed a law in October last in regard to platinum mining in that country. The act provides that platinum mines shall be adjudicated by the nation, and that they may be denounced by anyone on the terms and conditions established by the laws on gold and silver mining. It is provided that all adjudications in favor of foreigners in the districts of Choco and Darien shall be suspended until the completion of the work of revising the law. Mines in the beds of rivers are not to be adjudicated, and natives can continue to wash platinum in the river beds.

The tungsten ore found in Signal district, eastern San Bernadino county, California, is hübnerite and is high-grade mineral. The tungstate occurs in a quartz gangue, the vein having a comb structure.

What is Cyanamid?

By John Woods Beckman

The following, in view of some recent discussion relative to improvements in the cyanide process, is of interest to all metallurgists. It is abstracted from *Metallurgical and Chemical Engineering*:

At the present time there are three different substances that go under the name of 'cyanamid.' But only one of these has a legitimate right to the name. The substance with the right to the name is one whose chemical formula is $H_2N.CN$, and the name of cyanamid indicates to the chemist that an amid (NH_2) group is combined with a cyanogen (CN) group forming cyan-amid. It is produced in the following manners:

Cyanogen chloride is introduced into a solution of ammonia in ether, and cyanamid is formed according to the following formula:

$$CNCl + 2H_3N = CN.NH_2 + NH_4Cl$$

If tio-urea is treated with the oxides of lead or mercury in an aqueous solution, cyanamid is formed, and the reaction can be written in the following manner:

$$NH_2.CS.NH_2 = CN.NH_2 + H_2S$$

Also if a cyanamid salt be treated with an acid under special conditions cyanamid will be produced. Pure cyanamid is a white, crystalline, deliquescent mass, soluble in water, alcohol, and ether. It melts at 40° C. One characteristic feature of cyanamid is its tendency to polymerize, forming dicyandiamid, and even higher products of polymerization, such as melam. The polymerization of cyanamid takes place when a solution of cyanamid is being concentrated or being kept for any length of time. If cyanamid be heated to 150° C. it polymerizes with great violence. Chemically cyanamid can be either classed as weak acid or as a weak base. As an acid it will form salts with metals, such as silver, calcium, and others. Of these salts the calcium salt is the most important. As a base, cyanamid will form a number of salts; with acids these salts as well as most of the metal salts are very unstable. Cyanamid, as well as a number of its salts, is an unstable chemical complex that very readily transforms if conditions are right in two different directions, polymerizing forming dicyandiamid, or hydrolizing forming urea. The substance that is most generally known by the name of cyanamid is the product obtained in the process of fixing atmospheric nitrogen with calcium carbide. Cyanamid is the name most generally used for this compound, but a trade name of 'lime-nitrogen' for this product is being used. The only right lime-nitrogen has to the name of cyanamid is that one of the components of the product is a calcium salt of cyanamid.

The chemical formula for 'lime-nitrogen cyanamid' can only be expressed in the following manner:

$$xCaCN_2 + yCaO + zC + uCaC_2$$

From this formula it will be readily seen that this compound is a heterogeneous substance and of no definite chemical composition, nor do its components appear in the same ratio all the time. To explain the composition it is necessary to give, in brief, the chemistry of the formation. If calcium carbide is heated in an atmosphere of nitrogen, the carbide combines with the nitrogen with great avidity, according to the following formula:

$$CaC_2 + 2N = CaCN_2 + C$$

This reaction explains the existence of free carbon in the graphitic modification in the cyanamid, while the free CaO is an unavoidable admixture. The carbide used for the fixation of the nitrogen contains a considerable amount of free CaO as diluent, and this naturally will appear in the finished cyanamid. A small amount of carbide is unavoidable, as it is impossible with the present state of the art to totally bind all the carbide within reasonable time. The chemical nature of cyanamid or lime-nitrogen is a very complex question, and even more so than for the pure cyanamid $NH_2.CN$, on account of the unavoidable CaO. An Italian agricultural chemist by the name of Ulpiani has made some extensive researches on lime-nitrogen, and has found that lime-nitrogen is permanently changing its chemical structure, even only by storing same and under the influence of ordinary atmospheric conditions. What part the air-slacking of the lime may play in this chemical rearrangement of the chemical structure of lime-nitrogen, or, more correctly, the calcium salt of cyanamid, is hard to determine. The calcium cyanamid is of an unstable structure and forms with great ease polymerized as well as hydrolized compounds. In treating the lime-nitrogen with water, even with small amounts, still more complex phenomena take place, basic as well as acid calcium cyanamid salts are formed, with the free lime present; urea is formed; calcium cyanamid carbonate may be formed, and a quantity of others, including dicyandiamid and free ammonia. Ulpiani has made extensive research regarding the action of lime-nitrogen with various acids and in various solutions, and these are able to spread a good deal of light over an exceedingly complex chemical problem, which is growing more and more important as new uses for cyanamid are developed.

These researches of Ulpiani have also shed light on the fertilizing value of cyanamid, and he proves conclusively that it is not cyanamid or dicyandiamid that is the direct fertilizing ingredient in lime-nitrogen, but it is the result of hydrolization, the urea, which is acted upon by the bacteria, and ultimately transformed into a nitrogen compound that can be absorbed by the plant.

The third product that claims the name of cyanamid bears it only as a trade name. Lime-nitrogen is mixed with a certain percentage of sodium nitrate and with a low-grade nitrogeneous material as a diluent to regulate the nitrogen contents of the finished product, and is then called 'cyanamid.' This material is compounded exclusively for the fertilizer trade and is of no chemical importance. It is apparent from the above that the name of cyanamid is one that has lost its original meaning and has

come to indicate altogether different substances to different groups of people. The name 'cyanamid' should stand for the chemical compound known by the formula, H_2CN_2.

'Lime-nitrogen,' although a meaningless name, as meaningless as if gypsum were called 'lime-sulphur,' may remain the name for the product now generally known as 'cyanamid,' while for the third product a name like 'cyanamid compound' or 'lime-nitrogen compound' would probably answer, thus clearing up a question of names that is becoming more and more complex the wider the field stretches in which 'lime-nitrogen' can be used.

BOUNDARIES OF MEXICAN MINING CLAIMS

The Mexican mining law which went into effect January 1, 1910, contains the following, relative to marking boundaries:

Article 7. The period of one year is granted to mining proprietors who have not marked the boundaries of their mining claims with monuments in order that they may do so. The one who does not comply with this provision shall be responsible for the damage and loss which he causes a third party, and, besides he shall incur a fine of ₱100 to ₱500 ($50 to $250 American currency), which the Department of Fomento shall impose upon him on receiving verified notice of the infraction.

If, after the fine has been imposed, the responsible party should persist in the omission for a period of thirty days he shall be consigned to a judicial authority in order that he may impose upon him the penalty for disobeying legitimate order of authority, and the Department of Fomento may also have the monuments constructed at the expense of the interested party.

TEXAS GASFIELDS

Natural gas in Texas, according to a report recently issued by W. B. Phillips, is used in several cities. Dallas and Ft. Worth, with a population of about 170,000, are supplied from the Clay county fields, south of Red river. The gas is piped 110 miles and the base price is 50c. per 1000 cu. ft., with a substantial reduction to large and regular consumers. Wichita Falls, Wichita county, pipes its gas from the Clay county fields also, and the price is 9 cents. In addition to these cities, Laredo, Webb county, on the Rio Grande, also has natural gas piped for 20 miles, while Atlanta, Cass county, and Corsicana, Navarro county, have local supplies that could be much more extensively used than is the case at present. There are four known gasfields in Texas which appear to have sufficient gas for all ordinary purposes, in the counties of Clay, Cass, Navarro, and Webb. The Clay county gas comes from the same general field as the oil. The Navarro county gasfield is closely associated with the Corsicana and Powell oilfields. There is probably another large gasfield in Texas which has not been developed. It is from 15 to 20 miles south and southwest from San Antonio and lies between the San Antonio and the Medina rivers and along this latter stream from its confluence with the San Antonio. Good pressure has been observed in this field and it is likely that a large quantity of commercial gas could be secured. It would be difficult to find a more favorable locality for the introduction of natural gas than San Antonio. The price of coal in Texas runs from $5 to $6.50 per ton. Even the lignite production does not begin to supply the demand.

WHITE HORSE DISTRICT OF CANADA

White Horse is at the head of navigation on the Yukon river, or more properly the Fifty Mile, a tributary and headwater of the Yukon, and is the northern terminus of the White Pass & Yukon railway. It is the transfer point from rail to river service of the White Pass & Yukon railway, which service extends about 560 miles, from Skagway, Alaska, to Dawson, Yukon Territory. Its population in summer is about 1500 and in winter 250. The season of open navigation extends from June 5 to October 10. During winter the White Pass & Yukon railway maintains a stage service between White Horse and Dawson. There is railway service between White Horse and Skagway daily except Sundays. On the river division the service is such as facilities will permit, about four boats a week. At close of navigation the stage service commences, using wheels until sleighing is practicable, about November 15. There is a weekly service while the wheeling lasts, then a triweekly service by sleighs. The run to Dawson, 325 miles, on wheels is made in six days, on sleighs in five days. The Canadian Government has constructed a wagon-road between White Horse and Dawson, which is 125 miles shorter than the river distance.

Deposits of copper were discovered in this district in 1898, since which time efforts have been made to operate, but generally by parties without sufficient means to handle successfully the low-grade ore produced. Recently, however, the Atlas company of Spokane has expended $50,000 to $75,000 in improvements on the Pueblo mine, having installed modern machinery, erected substantial buildings, etc. The White Pass & Yukon railway has erected at Skagway ore bunkers and equipment for transferring the ore from cars to ships. By this equipment ore was handled to the ship at the rate of 300 tons per hour. The mineral belt extends for ten miles or more. The copper of this district, though of low grade, from 3 to 5%, is in demand by smelters on account of its fluxing qualities; hence a very low smelting rate is obtained. Twenty-five miles south of White Horse is the recently discovered Wheaton silver-gold quartz district, the properties in which have not yet proved their value, but so far as work has been done the outlook is promising. Fifty miles south, along the shores of Lake Atlin and arms, is an extensive section called the Conrad district, two or three mines in which are regular shippers of silver-gold ore, which goes to the Tacoma Smelting Co. The principal shipper is the Yukon District Gold Mining Co., whose mine is owned principally by William MacKenzie, a Canadian capitalist, but is managed and operated by J. H. Conrad.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

An Explanation Wanted

The Editor:

Sir—Possibly the explanation of the good results obtained by I. A. Jackson, Jr., when using potassium acetate in his cyanide solution and a mixture of lead oxide and shavings in the top-box, may be due to the fact that such a solution dissolves a little lead which would be reprecipitated on the zinc-shavings, forming a lead-zinc couple, which is known to be effective in precipitating gold from foul, or weak, solutions. If your correspondent had arranged for a small quantity of lead acetate solution to drip into the first zinc-box, he might have obtained an equally satisfactory result.

H. JONES.

Minas Geraes, Brazil, December 16.

A B C of Empire Drilling

The Editor:

Sir—In the article by Messrs. Hutchins and Stines in the January 7th issue, on the 'A B C of Empire Drilling,' the ground in which the drilling was done was apparently firm and without boulders. In company with J. J. Martin, I had occasion to use this drill on the Unuk river, British Columbia, last fall. The ground to be tested was a loose gravel and sand containing boulders up to 2 ft. diam. On account of its extreme looseness, the drill could not be started as described in the article. It was found necessary to sink a pit about 4 ft. deep and 4 by 3 ft. area. The cutting-shoe, attached to the pipe, was then placed in the centre of the hole, and the excavated material, the volume of which had been carefully measured, and which had been washed to recover the contained gold, was shoveled back into the hole, care being taken to keep the pipe vertical. At times boulders of some size were reached in sinking, usually of granite or gneiss, and even at a depth of 20 or 25 ft., owing to the looseness of the ground, the cutting-shoe would often work around the side of the boulder, throwing the whole pipe out of plumb and interfering seriously with the pumping operations. To offset this difficulty, a 'dead-man' was buried about 2 ft. deep just inside the circular path traveled by the horse pulling the sweep, exactly in the direction in which the pipe was leaning. Braced against this was laid a tree 8 to 10 in. diam. and long enough to rest against the pipe about 3 ft. above the ground. The tree was forked or notched to hold it firmly against the pipe. By nailing on a few planks as a support, it was weighted down with about 200 lb. of rock, and then, by the vigorous use of a 16-lb. sledge, was driven down until the pipe was again in vertical position. The 200-lb. weight served to keep the brace in position while the pipe was revolved, as without it the brace would work up in a few turns of the pipe. It would also be well to have plenty of cutting-shoes on hand, especially if there is any likelihood of running into boulders, as in over half the holes drilled the shoes had teeth broken off, and in one case half the shoe snapped off.

Amalgamation Following Fine Grinding

The Editor:

Sir—I read the contribution by C. F. Spaulding in the issue of the *Mining and Scientific Press* of December 31, on 'Amalgamation Following Fine Grinding', with great interest, and, I believe, some profit. Without doubt there are many places where a high extraction of gold from ores can be obtained by this very simple method. The suggestion which most attracted me in Mr. Spaulding's article was his proposal to utilize a revolving amalgamating-barrel provided with interior radial 'wings' which were calculated to promote the efficiency of amalgamation. That his idea is correct, I believe to be true, and also feasible. In fact, Mr. Spaulding practically describes a machine which was introduced in San Francisco about 1893, or perhaps a year or two later, which was known as the Gold King amalgamator. It consisted of a cylindrical iron shell, about 5 ft. long and 12 in. diam., so arranged that it could be tilted somewhat from a horizontal position, the grade being adjustable within the limit of 2 or 3 inches. This cylinder was divided into two parts longitudinally, the upper half being attached to the lower by several hinges, so that the interior of the machine was rendered accessible by throwing back the upper half. It was lined with silver-plated copper plates and was provided, as suggested by Mr. Spaulding, with four radial wings of copper plate which extended the full length of the machine. The cylinder rotated about its longer axis, the pulp being introduced by means of a hopper at the upper end and discharging through an aperture at the centre of the lower end. In its rotation the pulp came again and again in contact with the amalgamated surface of the plates, and, contrary to theory, did not scour if there was any gold to amalgamate. Any plate will scour from the action of passing mill-pulp, if there is no gold present to build up a layer of amalgam. The Gold King amalgamator did splendid work at a number of places, but so strong was the almost universal prejudice of boss millmen against any mechanical device to assist in amalgamation, that it was found very difficult to introduce the machines in California mills, and to keep them there until an impartial trial had been given them. I saw the gold amalgamated in this machine from concentrated black sand from an Alaska beach, and also saw the plates of a machine cleaned up that had been run on quartz-mill tailing, the machine making a very creditable saving.

W. H. STORMS.

San Francisco, January 20.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Ocean steamships cost, per ton of capacity, an average of $71. Lake steamers cost $41.50, river tow-boats and barges suitable for carrying 10,000 tons of freight on 8½-ft. draft, $12, and railway freight cars, approximately $20 per ton of capacity.

Patent for a lode claim includes all the surface within the boundaries of the claim, not excepted in the patent itself. A subsequent locator of an overlapping placer claim acquires no rights within the limits of the lode claim.

Specular iron is very often mistaken for galena. When uncertain, scratch the mineral with the point of a knife-blade; galena makes a lead-black streak and specular iron one which is dark red. Specular iron sometimes contains gold. An instance occurs at the old Roberts mine on Castle creek at the south end of the Bradshaw mountains in Arizona, as also in Brazil, where the iron is auriferous.

A mill, or other machinery, placed on a mining location, or in the vicinity, for the treatment of ore from the claim or group of claims, is properly chargeable to 'annual labor' performed on the mines themselves. However, the machinery should be placed in position as soon as possible, or it may be construed as a subterfuge, the machinery not in place being easily movable from one site to another.

Base ore assaying but $1.10 per ton, no matter what the metal representing this, whether gold, silver, lead, zinc, copper, or other metal, is too low grade to afford a profit under ordinary working conditions in Montana, or, in all probability, anywhere else, and if there is a company in Montana operating a mine at a profit producing ore of this character this department has no knowledge of it.

Nitro powders must not be thawed rapidly, nor chilled quickly. This class of explosives should be kept constantly at as near a normal temperature as possible—70 to 80 degrees. This can usually be accomplished by storing the powder in a stone or concrete warehouse having thick walls. Only sufficient for the day's use should be kept in the mine, and no large amount at any one place underground. Where several boxes of powder are required daily, it should be distributed to as many separate places as possible, to minimize serious disaster in the event of a premature explosion.

Boiler explosions are frequently caused by the water becoming too low. Be careful that the proper amount of water is in the boilers when in service. Don't fail in this. Don't permit the water to get low. Don't depend on the automatic water-feeder. See to it yourself that the boiler gets the proper amount of water. Don't fill an empty boiler with water when there is a fire in the furnace or when the furnace walls are hot. Don't let any one else do this. Remember that water coming into contact with hot metal will crack the metal. Don't permit any person to draw water from the boiler when there is a fire under it. Your personal safety and the safety of the boiler require strict observance of this rule.

The diamond mines at Kimberly, South Africa, have now been worked by underground method for nearly twenty years. Mining was all formerly by open pits. The diamond ground is now reached by means of levels run from vertical shafts, sunk at some distance from the rudely circular deposits, in what is called the rim or edge of the pit. Mining operations at these mines are on a very extensive scale, and although thousands of tons are broken down and hoisted daily, much of the diamantiferous earth lies exposed to the weather for four years to permit disintegration before it is sent to the crushing mills.

One element of danger in shafts not kept in first-class condition arises from the liability of skips, buckets, or cages getting 'hung up' in the shaft while descending, the engine continuing to unwind the cable, which coils up about the carrier in the shaft. Sometimes this accumulating weight causes the obstruction to be forced aside and the skip takes a drop of a greater or less distance, generally with disastrous consequences. On one occasion when an accident of this character occurred, the rope continued to unwind, a loop of it descending some distance below the skip. The latter suddenly broke away and fell, passing through the loop, tying the cable in a hard firm knot which it was impossible to untie. The cable was cut above and below the knot with a hack-saw and the knotted section of cable was placed in the California State Mining Bureau, at San Francisco, California.

Horse-power is an arbitrary measure of the duty required of, or done by, a motive force, whether it be water, steam, electricity, gas, or some other form of energy capable of being controlled and utilized. Before the steam-engine was invented, either water or animals, though sometimes human beings, supplied the needed force. When the steam-engine began to be utilized, and standard for measuring the power developed by this new device was required, it was then that James Watt made experiments which resulted in fixing as the capacity of a large powerful horse the lifting of 33,000 lb. 1 ft. in one minute. This has since been the basis of estimating the power capacity of engines, water-wheels, and other devices capable of transmitting energy. To estimate the power of an engine of the piston type, a very simple formula has been devised: $Hp. = \frac{PLAN}{33{,}000}$ where P is the pressure of steam or air in pounds; L is the length of stroke of piston in feet; A is the area of the piston in inches, and N is the number of the strokes of the piston per minute. In engine design the diameter of the piston always bears a reasonable relation to the length of stroke. The latter is seldom less than the diameter of the piston, nor does it often exceed twice its diameter. High-speed engines usually have a relatively short stroke, and slow-speed engines a long stroke.

Special Correspondence

WASHINGTON, D. C.

Synopsis of Bill Providing for Leasing Alaskan Coal Lands. — Proposed Disposition of Cunningham Claims.

The one result likely to come out of the controversy over the Cunningham coal-land claims in Alaska is a definite law under which Alaska's resources may be developed. The controversy put the Alaskan situation squarely before Congress years before it might otherwise have been reached. The President recently called a number of the members of Congress and his Secretary of the Interior into a conference, and urged the necessity of prompt action on the coal lands of Alaska, the oil situation in California, and the general subject of appeals from the Department of the Interior. Those present were Knute Nelson, of Minnesota, chairman of the Senate Committee on Public Lands; Reed Smoot, senator from Utah; Frank P. Flint, senator from California; Frank W. Mondell, of Wyoming, chairman of the House Committee on Public Lands; and Herbert Parsons, of New York, also a member of the House Committee on Public Lands. As a result of this conference, five bills have been introduced in Congress—three by Senator Nelson and two by Senator Flint. They are as follows: By Mr. Nelson, to provide for the leasing of coal lands in Alaska; to provide for appeals from decisions of the Secretary of the Interior to the Court of Appeals of the District of Columbia; authorizing the validity of certain coal-land entries in Alaska to be tried and determined by the Court of Appeals of the District of Columbia. By Mr. Flint, to provide for the granting by the Secretary of the Interior of permits to prospect for oil and gas upon mineral lands of the United States, and of leases of public lands for the production of oil and gas after discovery; and a bill to protect the locators in good faith of oil and gas lands who shall have effected an actual discovery of oil or gas on the public lands. The most important of these is the bill providing for the leasing of coal lands in Alaska. It provides that all lands in Alaska to which patents have not been earned or to which vested right has not been acquired, and which contain deposits of coal, are reserved from all forms of entry, appropriation, and disposal except under the provisions of this act; that all other minerals in such lands shall be expressly reserved to the United States and from disposition under this act; that any citizen of the United States, association, or corporation of such persons may apply to the Secretary of the Interior for a license to prospect and explore for coal, or for a lease to mine and extract coal from an area of land not exceeding 3200 acres in any one license or lease. The license to explore will be for a term not exceeding two years and the compensation shall be 25c. per acre for the first year and 50c. per acre for the second year, with the privilege of leasing the coal on the lands. After the discovery of coal, the locator may obtain a lease to run 30 years, at a royalty to the United States of 5c. per ton of coal extracted if the lease is made within 10 years from date of the passage of the act; if the lease is made after that period, then at a royalty of 6c. per ton, and in addition to such royalty a rental is to be paid each year as follows: 50c. per acre for the leased premises for the first year, $1 per acre for the second year, $2 per acre for the third year, and $4 per acre for each and every year thereafter during the continuance of the lease. Such rental for any year shall be credited upon the royalty accruing during that year. Every such lease granted under the provisions of this act shall be upon the conditions that the lessee shall not monopolize, or attempt to monopolize, the trade in coal; that the lessee will at all times sell the coal extracted at just, fair, and reasonable rates, and without any discrimination in price as to persons or places, the Interstate Commerce Commission to have jurisdiction over the territory and the laws relating to common carriers to apply. The Secretary of the Interior may renew a lease for an additional period of ten years, but in such cases the royalty shall not be less than 6c. nor more than 15c. per ton run-of-mine. The lessee shall not, without the consent of the Secretary of the Interior, assign his interest in the leased premises to anyone else. The Secretary may issue a limited license granting the right to prospect and mine for domestic use, and to dispose of for local consumption, coal belonging to the United States, a specified area, not to exceed 40 acres to any one person for a period of not exceeding 10 years, on the payment of a royalty per ton of coal. It shall be the duty of the Secretary of the Interior to ascertain as soon as may be whether any of the coal deposits are suitable and well adapted for the use of the Navy of the United States, and if such deposits are found, the Secretary under the direction of the President, may withhold and withdraw the same from exploration and lease under the preceding provisions of this act. The Secretary of the Interior, in conjunction with the Secretary of the Navy, may, on behalf of the United States, lease such coal deposits for the purpose of mining the coal and supplying the same to the Navy and the revenue cutter service at an agreed price per ton, to be specified in the lease, and as to such coal furnished the United States, no rental or royalty shall be paid therefor by the lessee, but the same shall be taken into account in fixing the price at which the coal is to be supplied to the United States.

The third bill presented by Mr. Nelson provides that the Commissioner of the General Land Office shall, within 90 days after the passage of this act, certify directly to the Court of Appeals of the District of Columbia, a transcript of the entire record on file in his office of the so-called Cunningham coal claims, these claims to be finally passed upon by this court. This course is opposed by Gifford Pinchot, the former Forester, who recently stated his views on the Cunningham claims in a brief presented to Mr. Taft. Mr. Pinchot declares that no resort to a court or rehearing of the case is necessary to secure justice and protect the people's property. "The case against the claimants is already conclusive," says Mr. Pinchot. "I believe the duty of the Executive in regard to the claims is obvious and immediate. The claims should be canceled by the President forthwith." James Wickersham, of Fairbanks, Alaska, delegate to Congress, has introduced a bill dealing with the mining interests of Alaska. He would have it provided that no association placer-mining claim shall hereafter be located in Alaska in excess of 40 acres; that on every single and association placer-mining claim hereafter located in Alaska, and until a patent has been issued therefor, not less than $100 worth of labor shall be performed or improvements made during each year, including the year of location, for each and every 20 acres. He would also provide that not more than two association placer-mining claims shall be located by or for any association of persons in any month, and not more than 24 in any year. The urgent deficiencies bill, which has already become a law, carried with it $100,000 for the investigation of the mineral resources of Alaska.

JOHANNESBURG, TRANSVAAL

Development of the Cinderella. — Change in Transvaal Practice. — Artificial Methods of Ventilating Mines.

The Cinderella Consolidated, an important amalgamation of General Mining & Finance Co. and Barnato Bros. interests in the neighborhood of Boksburg on the East Rand, gives promise of becoming one of the foremost gold producers of South Africa. At present, development is progressing rapidly in order to prepare the mine for the increased scale of producing operations to which the company is pledged. In order to facilitate exploitation of the mine, sinking of a new central shaft was commenced a short time ago and good progress has been made. This shaft has seven compartments, and erection of the permanent steel headgear and ore-bin has been completed, while the depth attained in the shaft at the time of writing is between 100

and 200 ft. In the past it has been the practice in the Transvaal to erect temporary sinking headgear at the outset of sinking operations and not to proceed with the erection of the permanent structure until the bottom of the shaft is approaching its ultimate depth. Of late, however, a different practice has come into favor and at both the Government gold mining areas on Modderfontein and at the Cinderella Consolidated, the erection of the permanent headgears has been undertaken at the commencement of sinking. Practical proof of the earnest desire of the big mining companies to improve the ventilation of the underground workings along the Main Reef is to be found in the extent to which artificial methods are being introduced to increase the volume and the quality of the air circulating through the various properties. It has been charged that the Rand has been backward in the matter of artificial ventilation. Perhaps this charge has not been wholly unfounded, but, generally speaking, the conditions obtaining in the majority of mines have compared favorably with those prevailing in other gold mining districts. However that may be, the East Rand Proprietary Mines, Cinderella Deep, and Village Deep took the lead a little while back in the installation of fans, and it is now important and satisfactory to learn that at the Crown Mines, City Deep, Rose Deep, Nourse Mines, Robinson, and New Modderfontein, fans are to be installed and elaborate systems of ventilation carried into effect. The types of fans in chief favor are of the Sirocco and Ratteau makes.

BUTTE, MONTANA

Litigation Over the Parrot.— Committee of Legislators Inspects Mines to Investigate Conditions.— Affairs of Butte & Superior.

Two of the minority stockholders of the Parrot company brought a suit in the United States Court asking that the sale of the property to the Anaconda company be set aside on the ground that the property was disposed of at a price not commensurate with its value. The case came up in Judge Lynch's court when an attorney representing B. N. Richardson, H. B. Jackson, Isaac Bradford, and Mary A. Knight, all of Boston, asked that the application made several months ago for the appointment of appraisers to value the property be dismissed, as a settlement had been effected. The request was granted, and then an attorney on behalf of William F. Wall and Louis Foss of Boston asked that the matter of the application of his clients for the appointment of appraisers be continued until a suit he had just filed in the Federal court is disposed of, and it was decided to allow the question of appraisers to go over for one week. The complainant sets forth that the party to the suit owns 1210 shares of Parrot stock, and that in 1899 the Anaconda company entered into a conspiracy to deplete the assets of the Parrot and get possession. It is stated that, possession having been secured, the Parrot smelter was closed and the treatment of the ores turned over to the United Metals Selling Co., which turned it over to the Anaconda company. It is alleged that this caused a loss to the Parrot company of $500,000. It is further claimed that the smelting works at Gaylord were dismantled, causing further loss of $1,000,000. The sale of the Adventure claim to the Red Metals company is alleged to have resulted in a further loss of $1,000,000; that real estate and mining claims were sold to various parties, entailing a loss of $10,000,000. It is claimed that a reasonable value of the property is $50,000,000, and that the dumps and tailing are worth $5,000,000. In conclusion, the complaint says that at least $100,000,000 has been lost to the stockholders through the bad management of affairs, which, added to what would be a fair value of the property if handled by the company itself, would make about $200,000,000.

From time to time one hears statements to the effect that many of the underground workings of the mines in this district are not fit for a human being to work in, so when P. J. Duffy, a member of the State Legislature and a former president of the Miners' Union, introduced a resolution in the House calling for a joint committee of the two houses to investigate conditions, it was promptly passed, and just as promptly the two committees came to this city. Accompanied by the president and vice-president of the Miners' Union and officials of the Anaconda company, the committees inspected the underground workings of nine mines in two days. The secretary of the committee carried with him a thermometer and at places where it was claimed that the heat was practically unbearable, the temperature was taken. The Miners' Union representatives pointed out to the committee the worst places in the mines, and the legislators stopped and conversed with the miners at work as to the ventilation in drifts and stopes. In one place where it was reported to the law-makers from an outside source that the men could not work more than 25 minutes at a time, one of the miners was asked by a committeeman how long he could work there, and his reply, as given by a person who heard the question and answer was: "Why, I can put in my eight hours and then go out and have a h— of a time during the night." In speaking generally as to the inspection, the chairman of the committee said that none of the miners was found

Butte Mining Scene.

who had any particular complaint to make as to conditions. In several places visited the thermometer was found to register from 90 to 93 degrees, and in one place it registered 98. He said the fan system of ventilation was used in several of the mines and appeared to be successful. He believed that if the fan system was used in all the mines and that if toilet-cars to improve sanitary condition were used, the miners would not have much reason to complain. While the production of the Coalition mines has been reduced, the value of the ore coming from the Minnie Healy and Tramway mines of that company is said to be the richest ever mined in this district. It is predicted that when the time comes for increased production the Coalition property will surprise everybody. According to the statements of A. B. Wolvin of the Butte & Superior company, financial arrangements have been made for carrying on the work and that before the close of the year money sufficient to meet all obligations will come from the net earnings of the company. He says that since July 1 the company has made a net profit of $110,676.92, and the average earnings for October, November, and December were $25,000 per month, net. During December 500 tons of ore was shipped daily to the Basin concentrator, and about March, it is claimed, the output will be increased to 600 tons daily. Mr. Wolvin estimates that at the prices prevailing, with a 600-ton daily production, the property will earn $1500 net per day. The holders of bonds coming due January 1 have extended the time for one year. Reports from reliable sources say that the North Butte is showing well, and that high-grade ore is being blocked out. It is stated that only a small portion of this ore is being sent to the smelter, but it is being held in reserve.

LONDON

The Orsk Goldfields Ltd. — British Broken Hill Proprietary. — Oroya Black Range, Western Australia. — The Dunderland Iron Ore. — The El Oro.

The Orsk Goldfields Ltd., which operates the Kolchan placers, near the mouth of the Amur, Siberia, is increasing its capital from £750,000 to £920,000 by the creation of 170,000 priority shares of £1 each. These shares will be entitled, in priority to the preference and ordinary shares, to 85% of the profits of the company available for dividends in every year, and 100,000 have been offered to shareholders in proportion to their holdings. The parent company, The Siberian Proprietary Co., has guaranteed the subscription of 80,000 of the shares, the consideration being the right to subscribe at par for 60,000 other priority shares until December 31, 1912, and to subscribe for any of the 100,000 not now taken up by shareholders. The reason why new capital is required is that the steamer *Karema*, carrying the company's new dredge, was the victim of a collision when only two days out from New York, and had to put back to port for a month. The consequences was that she arrived off the coast of Siberia too late to deliver the dredge at Nicolaievsk before the winter stopped navigation, and the dredge had to be stored at Vladivostok until June 1911. The forced postponement of production and income made it necessary for the company to reconsider its financial position. Another adverse circumstance has been the delay in getting the Pokrovsky plant, consisting of a Page-Crawford excavator and sluice-box, into working order. C. W. Purington, the company's manager, was therefore recalled to consult with the directors as to the general prospects in Siberia. During the last few days cables have come from D'Arcy Weatherbe, who is in charge of the Pokrovsky plant, announcing that two trial runs had been made. In the second run 50 cu. yd. of gravel were washed and the clean-up yielded 2 roubles, or 4s. per cubic yard. Considering the conditions of work during frost this result is sufficiently notable to attract attention and foreshadows remarkable results when the plant is put in regular commission next May.

The information contained in the review of the zinc position at Broken Hill that appeared in your issue of January 7 might be supplemented by an account of what is going on at the British Broken Hill Proprietary; the review is not really complete without it. This company owns Blocks 15 and 16 on the Barrier range, situated between the properties of the Block 14 Co. and the North Broken Hill Co., and has not been so successful as others in the district on account of lower value of ore. During periods of depression in metal prices work has had to be suspended. Operations had been at a standstill since December 1907, and in the meantime the lead concentration plant has been re-built and an Elmore plant provided for the treatment of the zinc tailing. The new plant was started on June 15 last and its capacity has gradually been increased until during the 28 days ended December 10, 10,295 tons of ore was treated, yielding 1503 tons of lead concentrate, containing 954 tons lead and 37,575 oz. silver; also, 1738 tons of zinc concentrate containing 739 tons zinc, 191 tons lead, and 18,266 oz. silver. The recovery was 70% of the lead and 80% of the zinc. Further additions are being made to the plant and the extraction should be gradually increased. Development work has not yet been resumed, but plans are ready for exploratory work in the lower levels of Thompson's shaft. In order to provide additional capital for development and for additions to the concentrating plant, £30,000 debentures carrying 6% interest are to be issued. Another interesting item of Broken Hill news relates to the Broken Hill South Extended. This block has been hitherto unsuccessful and the company has been reconstructed twice. Except for a small dividend in 1891 the shareholders have received no return. The property consists of Blocks 52, 53, 89, and 90, the work being confined to the first named, and adjoins on the south the mine of the Broken Hill South Blocks. Recently a new main shaft has been sunk with the idea of exploring at greater depth. At 930 ft. the mineralization was so promising that diamond-drilling was undertaken in both eastern and western directions, and the former disclosed three bodies of zinc-lead sulphide, and a cross-cut was immediately commenced. T. G. Sweet, the manager, reports that this cross-cut is now out 330 ft. and has passed through four orebodies. Those most distant are close together and the two practically form one body 70 ft. wide. In September Mr. Sweet began to drive north and south at this point, and by the middle of November 100 ft. had been driven, all in ore. The assays show from 20 to 30% zinc, 14 to 20% lead, and 3 to 4 oz. silver per ton. The prospects of opening large amounts of profitable ore are encouraging and work is being concentrated on the 930-ft. level instead of sinking the shaft deeper.

Some of the developments in Murchison, Western Australia, are interesting English investors. One of the companies, having the advantage of the advice of H. C. Hoover, is the Oroya Black Range. This company was formed in 1906 to acquire the Sandstone leases in the Black Range district, East Murchison. Bewick, Moreing & Co. are the managers, William Pollard is superintendent, and H. C. Hoover and J. H. Cordner-James are on the board. The company is an offshoot of the Oroya Brownhill, of Kalgoorlie, and was formed when the latter was showing signs of nearing the end. The capital is £199,890, and dividends, commencing in 1908, have totaled to date 32½%. The results obtained on the third, fourth, and fifth levels are not so good as was expected, and the ore developed has not quite kept pace with the capacity of the mill. It is estimated that the reserve is sufficient for seventeen months. There are some parts of the mine where developments are hopeful. During the year ended August 31, 54,180 tons was raised and treated, yielding by amalgamation and cyanide 27,806 oz. valued at £118,072. The expenditure at the mine, including £13,495 for development, was £83,185, and after allowing for depreciation and paying London expenses and taxes, a profit was left of £24,516. The dividends for the year were 21½% and absorbed £24,986. As an offset against the disappointing results at Black Range, the company has recently acquired a useful asset in the form of 50% interest in the Youanme property, situated sixty miles to the southwest. The other half interest has been acquired by the Oroyo Exploration Co. This property measures 3900 ft.

along the outcrop, and two lodes have been found, that in the opinion of the engineers may prove to be branches of the same. A shaft has been sunk near the centre of the property and drifts commenced at 44 ft., 80 ft., and 170 ft. At the 80-ft. level, 1020 ft. is in ore, having an average width of 5 ft. 6 in., and a value of 50s. per ton. Another shaft to the south is also giving good results. It is estimated that 50,000 tons of ore averaging 50s. is ready for extraction.

I have several times referred to the Dunderland Iron Ore Co. which was formed in 1902 to acquire iron-ore deposits at Dunderland near the port of Mo, on the Ranen Fiord, west coast of Norway. It was promoted by Sir Joseph Lawrence, and many iron-masters in the North of England and South Wales lent support and subscribed capital. Subsequently the Consolidated Gold Fields of South Africa took an interest. The deposits consist of hematite and some magnetite in a gangue that contains apatite. The Edison system of crushing-rolls and electro-magnetic separators was adopted. The ore was crushed fine and the concentrate was to be made into briquettes. Unfortunately these processes were not tested thoroughly before plant on a large scale was erected, and one after another of the various parts of the plant failed to answer, and much additional capital had to be subscribed from time to time. The final collapse came about two years ago when it was found that the principle of dry crushing and concentration was not favored by the workmen. The dust was too great for safety, to say nothing of comfort, and as the population of Norway is not so great as to make it necessary for the workers to accept any terms and conditions the plant was deserted and the project abandoned. More recently the Ullrich wet magnetic concentrator has been tried and is now being tested on a small scale at the mines, under the advice and supervision of Henry Louis, who has been the technical adviser from the first. Information as to the results obtained by Mr. Louis is expected at any time. During the last few months the board has been reconstituted and the secretary has resigned. D. A. Bremner was appointed as general manager three years ago when the situation was beginning to be acute, and he still remains at his post. The share capital of the company is £2,000,000, divided equally into ordinary and 6% preference. There are £500,000 first debentures and £30,530 second debentures, £200,000 prior-lien bonds, and £81,043 funded interest certificates, all of which have been issued from time to time to keep the company going. The arrears of preference dividend represents a further £375,000.

You will have heard of the crisis in the life of the Mexico Mines of El Oro, one of the best managed and remunerative gold mines ever known in the London market. The daily papers have contained a good deal about it. The property was taken over by the Exploration company, and under the chairmanship of R. T. Bayliss and the management of R. M. Raymond, became a most profitable mine. With a low capital, £180,000, the rate of dividend has been high. A year ago French investors evinced a desire to acquire shares and the quotations of the £1 share was rushed to nearly £10. Mr. Bayliss was much averse to this great enhancement and would not do anything that savored of an encouragement of it. When the representative of the French shareholders wanted him to facilitate a quotation for the shares on the Paris Bourse he objected, knowing that such a course would only tend to raise quotations still higher. Eventually a crisis was precipitated because the French shareholders became so numerous as to be in a majority, and Lord Cowdray, better known as Sir Weetman Pearson, head of the firm of S. Pearson & Son (well known in Mexico) threw his lot in with the French shareholders because the extensive buying of these shares in France had been due to his influence. This opposition party gave the necessary notice for the convening of a meeting of shareholders and moved a resolution removing Mr. Bayliss and some of his confreres from the board. Finding himself in a minority, but only after stating his case and position very clearly, Mr. Bayliss handed in his resignation and with it the control of the company. It is a pity that two such eminent and honest engineers as Mr. Bayliss and Lord Cowdray should be at loggerheads, and that such a disruption should occur in the Exploration company's group. Mining administration is always being criticised; what can the public think of the honorable nature of mining engineers when such unnecessary bickerings between really sound men take place in this way?

NEW YORK

The Copper of the Future. — Calumet & Hecla Merger. — Porcupine and Kerr Lake.

Something like a year ago, J. Parke Channing gave out an interview covering the copper situation from the standpoint of the producer and drawing some comparisons between the copper ore reserves of the country and the standing timber available for lumber. The present temporary overproduction of copper has largely blinded both producers and consumers, and the spirit shown in most instances is very much like that of the lumberman, who, 25 years ago was wont to claim that the Michigan and Wisconsin pine forests could supply the world with white pine until the end of time. The white pine woods of the lake regions are gone and white pine has become almost a luxury; since the exhaustion of the Northern woods, the growing commercial needs of the country turned to the Southern pine forests and between turpentine and lumber, nearly every sapling in the South has succumbed to knife or axe. In view of the peculiar situation in copper, it is of interest to study our gross resources, especially with an eye to the additions made thereto within recent years. The first fact which is impressive is that within the past few years there have been no important discoveries made in the way of new big copper deposits. The attention of all copperdom has been fixed upon the development of the porphyries, but these mines are not new. The existence of the orebodies now being mined has been known to mining men for years; it is only the manner of working that is new; the application of methods, rather, for the steam-shovel has long been in use on the Mesabi range. While the proving up of the large bodies of low-grade ore makes for certainty in the life of and profit to be derived from the porphyry mines, it also makes more certain the date of exhaustion, and when the important producers are numbered and probable production estimated, even on a liberal basis, it begins to be plain why such men as J. B. Haggin have poured millions into properties in Peru, why the Guggenheims have gone into Alaska and into Chile, why the heart of the dark continent is being explored for copper, and Russia, Siberia, and China are being prospected. In our own copper districts there is really nothing new being added. In Butte there have been one or two mines made, as in the case of Tuolumne, East Butte, and Butte Ballaklava, but these can not be ranked as discoveries. The Lake Copper Co., in the Michigan copper country, comes nearer being an actual addition to known copper resources. In the Southwest, there is a splendid era of development, but little or nothing that can be called new. In the meantime, while production is increasing, consumption has also been increasing; the former is limited to our natural resources, the latter will continue to increase as long as cheap copper encourages the seeking of new uses for the metal. With statistics compiled more and more accurately all the time, it becomes more a matter of comparatively certain calculation as to the probable average life of existing mines. The life of the Calumet & Hecla is officially stated to be about 15 years. The mines of Butte are harder to estimate, but it is fairly safe to say that in the next 20 years most of them will be exhausted. The big controlling factor in the immediate future is the porphyry group, upon which fairly close estimates may be made. Taking the more important, those that will be factors in production in the next 10 years, they may be figured about as follows: Utah Copper, present tonnage, 150,000,000 tons; Nevada Consolidated, 40,000,000; Ray Consolidated, 80,000,000; Chino, 30,000,000; Inspiration, 20,000,000; Miami, 15,000,000; a total of 335,000,000 tons. Giving to these an additional hundred million tons to cover further develop-

ments and the entry into the producing ranks of such properties as Giroux, Mason Valley, and others, we have a total of about 435,000,000 to 450,000,000 tons of ore. In two years from the present time it is safe to say that the various properties in the porphyry group will be handling a total gross tonnage of 60,000 tons per day, which is equivalent to nearly 22,000,000 tons per annum. Simple division therefore fixes the life of the known important members of the porphyry group at approximately 20 years. Twenty years is a short period in the commercial life of the nation; the deplorable feature is the economic waste resulting from temporary overproduction. We are exporting 600,000,000 lb. of copper annually, all of which should bring 2 to 7c. more per pound than it does, and would do so, were it not for the prevailing abnormal conditions. Restriction of output in this view of the situation is more in the interest of the consumer than of the producer. The figures of the Director of the Mint covering precious metal production for 1910 are just published. The silver output in the United States was for the year, 56,438,695 oz., an increase over 1909 of 1,717,195 oz. The value of the production of gold fell below that of 1909, which was the record year, with an output of nearly $100,000,000. The United States, including Alaska, produced in gold in 1910, $96,055,214, a decrease of $3,618,186. Anent the production of gold, Thomas A. Edison has occasioned comment by a recently reported interview, in which he says that transmutation of base metals will yet be actually discovered; that any day may reveal the secret to busy searchers, and that the value of gold will tumble as a result.

The annual meeting of the Ray Central Copper Co. was held this week at Wilmington, Delaware. The important event was the anticipated publication of the report recently made by W. H. Weed and F. H. Probert. Following the announcement that not all of the ground had yet been proved, and that while the report had been made covering the work up to date, it was not complete and would not be given out until completed, the market was sold off sharply, evidently upon the theory that the report so far as made was not favorable and was withheld in the hope that the remaining portion yet to be made would help out the general average. Clyde A. Heller, secretary and treasurer of the Tonopah Belmont Development Co., and J. Harvey Whiteman, president of the Tonopah Mining Co., were elected directors of the Ray Central. A committee of members of the Boston Stock Exchange has been appointed to act for members of the exchange, who are besieged by clients for information and data concerning the Calumet & Hecla merger. The committee is to make a report as to whether or not the terms as proposed are fair and equitable. The action of this committee will be of especial interest to J. Parke Channing, who is supposed to have been the real appraiser of value, fixed in determining the various ratios of exchange. There has been some rumor to the effect that the merger plan was to be withdrawn, but this is emphatically denied. The Calumet & Hecla people are so far from feeling any weakness in the arrangement suggested that they are welcoming all investigation and extending every aid to stockholders or their representatives who wish to have details given them.

Pope Yeatman is to sail for Chile this week to examine the Braden Copper Co. plant, where operations are expected to begin soon. It is expected to mine a half million tons of ore this year, turning out about 15,000,000 lb. of copper, all of which will for the present be shipped to the Baltimore refinery. Later it is planned for the Braden to smelt and refine all of its own ores, which will be shipped direct to foreign markets and the output then will not figure as a part of the refinery product of the United States. Experiments are now in progress with a leaching plant, a one-fifth unit having been constructed; if the leaching process proves unsatisfactory an electrolytic refining plant will be substituted.

Goldfield Consolidated has been an active feature of the market in New York during the week by reason of the publication of J. R. Finlay's report. The controlling interests in Kerr Lake have seen a light. Heretofore it has been the invariable rule to allow no one not employed by the company to go underground on the property. No independent examinations have been permitted. Now, however, an examination has been made by Robert Livermore. Mr. Livermore says: "It is apparent that the Kerr Lake has at present some 10,000,000 oz. of silver in blocked ore; that it is positive ore as nearly as can be ascertained in ground of this nature; that there is still much ground unexplored in what I regard as a very favorable zone, lying along and under Kerr Lake from the present heading to the Drummond west boundaries; that this east drift has already opened bodies of ore, and that there is an area, as yet only slightly explored, larger in area than that already worked." Kerr Lake's underground workings aggregate something over three miles. Five branch banks have been established in Porcupine since the first of January and the Provincial Government of Ontario is to float a loan of $2,000,000 to build the branch of the Temiskaming & Northern Ontario railway into the camp. Another Canadian railway project which will run through the mining district of northern Ontario is to be taken up by the Quebec & Great Northwestern railway, which will apply for a charter to construct a road from Port Arthur to New Liskeard and Ottawa and from New Liskeard to Lake Abitibi, with a branch from Massinaibie to Michipicoten. The tonnage of the road is expected to come almost wholly from the mining district to be tapped.

TORONTO, CANADA

Initiative Taken to Revise Mining Code. — Little Money for Non-Dividend Paying Stocks.—Cobalt Mines.—Porcupine News.

The need of a uniform mining law for Canada has long been apparent, and the agitation, with that object, carried on by the Canadian Mining Institute has resulted in the matter being taken up by the Government. J. M. Clark, of Toronto, has been appointed to draft a mining bill, which it is hoped to have ready to submit to Parliament next spring. While the older provinces have jurisdiction over their own mining lands, the mineral resources of Manitoba, Alberta, Saskatchewan, the Yukon, and the unorganized territories are controlled by the Federal Government, which also has jurisdiction over the railway belt of British Columbia and some areas, especially Indian lands, in the other provinces. Hitherto all mining operations in the provinces and territories under Federal control have been regulated by orders-in-council passed by the administration to suit emergencies as they arose, the single exception being the Yukon Placer Mining Act. The result has been unsatisfactory, leading to a good deal of uncertainty and difficulty in ascertaining the requirements of the law, and the system, while defensible in a sparsely settled country where the mining interests were insignificant, is altogether inadequate in view of the progress of the mining industry in late years. It is hoped to secure a model mining code, to which end the Canadian Mining Institute is inviting suggestions. It is regarded as desirable to secure uniformity as far as possible between the provisions of the Federal mining law and the legislation of the older provinces, but that can only be done provided the latter are willing to make the necessary changes with such modifications as local conditions may render necessary.

The Porcupine boom is fairly launched so far as alluring prospectuses and brokers' entreaties to 'get in early' are concerned, but the public has so far not proved responsive to the extent anticipated, and the earlier flotations do not show any upward movement. It will require actual results, in dividends, to create an interest. There is little money available for speculation, owing to the conservative policy of the banks and the heavy losses sustained last year in Cobalt trading. Operations in Cobalt shares in 1910 show the market value of the stocks of 36 companies which were traded in to have depreciated to the extent of $11,000,000. Since the New Year the market has been quiet, with slight fluctuations.

General Mining News

ALASKA

The report of the Alaska United Gold M. Co. for the month ended December 15, 1910, is as follows: Mill time, 30 days. The Ready Bullion 120-stamp mill operated 29 days, 9 hr., 51 min.; water-power, 22 hr., 40 min.; steam-power, 28 days, 11 hr., 11 min. Ore crushed, 18,450 tons; concentrate saved, 352 tons. Estimated gross value of free gold, $19,701; estimated gross value of concentrate, $13,804.05. Total, $33,505.05; realizable value, $33,170. Operating expense, $30,876.04; net operating profit, 2293.96; construction, $1585.06. Yield per ton of ore milled, $1.81. Development, 465 ft., 289 ft. in ore, 89 ft. in waste. Stock of ore broken, 1212 tons. The 700 Ft. Claim 100-stamp mill operated 29 days, 13 hr., 9½ min.; water-power, 1 day, 9 hr., 4½ min.; steam-power, 28 days, 4 hr., 5 min. Ore crushed, 16,721 tons; concentrate saved, 272 tons. Estimated gross value of free gold, $20,287.58; estimated gross value of concentrate, $17,050.62. Total, $37,338.20; total realizable value, $36,964.82. Operating expense, $27,132.88; net operating profit, $9831.94. Construction, $2185.57; yield per ton of ore milled, $2.23. Development, 255 ft., 242 ft. in ore. Assay-value of ore, new development, $0.48 to $4.31 in Ready Bullion; in 700 Ft. Claim, $2.89 to $5.06. Stock of ore broken in latter, 11,538 tons.

ARIZONA

COCHISE COUNTY

The mines of the Tombstone Con. Mines Co., at Tombstone, are reported to have closed down for an indefinite period. The cause is found in the enormous expense entailed in pumping water from the mines. The ores are not high grade. The Mag shaft of the Calumet & Arizona, at Bisbee, has workings whereby 29,830 tons of oxidized ore is exposed, assaying 11.26% copper. This refers to orebodies in new territory. The Oliver mine of this company contains developed ore amounting to 647,000 tons, assaying 5.21% copper. These figures are from an official of the company.

GILA COUNTY

(Special Correspondence.)—The workings of the Miami Copper Co. are such that with a little more work the mine will be ready for production, and the concentrator will be finished in two weeks. It is estimated that when the mill starts about 400 tons per day will be hoisted from the main level, and 1600 tons daily will be taken from the stock-piles at No. 2 and No. 4 shafts. This stock accumulated in the course of development and blocking-out of the ore, and the preparation of the mine for production. When the mill is running at full capacity about 400 men will be employed on the surface and underground, as it is estimated that for every 1000 tons of ore mined it will require approximately 200 men, 25 on surface and 175 underground. The shipments of ore from the Warrior have been increased from 100 to 125 tons per day. Returns during the past month show that the ore has been running over 10% copper. It is expected that churn-drilling will be started soon on the property of the Arizona-Cananea company, the drills having been moved to the eastern end of the Montezuma group, adjoining the Live Oak. This property was formerly owned by the Boston-Miami company, and is situated west of the Miami townsite. The former owners did some churn-drilling in the southwestern part of the property. The annual meeting of the stockholders of the Arizona Michigan company will be held in Globe shortly to determine what further exploration work will be undertaken. It is expected that the station being cut at 1000-ft. depth in the McGaw shaft of the Superior & Boston Copper Co. will be completed by February 15. Then a cross-cut will be started west to cut the orebody that was found on the sixth level, and which is being opened on the eighth. The cross-cut being driven east toward the Iron lode is in 320 ft. Driving westward on the eighth level, along the Great Eastern vein, continues in rich ore that contains more copper glance than formerly. A raise is being made from the 800-ft. level at a place 425 ft. west of the McGaw shaft. Of the five churn-drills in use on the property of the Live Oak Development Co., four will be started on new holes, having drilled through the orebody. Drill-hole No. 44, which was started last week, is down 225 ft. in the surface capping. This hole is 1300 ft. south, and 2200 ft. west of the vertical shaft, and is in the most southwesterly hole that has been drilled on Live Oak ground. Hole No. 35, 300 ft. east and 500 ft. south of the shaft, was discontinued at 490 ft., the drill having gone through the orebody. In drill-hole No. 42, sunk 1300 ft. south of the shaft, the drill cut through 300 ft. of ore, striking the main orebody at 45 ft. Drilling was stopped in hole No. 43 at 510 ft., and in drill-hole No. 41 at 850 ft. The results in the latter two holes were satisfactory. With the exception of hole

Arizona.

No. 38, which was sunk to a depth of 900 ft., at which depth the drill was still in ore when drilling was stopped, hole No. 41 is the deepest that has been sunk in the Miami district. Ore was found in the latter at 580 ft. and continued to the 850-ft. mark, where drilling was discontinued. A force of 50 men is employed on the churn-drills, no mine development being undertaken at this time.

Globe, January 21.

GRAHAM COUNTY

Stockholders in the Arizona Copper Co., who reside at Clifton and vicinity, have petitioned the board of directors of that company to appoint James Colquhoun chairman of the board. Mr. Colquhoun was for many years the company's general manager. The mines are at Morenci and Metcalf; the smelter and two mills are at Clifton, with one mill at Morenci.

PINAL COUNTY

The Ray Consolidated, according to latest estimates, has 80,000,000 tons of ore developed, having an average copper content of 2.17%. The exploration was performed by 141,000 ft. of churn-drilling, and 45,000 ft. of development. The concentrating plant, under construction, is to have a capacity of 8000 tons of ore daily.

CALIFORNIA

GOLD OUTPUT

California took the lead at the close of 1910 in gold production, surpassing Colorado, which had held first place for several years. This State's output for 1910 is estimated at $21,146,150; that of Colorado at $20,577,942. The

figures showing the gold production of all the States and Territories were published in our issue of January 7.

OIL PRODUCTION

The oil production of California for December, and for the year 1910, is given below in district subdivisions, the figures being those of the *California Oil World*, of Bakersfield:

San Joaquin Valley:

Districts.	December (bbl.)	Output, 1910 (bbl.)
Coalinga	1,550,000	17,938,205
Kern River	1,018,300	13,789,272
Midway	1,167,605	10,498,006
Maricopa	427,177	8,749,047
McKittrick	514,600	5,431,936
Total	4,677,682	56,405,466

Southern Fields:

Districts.	December (bbl.)	Output, 1910 (bbl.)
Salt Lake-Sherman	240,000	3,228,262
Los Angeles City	36,000	453,330
Whittier-Coyotes	102,000	1,182,988
Fullerton, Puente & Brea.	410,000	5,018,720
Ventura County	41,000	491,842
Newhall	14,500	148,757
Total	843,500	10,623,899

Coast Fields:

Districts.	December (bbl.)	Output, 1910 (bbl.)
Santa Maria	585,000	7,750,423
Summerland	5,625	69,912
Total	590,625	7,820,335
Total, all districts	6,111,807	74,849,700

INYO COUNTY

The report of the Skidoo Mines Co. for December 1910 shows that the mill operated 20¼ days, treated 1155 tons of ore, from which was recovered bullion of the value of $19,517.75, and concentrate estimated at $375, making a production of $19,892.75 for the month. Operating costs were $7514.86; those of development, $817.41. Total expenditure, $8332.27; net profit for the month, $11,560.48.

MONO COUNTY

(Special Correspondence.)—At a meeting of the board of directors of the Standard Con. M. Co., held at Bodie on December 13, 1910, dividend No. 119, of 10c. per share, was declared, payable December 29.

Bodie, January 10.

SAN BENITO COUNTY

The New Idria Quicksilver Co., of San Francisco, operating the New Idria quicksilver mine, situated 12 miles from Hernandez, produces 800 to 900 flasks of quicksilver per month from a vein on the contact of serpentine and shale. This mine lies on the east side of the serpentine belt; while the Florence Mac, which has been partly developed by C. P. Smith and D. D. Hoag, lies on the west side. The latter property is on a similar contact. Other properties in that vicinity have veins in the serpentine.

TRINITY COUNTY

(Special Correspondence.)—The installation of the Bonanza King power plant, on the east fork of Trinity river, to replace the plant that was destroyed by fire more than a year ago, is completed, and power is now available for all purposes. No extensive operations are contemplated this winter. Most of the work will he done in adit No. 3, where a station has been cut and a hoist installed preparatory to sinking a winze on what is known to be a rich ore-shoot. The Poeth mine on Boulder creek has passed into the hands of the Gold Ridge M. & M. Co. It is the intention of the new management to install a three-drill air-compressor in the spring and begin sinking. Talbert Williams and Lester Yancey have taken a lease on the Meader mine, owned by Macliwaine & Bridge.

Carrville, January 20.

TUOLUMNE COUNTY

(Special Correspondence.)—The shoot of rich ore found in the Gianelli mine at Arastraville, four miles from Tuolumne, has been opened sufficiently to warrant the belief that the property will yield a fortune to its owners. The orebody, of fair size, is impregnated with gold throughout its length, the richest streak being estimated at hundreds of dollars per ton. The property adjoins the Duffield and is not far from the well known Dreisam. It is understood that work will be commenced at the Starr King mine, four miles east of Tuolumne, by those who lately have taken a bond on it. The shaft is 500 ft. deep, but no ore has been extracted below 350 ft., except that taken out in development, althongh the vein is opened on the two lower levels by 800 ft. of drifts. Sinking has been discontinued at the Black Oak and work is now confined to driving on the lowest level. Another rich shoot has been opened in the Soulsby mine. The mill continues operating on good ore. It is expected that the 10-stamp mill being installed at the Contention mine will be ready for operation by March 1. Most of the machinery has been delivered. C. F. Summers is superintendent. The Longfellow mill is again in operation on rich ore being taken from the shoot recently opened on the bottom level. Several men are employed at the Mulock mine, near Tuttletown, and prospects are reported to be encouraging. J. Whitney employs eight men at the Water Lily placer mine, near Reynold's Ferry. An adit is being driven to tap the gravel deposit. A prospect is being developed in the western part of the Basin district by R. Whipple, who has a 3-ft. vein, the ore in which assays from a few dollars to $100 per ton.

Tuolumne, January 21.

(Special Correspondence.)—The owners of the Dutch & Sweeney mines at Quartz have decided to add 20 stamps to their present 100-ton mill, and have purchased the equipment for this purpose. The old mill is in operation.

Quartz, January 20.

COLORADO

Vanadium ore was discovered in the mine of the General Vanadium Co., near Naturita, in Montrose county, in April 1910. Similar ore was found on the San Miguel river, near Sawpit. Ore shipped from the former property to Liverpool is said to have contained 3% metallic vanadium, and brought $60 per ton. A carload of ore mined at the latter property was shipped to the same market. In those properties the vanadium occurs as an impregnation of sandstone, and is designated as kentsmithite. The Primos Chemical Co. is mining roscoelite in San Miguel county, which is converted into ferro-vanadium in the leased mill at Newmire. The roscoelite is micaceous.

CLEAR CREEK COUNTY

(Special Correspondence.)—A shipment of 20 tons of ore made last week by Couverry & Co., leasing on the Capital mine, brought $1800 net. The Ohio claims, on Kelso, were sold by C. Howard and W. S. Hale to a party of Denver men for $25,000. Development is in progress. Mont Tong has taken a lease on a block of ground in the east drift of the Aetna vein owned by the Capital M. & T. Co. Stoping is being done on an 8-in. streak of $28 ore. Shipments will be started next week. W. P. Aikire, leasing on the Seven-Thirty mine, is shipping first-class ore that mills 420 oz. silver; his second class samples 180 oz. silver per ton. Mottschall & Co., leasing on the Pelican mine, have opened an 8-in. streak of galena that mills $52 per ton in silver and lead. Winters & Charles, leasing on the Gambetta mine, have 12 in. of zinc ore that mills without sorting 52% in that metal. Shipments are to begin next month. Stewart & Co., leasing on the East Griffith mine, are shipping galena ore, returns of $35 per ton being received.

Georgetown, January 20.

GILPIN COUNTY

(Special Correspondence.)—The Running Lode mine has been taken under a 10-year lease by a company composed of Denver and Silverton mining men. Ore shipments are being made from the Old Town mine, the principal part of the product being taken from the 600-ft. level. One carload recently shipped brought $125 per ton in gold, silver, and copper. An average of eight carloads per month is being shipped from the Chase mine at Russell Gulch, returns of $60 per ton being realized. Regular shipments of ore are made at the Cashier mine. A new shaft-house is being erected on the Gilpin-Orion property, and work has been resumed on the Federal Gold property in Moon gulch. Steady shipments are going out from the Kokomo mine. The ore mills $25 per ton.

Central City January 17.

LAKE COUNTY

The fissure veins of Leadville district are attracting much interest, and some deep-level exploration is going on to open a number of them. Burton, Thielen, and White are operating extensively on Fryer hill, having leases on the Hayden, Seneca, South Seneca, Anderson, and Pittsburg. The chief purpose of their prospecting work is to open bodies of zinc-carbonate ore. One feature of this work is the sinking of an incline winze from the bottom of the Anderson's 200-ft. shaft, with the expectation of opening a vein of zinc ore. The Silver Spoon shaft, Prospect mountain, is being repaired and supplied with new surface equipment. It has a depth of 350 ft., and as soon as everything is in working order, sinking is to be commenced. Lessees on the Climax, Fryer hill, have opened a body of lead ore, are prospecting for zinc ore, and have built ore-bins. John Nord and partners are shipping lead ore from the Stone shaft, Rock hill, on which they have a lease. J. Simpson and associates have driven 600 ft. on the Oro City claim, California gulch, and the heading of their adit is now in iron-silver ore; driving is to be continued into the Vining claim, on which they expect to open a vein.

SAN JUAN COUNTY

The ore shipped from San Juan county mines to the smelting plant of the A. S. & R. Co., during 1910, amounted to 33,528 tons, which yielded 16,429 oz. gold, 734,506 oz. silver, 7,201,950 lb. lead, and 1,070,880 lb. copper. The value of those products was as follows: gold, $339,578.43; silver, $392,740.36; lead, $323,367.56; copper, $135,252.14, making a total of $1,190,947.49. As an average, this tonnage of ore contained 1.59% copper, 10.88% lead, 21.9 oz. silver, and 0.49 oz. gold per ton. Practically all of it was sent to the Durango plant of this company. The smelting charge was $7.75 per ton. Small ore shipments were sent to the Salida smelter, the exact figures not being available.

SUMMIT COUNTY

(Special Correspondence.)—The Colorado-Toledo M. Co., with principal offices at Chicago, is opening the veins of ore in Collier mountain at depths of 1000 to 2200 ft. by driving a cross-cut adit, the heading of which is now in over 3000 ft. Several veins have been intersected, the driving on them aggregating about 1200 ft. The ore found contains silver, lead, and zinc. The expectation is to open other veins by extending the cross-cut. The mine is situated at Argentine. The mill being erected to concentrate this ore is expected to be in operation by next March, the initial capacity to be 100 tons per day. The 500-ton mill built at the St. John mine, at Montezuma, will not begin operating till next spring. The Automatic Transportation Co. of Buffalo, N. Y., is planning the construction of an electric railway from Keystone to various mines of Argentine and Montezuma.

Argentine, January 20.

The Wilson Mining Co. is operating its mine and mill at Robinson with a force of 150 men. The camp is close to the summit, between Leadville and Kokomo. The ore consists of heavy sulphide, and the work of the mill is to separate the metals of different specific gravity rather than to concentrate. Some equally interesting work has been performed in the mine. In making an incline raise from the lower workings of the Wilson toward the Felicia Grace, an idle property, the miners broke into a body of water in the latter's workings, and had to make their escape at once; two other drillers, in another part of the mine, were rescued by H. W. Shepherd, the superintendent, and as the three reached the shaft and gave the signal to hoist, the water was up to their shoulders. The pump-station of the Wilson was quickly submerged. The mine is to be unwatered, and in the meantime mining will be done on the levels above water.

TELLER COUNTY

A mill of 100 tons capacity is being constructed for the Ajax mine, Cripple Creek district, in which the Clancy cyanide process is being provided for. The Clancy method is controlled by the Moore Filter Co., and is usually installed in combination with the Moore slime process. The Gold Sovereign mine has been leased for three years to the Union Leasing Co. The Gold Dollar Consolidated M. Co. has installed a new hoist and air-compressor at its main shaft on Beacon hill, and sinking is to be resumed at the 650-ft. station. This is only one of the numerous mines in Cripple Creek district in which sinking is to keep pace with the receding water-level caused by drainage through the Roosevelt adit.

MONTANA

BROADWATER COUNTY

An explosion of powder on the 200-ft. level of the Keating mine at Radersburg, which occurred on January 18, resulted in the death of six miners and the serious injury of two others. Those who were working at the time below the 300-ft. level were not injured, and were taken out through another shaft. Those killed were Ed and Dan Ryan, Dan White, Percy Way, Louis Tucker, and Harry Abott; those injured, John Russell and Alex Westlake. William Walsh, State Mine Inspector, has made an investigation.

(Special Correspondence.)—The Blue Bird M. Co., operating in Radersburg district, will arrange to use electric power for hoisting and driving the air-compressor. The shaft, now at a depth of 200 ft., is to be sunk 300 ft. lower, and a cross-cut will then be driven to the ore from the 500-ft. station. By driving to the vein at 136-ft. depth a 6-ft. body of ore was opened, one foot of which sampled $32 per ton. The directors of the company are: P. F. and J. S. Bradshaw of Duluth; J. B. Foraker, Jr., of Cincinnati; and A. P. Nipgen and Barton Mitchell of Butte. The last 21 cars of ore shipped by the Keating Gold M. Co. to a Butte smelter returned $32 per ton, net, in gold and silver; besides, the iron content brought $2.50 per ton. The cost of mining, wagon-haul to Toston, railroad transportation, and treatment, amounts to a little over $10 per ton. Excellent ore is being mined on the 400 and 500-ft. levels.

Radersburg, January 20.

NEVADA

HUMBOLDT COUNTY

The National Mines Co. of National, paid a dividend of $120,000 on January 1, 1911, which makes $345,000 paid in the last six months. The number of men on the company's payroll is about 100. Most of the gold is recovered on amalgamating plates, although some concentrate is being hauled to the railroad for shipment to a smelter.

(Special Correspondence.)—A new shaft-house, 40 by 40 ft. in size, has been built at the Mazuma Hills mine by the Darby Gold Reduction Co., which is understood to have an option on the majority of the stock of the Mazuma Hills company. The Darby company is operating a mill at Mazuma by which the metals are extracted by amalgamation, concentration, and cyanidation. The properties are in Seven Troughs district.

Mazuma, January 20.

NYE COUNTY

(Special Correspondence.)—In Tonopah district, the finding of good ore is reported from the California, which lies

south of the Jim Butler. After a period of idleness it was taken on a bond and lease, three months ago. Its past history is that of the expenditure of a large sum for a limited amount of ore. Rapid progress is being made in driving the southeast drift on the 600-ft. level of the Jim Butler. Two shifts are employed, and the drift is a third of the way to the Stone Cabin fault, beyond which it will enter virgin territory on the company's ground. R. J. King is directing the work. The two large producers ended the year with increased net earnings for the last month; those of the Tonopah Mining Co. being $194,000, and those of the Belmont $155,000. The increase of the former was due mainly to the fact that the mill treated over 15,300 tons, or a monthly average of 153 tons per stamp. The increase in the Belmont was due chiefly to the cessation of construction work and the economy effected by the new surface plant. During January the Belmont has opened and mined high-grade ore in the stopes on the 1166-ft. level. Much of this ore contains bands of native silver, some of which are nearly half an inch thick.

Tonopah, January 20.

Ore production of the Tonopah mines for the week ended January 21 was as follows: Tonopah M. Co., 3650 tons; Belmont, 2000; Montana-Tonopah, 1018; Tonopah Extension, 980; West End, 325; MacNamara, 300 tons; total, 8273 tons.

WASHOE COUNTY

A vein of ore rich in silver was recently discovered at a depth of 150 ft. on the Grey Eagle claim in Olinghouse district. Previous to this, practically no silver ore had been found in that camp.

NEW MEXICO

SOCORRO COUNTY

(Special Correspondence.)—The seventh level has been established in the Socorro mine, and only a short cross-cut is necessary to be made to open the vein at this depth; and it is calculated that the vein will be cut on its dip by the shaft at 800 ft. The Ernestine M. Co. mined and milled 540 tons of ore for the week ended January 14, from which was extracted 6431 oz. of silver and gold bullion, and 46 sacks of concentrate. The mill at the Deadwood mines is ready to begin operating. This plant was built in 160 days, and the work included grading, laying foundations, hauling in of material, and installation of machinery, involving a wagon haul of 80 miles over a mountainous country.

Mogollon, January 18.

OREGON

BAKER COUNTY

(Special Correspondence.)—The Sumpter smelter, which has been idle since 1908 on account of the inability of the management to secure a sufficient tonnage of suitable ore to justify its operation, is now being overhauled and put in condition to operate. The management believes that enough ore will be available to justify it in 'blowing in' the plant by midsummer, and hopes for a sufficient supply to keep the smelter in continuous operation. The copper ores will come from the Seven Devils district, in Idaho, while the bulk of the product received will consist of the gold and silver ores and concentrates from eastern Oregon. The capacity of the plant is 150 tons daily. Since the closing of the Sumpter smelter, the ore product of the region, embracing eastern Oregon and western Idaho, has been purchased by the Oregon-Idaho Investment Co., which samples the same at its plant in Baker and re-ships to the smelter at Tacoma. The Imperial mine in Cable Cove district recently was taken over by Spokane capitalists who are now working a crew of 20 men on the property, under the management of W. A. Harvey. At the Dixie Meadows mine, which was purchased outright for cash a short time ago by L. Vogelstein & Co., work is in progress with a crew of 50 men. The Ben Harrison mine, in the Greenhorn district, which was purchased last fall by A. L. White and associates, of Lima, Ohio, has been operating since the property was transferred. W. C. Fellows, late of Kingman, Ariz., is in charge of the property and is accomplishing good results. A large amount of high-grade ore has been exposed since he took charge of the mine. He is driving a cross-cut about 600 ft. to tap the vein at a lower level. The Cougar mine, in Granite district, was examined by the United States S. R. & M. Co., and those in position to know, claim that a sale of the property is probable.

In Mormon Basin district the Rainbow and Humboldt mines are being developed on a large scale. This district will increase the production of its mines during the year by bringing in electric power, and by the installation of additional machinery. The Seven Devils district, in Idaho, is developing in a small way, and considerable copper ore is being taken out, so that good shipments are expected the coming summer. The Iron Dyke mine, on Snake river, is idle at present, but arrangements have been made to install a 200-ton concentrator on the mine next spring, when the property will be worked to its capacity. In the territory surrounding Baker, as a whole, the mining industry looks better now than at any time heretofore. This is due to the fact that the principal properties are being taken over by strong concerns, by which they are being developed and equipped.

Baker City, January 20.

JACKSON COUNTY

The Southern Oregon and Northern California Mining Congress met at Ashland on January 17. The State legislature of Oregon was asked to create and equip a mining bureau in the State Agricultural College at Corvallis. The delegates protested against the 'lease bills' now before Congress; also against the system of exacting fees from domestic and foreign corporations which have for their object the development of mines and other industries. The congress elected officers as follows: O. L. Young, Ashland, president; H. L. Herzinger, Grants Pass, vice-president; H. L. Andrews, Grants Pass, secretary; F. J. Newman, Medford, treasurer. The next session is to be held at Grants Pass on July 18, 1911.

UTAH

JUAB COUNTY

The shaft of the Yankee Con., near Eureka, was sunk from the 1300 to the 1400-ft. point by Kellogg & Scott, under contract. The sinking is to be continued to the depth of 1700 ft. Deep levels are to be established. The bottom of the shaft is now in dolomite. During the week ended January 14, the shipments of ore from the Grand Central mine, at Mammoth, amounted to 12 carloads. This ore was mined from stopes on and above the 2000 and 2100-ft. levels, where a new body of ore has been opened. The ore contains copper, accompanied by gold and silver. After operating the mine-pumps at full capacity for 60 days in the Centennial-Eureka shaft, the water has been lowered sufficiently to enable the operators to mine ore on the 2200-ft. level. By reducing the volume of water in this property, it is believed the water in adjacent mines will recede considerably. The Dragon shaft has reached a depth of 1065 ft. The ore-zone is to be opened by driving from the 800 and 1065-ft. stations. L. E. Riter is directing the work. The Chief Consolidated, at Eureka, has been equipped with a new double-drum hoisting engine, new steam boilers, capable of operating the two 3-deck cages to a depth of 2500 ft. Also, a new air-compressor is to be installed.

SUMMIT COUNTY

Free & Taylor, who are driving the Snake creek drainage tunnel to the Daly-Judge ground, in Park City district, advanced the heading 355 ft. between December 2 and January 2, and 13 shifts were lost in that time. At the latter date the heading was in 2423 feet.

(Special Correspondence.)—The Silver King Coalition Co. has purchased the property of the Uintah Treasure Hill for the sum of $100,000. Two 6% notes, each for $50,000, one payable January 1 and the other July 1, 1911, were given in payment. The two companies owned 12 claims jointly and the Uintah Treasure Hill had brought suit against the Silver King for extracting ore illegally from

the jointly-owned ground. In order to quiet title, the court had ordered a sale of the jointly-owned claims, but the two parties settled the matter as stated above. The Tintic Combination has been financed and work has been resumed. It is the intention to get electric power to the shaft, install electric equipment, and extend the workings that already exist. The shaft, which is in porphyry, will be sunk to the limestone. The South Utah treated 34,971 tons of ore during October and November, from which the yield was 2848 tons of concentrate averaging 10.5% copper. This is an average for the two months of less than 600 tons of ore per day, but the tonnage has been increased, and it was expected that the mill would be handling about 1000 tons per day after the first of the year. At Frisco the Horn Silver is remodeling its old mill and adding some new equipment, and the plant is expected to be ready for operation by the middle of January. It will have a capacity of 100 tons per day and is expected to save 75 to 80% of the value in the ore. The Utah Mine of Fish Springs has posted a dividend of 2c. per share. This mine paid small dividends regularly for a number of years, but ceased in February 1909. This was due to a large extent to the fact that the company was extending its holdings, but the dividends are expected to come regularly in the future. The report comes from the San Juan oilfields that the Standard Oil Co. has quietly bought a number of wells, done work on them, and capped them as soon as oil was struck. Also that a pipe-line has been surveyed by this company from those fields to Gallup, N. M. The Nephi Plaster Co. put off a successful large shot at its quarry at Nephi recently, and a hole 700 ft. long and 300 ft. wide opened, 15,000 tons of gypsum being loosened.

Park City, January 21.

CANADA

BRITISH COLUMBIA

(Special Correspondence.)—The agent for a syndicate of London investors has been negotiating to obtain a bond on the Queen mine, and has been to Marillan, Wisconsin, to consult with the owners. The 20-stamp mill on this property operated during the past year on ore averaging $12 per ton, treating nearly 13,000 tons, and making a good profit. If the deal goes through, at a high price for the mine and plant, the property will be worked on a much larger scale than heretofore. The owners of the McAllister mine, at Sandon, are shipping a small tonnage of ore and are figuring on plans to operate on a larger scale. Silver ore is being made ready for shipment by the lessees of the Sweetgrass, near Silverton. The Van Roi people have completed the tramway from the mine to the mill, and the work of installing the balance of the machinery in the mill will be undertaken. This is one of the leading silver-lead-zinc producers of the Silverton district. Shipments of ore from the California and Rambler-Cariboo mines continue. At the Utica mine a small force of men is stoping on a block of ore 100 ft. long and 25 ft. high. The operators may install a concentrator next spring. The owners of the Kootenay Belle mine, adjoining the Queen, have made final payment on their $90,000 bond. Arrangements are being made to mill a large tonnage during 1911. The Vancouver mine, Sheep Creek district, has been leased, and ore production will begin soon. The last few cars of ore shipped sampled $86.50 to $159 per ton.

The St. Eugene mine, Moyie, is now in charge of C. H. McDougall, who has planned much work for 1911. F. W. Guernsey, until recently in charge of the Consolidated properties at Williams, is in charge of the anthracite coal mines of the Canadian Pacific Railway Co. at Bankhead. Ore recently opened in the Society Girl mine, Moyie, is proving up well under development. Two cars of ore recently were shipped to the Trail smelter. In a recent article by your correspondent on the Consolidated company, the total production figures were included for the year 1910, instead of the figures for the fiscal year ended June 30, 1910. These figures should have been: Production for the Centre Star mines, 194,013 tons, at $9.90; the Snowshoe, 153,311 tons, at $5.60; St. Eugene, 140,000, at, say, $8.78; Sullivan, 5656 tons, at $20.96; Richmond Eureka, 3731 tons at $42.05; Queen Victoria, 778 tons at $9.94. It might be stated that in addition to the above tonnage 78,773 tons of custom ore was treated at Trail smelter; also 19,195 tons of concentrate from the St. Eugene mine.

Nelson, January 18.

(Special Correspondence.)—The Granby company has planned for heavy production during 1911. It is exploring with diamond-drills at the Phoenix mines. This company produced in November, 1,410,261 lb. of copper, containing 36,228 oz. silver and 2578 oz. gold. The six furnaces of its Grand Forks smelter are in blast. A fire at the Rawhide mine of the New Dominion Copper Co. destroyed the office and machine-shops, but has not interrupted ore shipments. The B. C. Copper Co. has resumed shipments of ore from its Oro Denoro mine. It is stated that the stock of this company will be placed on a dividend basis at the meeting of the directors to be held in New York this month. A dividend fund of $300,000 has accumulated. In November this company produced 917,994 lb. copper at its Greenwood smelter. This contained 2846 oz. gold, and 10,794 oz. silver. Net profits amounted to $35,221.

Granby Smelter, Greenwood.

Phoenix, January 20.

MEXICO

CHIHUAHUA

(Special Correspondence.)—El Rayo mine, situated 10 miles from Santa Barbara, is one of the properties of the Mines Company of America, and is under the management of James S. Colbath. The production since October 1907 amounted to $1,725,000, out of which dividends amounting to $85,385 were paid. Within that period a mill was built, and a large amount of development was performed. The Dolores, also a property of this company, is situated in the southwestern part of Chihuahua. Operations began there in 1905, and from that date to October 31, 1910, the gross production was $4,736,000, the dividends paid having amounted to $1,044,000.

Santa Barbara, January 10.

(Special Correspondence.)—La Republica Mining Co., operating at Sanz, out from Ocampo, in the month of December 1910 milled 1109 tons of ore, and extracted metals worth ₱73,210.94. The operating and development costs were ₱48,312.56, construction costs having amounted to ₱4583.60. J. Gordon Hardy is consulting engineer.

SONORA

(Special Correspondence.)—The Creston-Colorado mine, at Minas Prietas, which was acquired by the Mines Company of America in 1902, has produced ore valued at $9,299,000 from the date of its purchase to September 30, 1910, and has paid dividends amounting to $3,845,000 in that time. The same company owns La Dura mine, for which quarterly dividends are paid, the last one having been at the rate of 90c. per share.

Minas Prietas, January 18.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

GEORGE WINFIELD is ill in a hospital at San Francisco.

J. M. BOUTWELL resides at Santa Barbara, California.

F. M. HARRIS is on his way to Colombia, South America.

F. B. WEEKS is examining properties in Mariposa county, California.

J. NELSON NEVIUS is in San Francisco from mine examinations in Oregon.

W. H. HUTCHINGS is mine manager for the Ohio Mining Co., at Pearl, Idaho.

GEORGE E. FAAISH was in San Francisco and is now in southern California.

CLARENCE C. BOYDSTON is at the Casados mine, Hostotipaquillo, Jalisco, Mexico.

J. MORGAN CLEMENTS is in Arizona, having returned from the west coast of Mexico.

JOHN T. MILLIKEN, of the Golden Cycle mines of Cripple Creek, was recently in London.

H. A. JONES, superintendent for the Belmont Milling Co., at Millers, Nevada, is in San Francisco.

J. D. HUBBARD, a director of the Goldfield Consolidated mine, was at the St. Francis, San Francisco.

F. W. NOBS has resigned from the Santa Maria Mines, Ltd., at Minillas, Zacatecas, and is now at Leon, Nicaragua.

C. H. REPATH, chief engineer for the International Smelting & Refining Co., Utah, is visiting various places in Montana.

J. H. BAKER, a mining engineer of Courtland and San Francisco, was married on January 20 to Miss H. C. Whitehead, of London, England.

JOSEPH F. THORNE, until recently assistant manager, has succeeded J. R. FINLAY as manager for the Goldfield Consolidated Gold Mining Company.

WILLIAM R. JEWELL is making an inspection in the oilfields to obtain data from every company operating between and including Sunset and Coalinga, California.

FRED. SOLOMON, assistant superintendent of the concentrator of the Steptoe Valley Smelting & Mining Co., has gone on a tour of inspection of the various concentrators in Arizona, particularly the Miami plant.

OBITUARY

JOHN O. NORBOM, a mining engineer of Berkeley, California, was instantly killed on an Oakland ferryboat on the evening of January 13, by the explosion of some substance presumably carried in his pocket. The regrettable affair was of undoubted accidental origin. Mr. Norbom was operating a mine in Shasta county, and had had world-wide experience as a mining engineer. This untimely and strange ending of a useful life is regretted by his wide circle of acquaintance in the profession, all of whom will join us in extending their sympathy to his family.

HENRY JANIN died in London, January 6. He was one of the best known of the early California engineers. He graduated from Yale with his brother Louis, in the class of '58, and both took a post-graduate course at Freiberg. Henry Janin came to California in 1861 with his brother Louis, and both quickly took a prominent position in the mining world. Henry was for some time at the Enriquita quicksilver mine in Santa Clara county, of which Louis was manager. Later he had extensive experience in sliver mining in Mexico. He made money rapidly and gave up professional work to travel. He was closely associated with such men as Hamilton Smith, J. P. Morgan, J. B. Haggin, and others of the prominent mining engineers, mine owners, and financiers of his younger days, and financed a number of large mining propositions. In recent years he has made his home in London.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

SECOND LOCATION OF MINING CLAIM

A second or subsequent valid location of a mining claim in Idaho cannot be made on mineral land already covered by a valid location.

Flynn Groupe Mining Co. *v.* Murphy, (Idaho) 109 Pac. 851. June, 1910.

DEVISE OF UNDIVIDED INTEREST OF COAL LANDS—RIGHT TO PARTITION

Where a testator who owned an undivided interest in coal lands devised the same by will and blended his real and personal estate together for the purpose of distribution, his executors, and not the legatees under the will, were the proper parties to maintain partition against the owners of the other undivided interest.

Ramsey *v.* Ramsey, (Pa.) 75 Atlantic 421. Jan. 1910.

LIABILITY OF MINE OWNER FOR INJURY TO SERVANT OF INDEPENDENT CONTRACTOR

The owner of a mine who employed an independent contractor to work the same, but retained control over the operation of the hoisting apparatus, was held liable for an injury to a servant of such independent contractor, who was on the premises and in the position he occupied when injured, under an implied invitation from the owner and for a purpose connected with the business which the owner was not only engaged in but which he permitted to be there carried on. While there was no privity between the owner and the servant, and no contractual duty from the owner to the servant, yet there was a mutuality of interest between the servant of the independent contractor and the owner, and the law imposes upon the latter the duty to such servant to use due care to employ a reasonably qualified hoister to handle the hoisting apparatus.

Sloss-Sheffield Steel & Iron Co. *v.* Bibb, (Ala.) 51 Southern 545. Jan. 1910.

CONTRACT FOR SALE AND PURCHASE OF COAL

A written proposition from the owner of a coal mine to the president of a railroad company, suggesting the building by it of an 8-mile branch line from its road to his coal mines, he to receive a guarantee of tonnage of freight that would be satisfactory to the company, and an answer from the president of the company to the effect that the company would build the line for any parties who would furnish the right-of-way and put in a coal plant of not less than 1000 tons of coal per day, and would furnish the coal at the same price as that furnished by the Pocahontas people, and that the company would take from such persons at that price whatever amount of coal they would agree to furnish not less than 100,000 tons per year, or if they preferred to ship it themselves, the company would give them the same rate made to other parties. Thereupon the offer was accepted by the owner of the coal lands who stated that he would commence immediately to make leases and push his part of the contract with all promptness. And leases were accordingly made, the mines developed, the right-of-way for the road furnished and the branch road was built. The mines were operated by lessees who sold their coal to the company, but after a number of years it refused to receive any more of the coal. In an action to enforce the agreement it was held by the Federal Court that the correspondence created a contract for purchasing the coal, and was not merely a proposal on the part of the railroad company to negotiate future contracts, and that such contract construed in the light of the situation of the parties and the language of the letters, did not limit the company to take such coal as the land owner personally should mine, but included all coal that should be mined by lessees of such mine owner.

McKell *v.* Chesapeake, etc., R. Co., 175 Federal 321. Jan. 1910.

GOLDFIELD CONSOLIDATED FOR DECEMBER

The following figures showing the results of operation of the Goldfield Consolidated Mines for the month of December 1910, are submitted by J. R. Finlay, manager:

TONNAGE PRODUCED

	Dry Tons.	Average per Ton.
Combination	5,173	0.86
Mohawk	8,061	1.08
Red Top	3,607	1.42
Jumbo	8,709	2.05
Total	25,550	1.41

The gross value to be credited to the various mines is as follows:

Combination	$ 91,975
Mohawk	179,921
Red Top	105,865
Jumbo	369,000
Total	$746,761

The performance of the mill was as follows:

Dry tons milled	25,550
Average value per ton	$29.23
Total value	$746,761.00
Loss in tailing (actual mill tails)	43,339.00
Value realized	703,422.00
Percentage extracted	94.20

EXPENSES

		Amount.	Average per Ton.
General:			
Bullion tax and marketing bullion	$ 13,000		
Administration, etc.	21,000		
		$ 34,000	$ 1.33
Mining		95,000	3.72
Transportation		2,500	0.10
Milling:			
Milling and cyaniding	$60,740		
Marketing concentrate, residues, and by-products	6,971		
		$ 67,721	2.65
Construction		4,600	0.18
Net cost		$203,821	$ 7.98
Loss in tailing (actual mill tails)		43,339	1.70
Estimate for treating concentrate tailing dumped		10,893	0.42
Total costs and losses		$258,053	$10.10
Profit per ton			$19.13
Total value of ore per ton			$29.23
Total profit for month			$488,708
Percentage of profit			$65.44

It will be noted that the total costs and losses are lower than for any month in the past year. They will be lower still. It should also be noted that the grade of ore treated has been lower and that no high-grade ore was shipped to smelters. The lowering of the grade of ore is the principal factor in lowering the costs and losses, but there are other factors that are just beginning to have this effect.

The mill is steadily improving its extraction. The weather has been cold for the last half of the month. Cold weather has heretofore interfered with a thorough precipitation of the gold in the solutions; but the enlarged heating plant has obviated this difficulty and the precipitation has been excellent.

The company which has been operating the Grizzly Bear lease suspended operations at the close of the month. They have sunk a shaft 1200 ft. and explored to some extent on the 1160-ft. level, but without success. We are now taking over their operations on company account and will continue opening the 1160-ft. level without delay.

COMMERCIAL PARAGRAPHS

The Pelton Water Wheel Co. has moved its San Francisco office from 1093 Monadnock Bdg. to its works at 2229 Harrison street.

The A. Van Der Naillen School of Practical Engineering of Oakland, California, on the first of January entered upon its forty-seventh year.

Edgar Allen & Co. Ltd. Imperial Steel Works, Sheffield, England, whose chief American office and warehouse is at 434 West Randolph street, Chicago, announces that agency arrangements have just been completed with the following firms at whose warehouses large stocks of Allen's high speed and carbon tool steels will be carried: Roehm & Davison, Detroit, Michigan; J. L. Osgood, Erie County Bank building, Buffalo, New York; and John J. Greer & Co., Inc., 207 West Pratt street, Baltimore, Maryland.

George W. Myers, for many years the Pacific Coast representative of the Chrome Steel Works of Chrome, N. J., has again succeeded in closing on the two large annual contracts with the Alaska Treadwell Gold Mining Co. of Treadwell, Alaska, for their yearly requirements in shoes and stamp-mill parts, such as bossheads, cams, and tappets. The shoe award is the largest that is given by any company in North America, and this year's contract makes the eighth consecutive annual agreement secured by Mr. Myers for his company.

One of the strongest connections of kindred industries recently effected is that of the Ingersoll-Rand Co. and the A. S. Cameron Steam Pump Works, the former having purchased a controlling interest in the latter, yet the connection between these two companies can not be looked upon as a merger in any sense of the word. The A. S. Cameron Steam Pump Works will continue under the management of George W. Fuller as in the past, and there will be no change in the policy of the company, but a greater expansion is contemplated. Mr. Fuller has been associated with the Cameron for many years, entering its employ in 1883 as office manager and entrusted with its general management in 1899. With improved and increased facilities for manufacture, and the advantage of the large and splendidly equipped selling force of the Ingersoll-Rand Co., it is predicted that the business will develop to still larger proportions.

The Stephens-Adamson Mfg. Co., of Aurora, Illinois, has recently strengthened its organization by securing the services of G. H. Stephens. Mr. Stephens has obtained substantial interests in this company, and will assume at once the management of the Eastern business. The Eastern office is located at 50 Church street, New York City. Mr. Stephens has been a prominent factor in the conveying industry for over twenty years. The engineering department of the Stephens-Adamson Mfg. Co.'s New York office is under the charge of J. G. Marcrum, who was formerly associated with Mr. Stephens in business and is recognized as a conveying engineer of unusual ability. Earl D. Stearns, who has ably represented the Stephens-Adamson company in the East for the past two years, will henceforth take charge of the company's Chicago office in the First National Bank building. The Stephens-Adamson Mfg. Co. manufactures a complete line of conveying, elevating, screening, and power transmitting machinery. Its main office and shops are at Aurora, Illinois, on the main line of the Burlington. These shops are thoroughly modern in every respect, and the company is prepared to design and manufacture a high grade of machinery in the least time and in the most efficient manner. Its new steel shop, which has just been completed, is one of the largest and most finely equipped for this purpose in the country.

Smith, Emery & Co., engineers and chemists, announce the completion of a reorganization of their business, made necessary by its rapid growth and development. The capital stock has been increased to $100,000, and the latest bookkeeping and filing systems are being installed. The Los Angeles establishment, which has hitherto been a separate corporation, under the name of Smith-Emery Co., now becomes a part of Smith, Emery & Co., the parent organization. The personnel of the directing forces of the firm are now A. L. Emery, president; Emory E. Smith, vice-president and general manager; E. O. Slater, second vice-president and manager, Los Angeles; M. T. MacDonald, secretary; B. R. Putnam, treasurer and manager mining department; W. C. Bass, manager mining department, Los Angeles; Duncan Anderson, chief chemist; Frank Riordan, superintendent cement department; and A. E. Roberts, designing engineer. The laboratories and offices of the company occupy the building at 651-3 Howard street, San Francisco, and the Los Angeles branch occupies the building, owned by the company, at 245 South Los Angeles street, in that city. The firm has at present on its regular staff twenty-two engineers, chemists, and assistants, and a staff of six associate engineers, and has extensive Eastern, Canadian, and European connections. This firm is playing an important part in the development of the large construction and manufacturing business of the State.

CATALOGUES RECEIVED

Sutton, Steele & Steele, Inc., Dallas, Texas. Bulletin T4. 'Dry Concentrating Tables.' Illustrated. 6 pages. 6 by 9½ inches.

Colorado Iron Works Co., Denver. Pamphlet No. 28. 'The Portland Continuous Filter.' Illustrated. 8 pages. 6 by 9 inches.

The Bristol Co., Waterbury, Connecticut. Bulletin No. 130. 'Wm. H. Bristol Electric Pyrometers.' Illustrated. 56 pages. 8 by 10½ inches.

The Braeckel Concentrator Co., Joplin, Mo. 'The Dunham Concentrator.' A description of this well known table. Illustrated. 24 pages. 9 by 6 inches.

Dean Bros. Steam Pump Works, Indianapolis, Indiana. Catalogue No. 83. 'Special Boiler Feeders on Pressure Pumps.' Illustrated. 28 pages. 6 by 7¼ inches.

W. & L. E. Gurley, Troy, N. Y. 'Gurley's Manual.' Forty-fifth edition. This complete volume is out in a more attractive form than ever, and its usefulness is too well known to need comment. Illustrated with beautiful three-color halftones. 516 pages. 4½ by 6½ inches.

Ingersoll-Rand Co., New York. Bulletin No. 3007. 'Class "PB" Duplex Power Driven Air Compressors.' Illustrated. 24 pages. 6 by 9 inches. Bulletin No. 5003. 'Radialaxe Air-Driven Coal Cutters.' Illustrated. 20 pages. 6 by 9 inches. Bulletin No. 9008. 'Pneumatic Tamping Machines.' Illustrated. 12 pages. 6 by 9 inches.

The Jeffrey Mfg. Co., Columbus, Ohio. Catalogue No. 26A. 'Mine Fans.' A handsome catalogue showing centrifugal fans for mine ventilation and numerous photographs showing installations where Jeffrey fans are in use. Several pages of engineering data and formulas of interest to those having ventilating problems under consideration are included. Illustrated. 36 pages. 6 by 9 inches.

Chas. C. Moore & Co. Engineers Pacific Coast representatives announce the following catalogues: 'Air Compressors,' catalogue 549 of the Piatt Iron Works, Dayton, Ohio; 'General Service Pumps,' catalogue 555 of the Platt Iron Works, Dayton, Ohio; 'Power Pumps,' catalogue No. 115 of the Hoover, Owens Reutschler Co., Hamilton, Ohio; 'Boiler Tube Cleaners,' catalogue L of the Lagonda Mfg. Co., Springfield, Ohio.

A NEW FINE-GRINDING MILL

The Marathon mill is advanced by the Johnson Engineering Works, First National Bank building, Chicago, as a fine-grinding device which successfully solves most of the difficulties in present practice. It consists of a tube or ball-mill in which the grinders are longitudinal iron rods. The fineness of the discharge and the capacity may be varied by tilting the whole mill about a transverse axis. A few minor alterations change the mill from dry to wet grinding. The makers claim to be able to reduce ore from a crusher to a 200-mesh product in one operation with very small expenditure of power.

TABLE OF CONTENTS

EDITORIAL

BASIC copper ores are in demand where they can be delivered at low cost at Pacific coast tidewater. Southeastern Alaska affords a promising field in this connection.

MEXICAN political troubles are apparently becoming more serious in Chihuahua and the north central States. So far, quiet has prevailed in the West Coast cities and towns, but much unrest is reported in the mountain villages and there has been trouble along the Arizona border.

ENGINEERS have read with much pleasure the report of the board of army engineers that has been studying the work of the Reclamation Service. The tone of the report is highly and deservedly commendatory, and Mr. F. H. Newell, the director, and his associates, may well feel complimented. In his attacks on the Reclamation Service the Secretary of the Interior has not represented the better sentiment of the country, and he has done much harm to a great clean branch of the public service.

NATOMAS No. 8, the first of the 16-cubic foot dredges of the Natomas Consolidated, has begun work at Folsom, California. It is an excellent boat and is expected to break records. By contrast the early Oroville boats look like toys, and yet dredge builders are already planning for larger capacity. Indeed, Mr. Newton Cleaveland, of the Yuba Construction Company, confesses privately to ambitions for a 27-cubic foot boat, and we hope sometime to print the account of the launching and operation of such a monster.

IT has long been the dream of the American Institute of Mining Engineers to visit Japan. But, like many individuals who have entertained similar dreams, the carrying out of a plan involving so great an expenditure of time, has had to be postponed until its execution appeared unlikely. The forthcoming autumn meeting of the Institute will be held in San Francisco, a natural point of departure for the more extended trip, and it is probable that an excursion to Japan, with a three weeks stay in Nippon, will be one of the chief features of the meeting. Fortunately the most important mines in Japan are near places of scenic interest, so that even so brief a visit will suffice for a very comprehensive view of the land of the cherry blossom and chrysanthemum. Plans for the excursion are necessarily only tentative as yet, but a definite announcement will be made in time for members to arrange plans for visiting a country so full of interest to all Americans.

TIN at its present high price is stimulating the owners of tin prospects and mines to renewed endeavor to put their properties on a working basis. Unusual activity is noticeable in the tin camps of the Black Hills of South Dakota, both in the Bear Gulch and the Harney Peak districts. A great deal of development has been done and much money spent in the experimental concentration of the ores which occur in pegmatite veins. It is now claimed that the problem has been satisfactorily solved, which we sincerely hope to be the case.

WARNING is issued by the Chamber of Mines and Oil of Los Angeles against a man named Williams who has been selling fake specimens to the unsuspecting. He is rather heavily set, has blue eyes, light sandy hair, a pallid look, and he walks with a limp. He has the general appearance of having either been seriously ill or confined in prison. He claims that the specimens offered for sale are high-grade sylvanite from Cripple Creek, Colorado. The ore has the appearance of having been roasted and is covered with small globules of supposed gold. Cutting these globules and examining them under a glass shows that they are false, and an assay will show that their gold content amounts to nothing.

GOOD news comes from the Comstock, where the work done by Mr. Whitman Symmes in developing the deep levels of these old mines, seems now likely to bear fruit. In the Mexican ground far east of any of the old workings of either that mine or the Ophir, a body of ore 10 feet wide has been found on the 2500-foot level, 700 feet below any ore above. The new orebody is a breccia of quartz cemented by metallic sulphides of lead, zinc, and iron, and is similar in character to that of the old Consolidated Virginia bonanza. Last week 15 cars averaged $44.41 per ton in value, about half gold, and later tests yield $65 per ton. The vein is well defined, but naturally the extent of the orebody is not yet known. While it may be only small, it at least indicates the probability of rich ore being present in these lower levels.

NEGOTIATIONS for the sale of the Golden Cycle mine and mill at Cripple Creek to the Consolidated Gold Fields of South Africa have been concluded, we understand, and formal announcement of the change of ownership will be made soon. The entry of this well known company into the Cripple Creek district has a double interest, derived from the importance of the two companies concerned. The Consolidated Gold Fields of South Africa is the largest of the African gold mining corporations, and is perhaps best known in America for its important holdings in the United States Smelting, Refining & Mining Company, Oroville Dredging, and Yuba Consolidated. The Golden Cycle mine is known as an important producer and the mill at Colorado City has many features of interest. With a capacity of 1000 tons per day, it treats more than half of the custom ore of the district as well as that from its own mine, with conspicuous success. When the mill was totally destroyed by fire in 1907, Mr. John T. Milliken, then the superintendent, began treating ore again within one hundred days, and after a very brief period the mill was in full operation. We congratulate the Consolidated Gold Fields upon the addition to its American holdings.

Goldfield Consolidated

Nevada's premier gold mine has been much in the public eye since the first of the year. We published last week an abstract from the manager's report for December, and in this issue we give the bulk of Mr. J. R. Finlay's report for the fiscal year, made public January 9. It is unnecessary to go into details, as excellent monthly reports issued through the year have kept everyone informed who cared to know. The Goldfield is a great, a truly phenomenal, mine, and it has been managed with unusual success and skill under conditions, many of which are adverse. Yet the stock has never sold at a high price when measured, as are other stocks, against current dividends, and has dropped recently from $8.45 per share at the end of December to $6.55 at the end of January. Shortly after the annual meeting Mr. Finlay resigned and there has been much speculation as to why stock paying 30 per cent dividends, at current price, should be available for purchase in any amount. The price naturally reflects the judgment of the public as to its value, but one important factor is that there is so much of the stock. There have been issued 3,559,148 shares of a par value of $10 each; a truly remarkable capitalization for a young mining corporation dependent practically on a single, though large, mine. In the second place, both the president of the company, Mr. George Wingfield, and the general manager, Mr. J. R. Finlay, state frankly in their reports that the four extra dividends of twenty cents per share came from sale of rich ore and that the continuance of such dividends is uncertain. There is also no attempt to disguise the facts that the orebody is exceedingly irregular, that differences between rich ore and barren rock are sharp, and that the property is not one where it is wise to block out large reserves in advance of stoping. Mr. Finlay's remarks on the subject of ore reserves are particularly illuminating, and stockholders in the enterprise must expect sudden and disquieting changes in the amount of ore in sight. Exploration on upper levels near and under the old stopes of lessees may be expected, for some time at least, to develop ore rapidly and cheaply. Less is known about ore-shoots at lower levels, though high-grade ore is present in quantity. Naturally, prospecting at these levels is less certain, though equally necessary, and it may not be always possible to keep the balance even. Development in 1910 was unusual, in that an actual profit was realized from the ore won in the mere process of driving drifts, winzes, and raises. The total development cost $379,493 and yielded 41,896 ounces of gold. Apparently, too, the work of the year brought much ore into sight, though the December report alone was discouraging in that regard. These unusual conditions furnish sufficient

reasons for rapid variations in the price of the stock, but there is another and more fundamental one. The management has not yet won the confidence of the general buying public, though many steps have been taken to establish that confidence. The largest holding of stock is that of Mr. George Wingfield, amounting, according to the last published account, to 461,202 shares. He and his friends naturally dominate the company. The second largest holding is that of Mr. Thomas D. Jones of Chicago, amounting to 100,000 shares, his brother, Mr. David B. Jones, having in addition 53,700. Probably the third largest interest is that represented by the 73,550 shares scattered among a half-dozen persons, all receiving their dividends through the Crocker National Bank, in San Francisco. Mr. M. J. Johnson of New York holds 71,000 shares, Mr. Arthur Winslow, 22,700, the Untermeyers, 38,000, and in all there are over 5000 shareholders. The list includes many excellent names, but evidently many of the best known stockholders take little part in the management of the property. With so many uncertainties inherent in the situation, it is not surprising that Eastern investors are slow to buy stock in a heavy capitalized concern paying abnormal dividends, and dominated by a man not already favorably known to them. It will take time, even with the excellent policy of frank statement that the Goldfield Consolidated management has adopted, to win the confidence already held, for example, by the Tonopah Mining Company and the Camp Bird Limited.

Vulcan Copper Mine

New and remarkable light has been thrown on the geology of Shasta county, California, by a 'Geological Report of the Vulcan Mine,' by Alexander Roy, "Geologist." Just how remarkable his conclusions are may be best shown by a quotation or two.

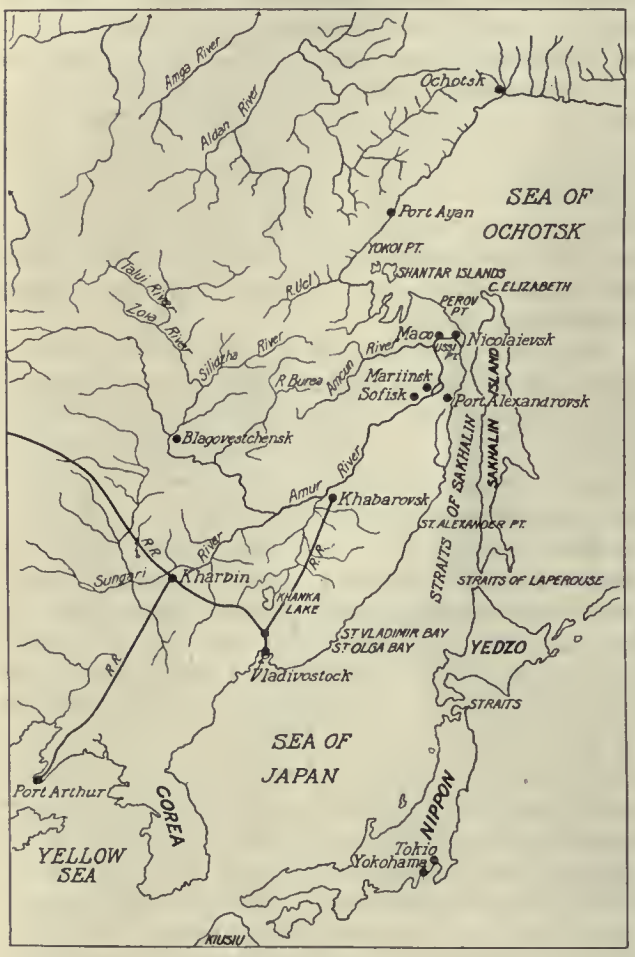
Following a lurid description of the Archean, Mr. Roy says: "When the earth was sufficiently cooled to precipitate the vapors as water, and formed an ocean above these formations, the copper solution, because of its greater density, formed a layer above this formation and percolated through the small fissures leading to it, and filled the basins, thus being primary deposition. The other salts, such as iron sulphides, etc., because of their density, also partly filled this great fissure, and together they formed the copper beds of Shasta county, in this neighborhood. Above this, and caused by their ability to remain in solution for a longer period of years, was eventually crystallized out of the solution, a weaker form of basalt, which here formed the Cambrian era. The deposition of the copper solution followed this age. The movements of these rocks on each other formed a sediment of basalt and andesite, which make the bed of conglomerate, which I have marked Ordovician ocean bed. Above this a similar occurrence took place over the Cambrian, which formed another bed above it," and so the story is continued up to the Devonian, which "is as high in the order of eras as the folds on the Vulcan properties ascend." There is geology for you! No wonder that the author feels the need at about this point of a heading, **REMARKABLE GEOLOGICAL PHENOMENA**—nothing less would be adequately descriptive. Following it, he says: "The folds at the widest are not more than 200 feet in thickness, with the exception of the Devonian, so that one gets in Vulcan Ground a point for reading these great ages which exposes them seriatum in a manner not found elsewhere in America." We believe this to be a conservative statement. It is doubtful whether "these great ages" could be read in this manners elsewhere in America or anywhere in the world. Enough has been quoted, however, to show what a mere string of misunderstood and misused words this 'report' is, yet it is being circulated in sober earnest in an effort to raise money for developing copper mines. With it is distributed an elaborate sheet of reproductions of commendatory letters from various persons who have visited the property or own shares in the enterprise, and who seem to make up in faith what they may lack in skill and experience in estimating a mine. These features naturally condemn the venture to any experienced investor, and yet a bad report or unwise methods of flotation do not necessarily condemn a property.

The holdings of the Vulcan Copper Mining Company are in Shasta county, California, adjacent to those of the Balaklala Consolidated and the Trinity. They lie within the area that is legitimate territory for prospecting for copper. We know of no reason why the claims may not prove rich in copper; there is some evidence that they may. It is, however, a matter to be determined by careful, intelligent work with the drill and by underground exploration. If any large body of valuable ore has yet been found, it is not shown by the documents made public. The circulation of such as have been given out casts doubt on the business judgment at least, of those directing the venture; and good judgment is as essential to developing a successful mining enterprise as is integrity. While we fear there is small hope for profit to one buying these shares, there are certain features of the prospectus worthy of being copied in those issued by more ambitious concerns. The statements for which the company assumes responsibility are carefully discriminated and expressed clearly, the plans for selling stock and for using the resulting funds are detailed, and the exact amount allotted to the promoters in return for the property is frankly stated. There is, however, no apparent provision against promoters' stock being dumped on the market, and the shares are not under-written, nor is working capital guaranteed by any responsible financial concern. Profit to each buyer of the stock is therefore contingent upon the promoters' success in raising all the capital required, as well as on the ordinary and natural risks incident to finding ore and conducting the business. The whole set of documents brings out sharply once more the difference between the possibility or even probability of the presence of ore in a given piece of ground, and any reasonable certainty of a buyer of shares realizing a profit.

Sluicing at the Kolchan Mines, East Siberia—I

By Chester W. Purington

***Situation and Character.**—In the year 1907 I left London for the purpose of a general inspection of conditions in East Siberia, and partieularly to examine the gold placer mining property, now known as the Kolehan property, belonging to the Oehotsk Gold Mining Co., situated near the mouth of the Amur river. The route traveled was as follows: Leaving rail head at Habarovsk on the Amur river, my party proeeeded by steamer 600 miles down the



Eastern Siberia.

Amur, through a country of magnifieent forests, wild and unpeopled, exeept as the sparse fishing villages of mingled Russians, Chinese, and Giliaks occasionally broke the wilderness. Two days saw us at Nikolaievsk, the prineipal supply point near the mouth of the Amur. Good stores, notably of the important Siberian firm of Churin, a Government assay and receiving offiee for the local gold from the Oehotsk and Amgoon mines, the steel barges and steamers of the Amur navigation companies, a transient fishing and mining population of ten thousand, an electric lighting plant, and a telegraph office represent the progressive elements of this frontier community. One hundred Japanese fishing sehoon-

*The rouble, which is used in this article, is equivalent to $0.515; the kopeck is one-hundredth part of one rouble.

ers from Hakodate, refrigerator steamers from England, mail steamers from Vladivostok, and trading boats from Hamburg lie at anehor in the river, off the town. One hundred million pounds of salmon is annually taken in the Amur, between Nikolaievsk and the Straits of Tartary, 25 miles below. The eargoes depart for Japan and Europe, and the fishing population leaves in late Oetober, in the river and sea steamers.

I was impressed with the fact that here the 'dark eontinent' of Siberia has a window open to the world. A eountry of magnifieent wealth in timber, in animal produets, and in gold lies behind, and before is the open sea.

One day's journey northwest from Nikolaievsk lies the extensive gold mining property known as the Oehotsk, or more reeently the Kolehan. This property is at 53° 30′ north latitude, or almost that of the city of Liverpool, England. Six hundred thousand pounds sterling in alluvial gold dust was taken from three miles of the Stretensky elaim in a

Nikolaievsk Mining Region.

creek bed, known by the Giliaks as the Kolehan, by a Russian company between the years 1898 and 1906. The work went on in the old Russian way, by extremely primitive and expensive methods, as is proved by the faet that in 1907 the company mortgaged its property to the Russo-Chinese Bank, which formed a reeeivership to carry on the mining operations. At about this time, June 1907, I visited the property, and althongh I fonnd the area too extensive to be sampled as a whole by myself and J. B. Landfield, my assistant, in a single season, the possibilities for gold dredging impressed me so that I undertook to sample a portion of it in detail. One hundred and sixteen pits from 10 to 25 ft. deep were sunk under my direction during ten weeks' stay on the property, and about 300 cu. yd. of gravel from fifty additional cuts and trenehes were washed in sluiee-boxes. As a result I established the presenee, in the small portion of the property which I was able to thoroughly examine, of five million cubie yards of gravel earrying a recoverable gross value of 80 kopeeks per cubie yard. About 200 acres of the bottom land along the stream were sampled in

1907, and 3000 acres, containing approximately 20,000 cu. yd. per acre, remain to be sampled.

The remarkably high tenor of the Upper Kolchan tailing and fresh gravel, namely 80 kopecks, is an indication that the great areas of gravel lying between the lower end of the Stretensky claim and the sea, carry gold. The fact that the alluvial gold, in shot-like and not flat particles, extends to the sea, and is present in the beach sand, has been determined. As the flats or meadows lying adjacent to the sea are all gravel and consist of the White mountain float, and as gold is found in every case where surface gravel is visible, it is justifiable to assume that further sampling will prove a certain proportion of the area profitable for dredging. As a proof that dredgeable gold exists in the lower meadows, may be cited the fact that pit No. 3092, one of the lowest line sunk on the Kolchan in 1907, four miles below the lowest limit of the positive reserves, showed a value of 90 kopecks per cubic yard in fine rounded gold.

The main physical features of the area are as follows:

1. Owing to processes of erosion, White mountain, a peak of gold-bearing volcanic rock, possibly itself an extinct volcano, had been nearly worn away.

2. Its débris in the shape of rhyolite fragments had been distributed to the north toward the ocean shore, over an area of fifteen to twenty square miles.

3. Wherever the previous configuration of the country allowed this débris to accumulate, it was invariably accompanied by residual gold in a fine and rounded condition.

4. Owing to the peculiar nature of the original gold deposit, the particles were never flat and were never large, but the gold for the most part occurred in the form of a clean powder, of which every piece, however small in size, had three dimensions; this, by the way, is unusual in gold-dredging areas, as in California and elsewhere the gold is of so flaky a character that some of it floats on water; moreover, I determined that the gold of the Kolchan river easily amalgamates, and there is rarely a particle of it which is not attacked by quicksilver. Coarse nuggets never occur, and pieces of pure gold weighing more than one-tenth of an ounce are seldom, if ever, found.

5. As a further result of the wide distribution of the rhyolite gravel the material is extremely small and well rounded; in fact, at a distance of four miles or more away from the source it resembles small eggs or beach pebbles. Although the excessive amount of alumina liberated by the decomposition of the rhyolite causes some clay layers to form on the slopes of the mountain itself, this also, at a distance of three miles from the mountain, almost entirely disappears, and the gravel becomes as free and loose as on the sea beach itself. This remarkable

Cutting Into the Bank.

Dumping the Bucket.

character continues over the level gravel flats for a length of ten and a width of one-half mile to three miles.

6. The depth of this gravel sheet, lying between the White mountain and the sea, is also extremely regular. As far as the lowest line of pits previously referred to, some seven miles to the north of the White mountain, the depth does not exceed 18 ft. So far it has been impossible to sink pits farther north than this for lack of time and money assigned to prospecting alone, but I am confident that drilling will substantiate the fact that none of the ground exceeds 25 ft. in depth to bedrock, even as far as the sea beach itself.

7. Although at a latitude of 53° 30′ N., and in a region where extreme winter cold occurs, yet the gravel is not frozen to an extent which will cause difficulties. No permanent frost has been noted at a distance greater than one-half mile to the south of the actual beach, but annual frost penetrates the ground to the depth of the turf or peat overburden; this frost is said not to penetrate the underlying gravel, and my own experience in hand-shoveling bears out this assertion. The annual frost does not leave the ground sometimes until the middle of July, and is occasionally a detriment to hand operations. Recent dredging experience in the Klondike and near Cape Nome, however, shows that such a comparatively small amount of frost will have practically no effect in delaying the operations of dredges.

Operations of the First Two Years.—In 1908 a so-called 'staratel' or 'tributer' arrangement was made with the local Russian manager. By this I was permitted to have a share in the gold which was being taken from the property by 1000 tributers, Chinese and Koreans. I was also allowed to work a small block of ground, about a quarter of an acre in extent, for myself, paying a very high royalty of 33% to the Russian company. In a period of 40 days, nearly £4000 was received from the Chinese operations and my own string of sluice-boxes. Actually, without the help of the tributers' gold, I obtained the sum of 14,500 Rs., roughly £1500, from 2000 cu. yd. of material. This work was done by hand-shoveling without the use of machinery, except a small centrifugal pump which raised water about 10 ft. Everything on the property was in poor shape for work, and it was even necessary to make wheels for the wheel-

Map of Kolchan Mines.

barrows, used for transferring the gravel to the sluice. The operations of 1909 resulted in returns of 126,441 Rs., for a season extending from July 26 to September 30.

The relative depth of the deepest mines as compared with the diameter of the earth may be appreciated by stacking up 8000 sheets of paper; one of these to represent a mile, the approximate depth of the deepest mine shafts. It will at once be seen that the deepest mines and bore-holes are but mere pin-prieks and the highest mountains only a slight roughening of the surface. The coating of varnish on a 2-ft. globe representing the earth is relatively thicker than the deepest ocean.

Employment of inexperienced immigrants in the coal mines of this country is suggested as the probable cause of many serious accidents, in a report of the Immigration Commission. The report deals with the economic condition of about 88,000 soft-coal miners. Of the 88,000 men, 54,000 were foreign born, and nearly 40% had been in this country less than five years.

Goldfield Consolidated

By J. R. Finlay

*Production, expenses, and profits for the year may be summarized as below:

PRODUCTION

			Per ton.
265,352	tons milled	$9,842,122.84	
1,515	tons shipped	1,024,629.61	
266,867	tons total product	$10,866,752.45	$40.72
	Loss in tailing	592,818.28	2.22
	Amount realized	$10,273,934.17	$38.50

EXPENSES

Mining:			
Stoping	$652,565.67		
Development	379,492.91		
	$1,032,058.58		$3.86
Transportation	36,799.51		0.14
Milling	562,881.07		2.11

Shipping ore	1,515	676.05	1,024,629		
Total	266,867	$10.72	$10,866,752		

At the beginning of the fiscal year J. H. Mackenzie, then general manager, had under way an addition to the new 100-stamp mill designed to increase its capacity about 30%, or, in other words, to make up doubly the loss of capacity caused by the dismantling of the old Combination 20-stamp mill. This improvement was not completed until the end of December, so that the maximum treatment capacity for the last two months of 1909 was 20,000 tons, while, beginning with January 1910, the capacity was 25,000 tons for the month, and the tonnage for the year was expected to be 290,000. There was, however, a serious interruption for the three months of April, May, and June, caused by a bad fire on the night of April 8. This fire at first appeared to be more disastrous than it afterward proved, for it seemed almost certain that the Merrill precipitating presses in the refinery were destroyed. Had this been the case, the entire plant would have been shut down for at least two months. It proved, however, that the presses were intact, and the mill was started with 70 stamps after a shut-down of seven days. The 30 stamps and a portion of the ore-bins and the inclined belt conveyor, all of which had been destroyed, were replaced by July 1. This accident cost $156,446.50 in supplies and reconstruction, besides diminishing the ore milled for the year by 25,000 tons.

Comparison with last year's report will show that there has been no decrease of operating costs coincident with increased tonnage at the 100-stamp mill. This is accounted for wholly by increased cyanide consumption, caused by the constantly diminishing proportion of oxidized ores and increase of sulphides from the lower levels. Leaving this factor out of consideration, the plant has worked exceedingly well. In crushing efficiency, cost of operating, and recovery of gold, it has fully met all expectations. Mining costs have tended to diminish during the year. The highest month was November 1909, when the mining and development cost was $4.64 per ton. The lowest month was October 1910, when the cost was $3.34. The working costs for mining, transportation, and milling are given in the subjoined tables, together with statistics of the output and development work at the various mines. In addition to the 41,938 ft. of development done by the company, 1298 ft. was done by lessees, making the total on the property for the year 43,236 feet.

Remembering the well known fact that the orebodies are irregular in size, shape, and grade, and that the ore is valuable enough to warrant careful handling, the management has never strained after low mining costs. Special effort is made to mine the ore cleanly, that is, to minimize the mixing of waste with the ore. Since much barren vein-matter looks exactly like the ore, it is possible to prevent mixing only by incessant sampling and assaying. Of course, any waste that goes into the ore is mined and milled at a dead loss, whether the resulting mixture is still of a pay grade or not. It will be observed that one foot of development work was done for every 6⅓ tons mined. This compares with one foot for a trifle over 7 tons mined during the year 1909.

Estimates of ore in sight have been made quarterly during the year, but these estimates are at best inaccurate and unsatisfactory, for the following reasons: (1) Estimates of tonnage have been found to vary between wide limits, according to the methods used in making the estimates, and according to the engineer's conception of what is 'ore in sight.' It should be remembered in this connection that it is impossible in the normal conduct of mining to expose any large percentage of the ore on more than two sides; much of it is exposed only on one side. (2) It is useless to fix a tonnage without also fixing a value for the reserves. This is exceedingly difficult, and must necessarily be somewhat in the nature of guesswork, on account of the presence of some extraordinarily high-grade ore in the midst of large bodies of average ore. One shipment of 150 tons averaged $1400 per ton. One ton of 50-oz. ore is equal in value to 50 tons of 1-oz. ore, and a mistake of 1000 tons of 50-oz. ore is equal to a mistake of 50,000 tons of 1-oz. ore. In the Consolidated mine the high-grade ore is far more erratic than the average ore, and there is enough of it to make quite possible a mistake of several thousand tons in estimating it. At the end of the fiscal year 1909, a very high-grade orebody had just been exposed in the Clermont shaft. After development had proceeded on this ore for several months, it was decided by the company that it would be the most profitable policy to extract this high-grade ore as rapidly as good mining would permit, so as to let the shareholders have their profits at once, rather than to spread them out over a longer period. This policy was announced in February. It was not the intention to convey the impression that the grade of ore maintained under this decision was the average grade of the mine. The extra 20c. dividend per quarter was in each case declared as an extra. Five of these extra dividends have been declared, amounting in all to $1 per share. While these extraordinary profits have thus far exceeded expectations, and may still do so, it is not reasonable to expect them to continue indefinitely. There is reason to believe that the mine can produce from the ore now exposed a tonnage equal to about twice that of the year just closed. This does not measure the possibilities, for the prospect for further development is good, and there is as yet no logical ground for fixing any term as the probable life of the mine.

As stated above, at the beginning of this fiscal year, the work of adding to the capacity of the 100-stamp mill was under way. This work, as well as other construction undertaken at the mill, is described as follows by the mill superintendent, J. W. Hutchinson: "To increase the tonnage from 650 to 850 tons per day, six 6-ft. L. C. Trent Chilean mills and 24 No. 3 Deister slime tables were added, which, with other minor changes, cost approximately $75,000. The change has been highly beneficial, and the cost of mechanical operation materially reduced. This reduction in cost of operation has been masked by a material increase in the cost of chemicals used, due to changes in the ore supplied to the mill. Were the same amount of chemicals being used now as during the last year's operation, the total cost of milling would be reduced 35c. per ton below last year's figures. When the mill was designed it was not known that the concentrate would be treated at the plant, which accounts for the inadequate facilities in the present refinery, as it was designed for an output not exceeding $300,000 per month. Approximately 70% of the recovery is made on concentrators, and consequently the cyanide bullion output has averaged over $600,000 per month. In order to handle this amount of product with the equip-

ment at hand, it was found necessary to drive the furnaces to the limit. After trying both fuel oil and coke, with indifferent success, it was found necessary to fire with distillate. By so doing it was possible to keep up the output, but at excessive cost. A defective bushing in this fuel line started the fire of April 8. A new refinery of reinforced concrete is now well under way. It will cost approximately $25,000, and will effect a saving of $5000 per month. For the purpose of heating the plant in cold weather, and for holding the mill solutions at a uniform temperature, two boilers have been installed. For obtaining more uniform agitation, there has been installed one Laidlaw-Dunn-Gordon low-pressure air-compressor."

In March it was decided to undertake the building of an electric storage-battery plant. The occasion for this was principally that the hoists at the Mohawk and Clermont shafts were run by compressed air. The compressors were taxed to the utmost to supply enough air for this and also to take care of the machine-drills. The outlook for increased hoisting requirements from greater depths made it necessary to look around for some other means of operating these hoists. Investigation showed that electricity was far to be preferred over any other form of power available; but under the existing contract with the Nevada-California Power Co. the large motors required for hoisting could not be employed without raising the peak-load to a prohibitive point. A thorough investigation of this subject was made by L. T. Merwin, whose conclusion was that a storage-battery system could be installed that would so equalize the load that the plant would pay for itself in the visible life of the mine, and also provide for all probable power requirements. The plan was accordingly adopted, the contract with the power company was extended to cover a period of seven and one-half years, beginning April 1, 1910, and construction begun.

Other construction undertaken at the mine was an equipment for the Laguna shaft, consisting of a steel head-frame, ore-bins, and hoist, a new roundhouse for the two locomotives, a new oil-storage arrangement for the railroad, and some changes in the tracks. A second-hand locomotive was bought early in the year. A new assay office has also been built and a new vault for the engineering department. It remains also to mention the fire-protection system. This has been made as thorough as possible. A concrete reservoir has been built on top of Columbia mountain, between the mine and the mill. A good pipe-line was built connecting all plants, and a thorough equipment of stationary monitors, hydrants, and hose, provided. A further system of automatic sprinklers was put in to guard vital points in the mill where even a small fire might cause a delay of operations. Before the main plant could be completed, temporary equipment, such as chemical engines and temporary fire lines, was put in. The whole expense of fire protection was $49,903. The system does the additional valuable service of reinforcing the water supply for milling purposes.

Unloading of Compressors

The modern air-compressor is a device that can be operated under direct and automatic control. In earlier days compressors were driven by a steam-engine or by water-power, the power being applied by belts or by means of gears. The first compressor was upright, that is, after the marine-engine type. An improvement was made when the straight-line compressors were introduced, as the steam-engine piston-rod extended from the steam cylinder into the cylinder of the compressor, which was in direct line with the former, thus increasing the efficiency of the machine. The load upon compressors is nearly always variable, and for many years various devices have been employed to either stop and start the machines automatically under the varying conditions of high and low pressure, or to manipulate the valves so that the machine would run at decreased load.

With water or steam-driven compressors various attachments have long been in use for this purpose. The devices on the steam-driven compressors usually depended upon the automatic movement of a lever, actuated by the air when it reached a certain pressure, this lever shutting off the steam either wholly or in part, thus stopping the compressor. When the pressure in the air-pipe diminished, because of the use of the air in operation of drills, in ventilation, by leakage, or otherwise, the same lever turned on the steam, and the compressor then ran as before until the cut-off pressure was again reached, when the compressor would stop again.

One of the earliest forms of unloaders was that of Clayton, 1866. In this, the discharge air was side-tracked. Instead of going into the reservoir against the stored pressure, it was diverted by a valve into the atmosphere, where it escaped without resistance. In this arrangement the machine during the period of no work continued to pump air, all parts, valves, etc., remaining in operation. However, it ran light, as there was no discharge pressure. There was, nevertheless, considerable power taken to force the large bulk of the uncompressed air through the valves, ports, and pipes, which were designed only to accommodate the air after its bulk had been reduced by compression. The noise of the escaping air was very disagreeable. Only a few machines with this attachment survive, and, although now free for all, it is only occasionally put on new outfits.

Another method of handling the discharge air and stopping the further compression was brought out by Sergent and Cullingworth. The discharge valves were held wide open, and thus the cylinder was filled with air of high pressure from the air reservoir. This kept the intake valves closed and no air could be taken into the machine. As the piston continued to reciprocate, the heavy pressure air was churned back and forth through the discharge ports. There were numerous other devices for unloading compressors. In the water-driven compressor a device is in use consisting of two cylinders, one vertically above the other, each having an interior piston, one, the smaller, for water pressure, the other for air.

By a system of small pipes connecting the respective cylinders with air and water, the compressor was held under automatic control, and would run or stop as required for hours without an attendant. By use of this ingenious arrangement the range of air-pressure could be regulated to within 3 to 5 lb. For instance, when the compressor was in operation, if it had a greater capacity for compression of air than the demand upon it, the gauge would indicate an increasingly greater pressure until at, for example, 100 lb. per sq. in., the pressure of air on the piston of the larger cylinder of the automatic cut-off would give an aggregate of pressure greater than that upon the piston of the water cylinder, upon which the air cylinder would be forced downward a few inches, causing the piston of the water cylinder to be carried down at the same time, thus, by connection with the valve, shutting off the water from the wheel. When the air-pressure decreased, say to 95 lb., from use, the aggregate pressure on the water cylinder then being greater, the water piston would be forced upward, re-opening the water valve, and pushing the air cylinder back to the position it occupied before, ready to repeat the same function when the air-pressure again reached 100 pounds.

The application of electricity to the operation of air-compressors required a somewhat different arrangement to control the compressor, as it is necessary that the motive power be applied constantly. The real problem to be solved is to consider the compressor as continuously running at maximum speed, yet having the amount of air compressed vary according to demand, and the power employed vary practically in proportion to the amount of air actually delivered.

A desirable unloader, as will be readily understood without elaborate explanation, should be free from undue friction; it should not promote conditions inviting explosions; it should not throw extra strain or load on the machine at the moment when valves are being changed to resume work. When unloaded, the compressor should run free and should take up or drop its work easily and quickly. Furthermore, it should be able to work with only partial capacity as well at full load as at no load, and when so working, at less than full capacity, each of the cylinders of a compound or two-stage compressor should do its proper proportion of the total work, so that the same economical and safe conditions are obtained at partial load, as are designed for full load under normal working conditions.

This is the problem solved by Hill and Morgan and developed satisfactorily by the designers and testing engineers of The Norwalk Iron Works Co. Unloading is accomplished by an air-control valve, an apparatus somewhat resembling a safety-valve, which, when the air has reached the predetermined point, allows the air-pressure to act on a plunger which trips a catch on the air valve-stem, thus releasing the valve from the driving mechanism and holding it open. Therefore, on the return of the piston the air which was taken in on the advance is rejected and returned to the atmosphere. This, of course, stops compression, and as the air passes out through a wide-open port specially designed for the purpose, there is practically no resistance to its entrance or egress. In fact, the indicator diagram from the unloaded cylinder, taken with the same spring as for the regular work, is a straight line drawn at the line of the atmosphere. There are no explanations or figures to be made; it shows practically no power consumed and is near perfection.

The Norwalk compressor unloads progressively, there being the exact degree of unloading that is necessary at any particular time. In a compound compressor both cylinders, when unloaded, are relieved simultaneously and in the same proportion. First, the inside ends of both cylinders are unloaded, leaving the outside ends still acting, working in perfect balance, and each cylinder doing its share of the two-serial compression. Second, if conditions require it, the outside ends of both cylinders unload, leaving the machine to coast without load and with no friction on the journals due to a vacuum or pressure in the cylinder. For a slight degree of unloading, one-half of a cylinder of air is dropped at intervals. As the degree of desired unloading becomes greater, these intervals increase until the amount of unloading becomes 50%, when the valves of the inside ends of the cylinders remain fixed at no load, and variations are then made on the load for the outside ends of cylinders. These changes of load can affect only one-half of a cylinder full of air at any time, and under the steadying action of the heavy and rapidly moving flywheel, changes in power and in compressor effort are effected smoothly and without jerk on motor, gears, or driving belt.

In many systems of power, such as gas engines and electric motors, it is of the utmost importance that they be started without load and the load thrown on only after full speed is attained. Frequently compressors are called on to start against pressure in the reservoir, either from a previous run or from other compressors then at work. As the cylinder of a compressor is full of air before the start, it is obvious that this air must be driven out at the first revolution. If it goes by way of the discharge valves it encounters resistance, and hence loads up the machine at the start. If the unloading scheme depends upon the plan of forming a vacuum in the cylinder, then the formation of this vacuum is a starting load.

In the Norwalk compressors, as has been explained, the intake valves are held open; hence the start is effected without load, for the air flows back into the atmosphere without compression and without vacuum.

Ancient miners used occasionally to resort to the waving of blankets in mine workings for the purpose of starting the air currents in motion to improve ventilation. The miner of today is amused at the suggestion, while he runs his bucket, skip, or cage up and down the shaft rapidly a few times for the very same purpose.

Bisbee—A Geological Sketch

By William L. Tovote

Bisbee was studied and described by F. L. Ransome nearly ten years ago. His report, published by the U. S. Geological Survey, has been ever since the main guide of the mining men in this camp, a sure proof of its excellence. But, if it is remembered that his investigation could cover only that part of the mining area then under operation, namely from the Queen incline to the Irish Mag shaft, then just opened, an area that represents less than one-half of the present field of mining activity, and that progress has since extended even more, relatively, in depth, than laterally, it is not surprising that new facts have appeared which tend to modify some of his deductions. To rehearse concisely the established facts: There are represented in the Bisbee quadrangle at least three maritime and three continental periods. The maritime epochs are:

1. Pre-Cambrian (pinal schist).
2. Paleozoic (quartzite and limestones covering the time from Cambrian to late Carboniferous).
3. Mesozoic (Cretaceous conglomerate, sandstone, shales, and limestones).

The maritime periods may have been longer, but if there were any later sediments, they have been eroded. Continental changes seem to be accompanied by volcanic activity, which is not surprising, as relatively deep movement and stress must open channels which extend down to depths where the volcanic forces are at rest, imprisoned by the superincumbent burden. If these fissuring forces act under or near great bodies of water, they will produce volcanoes, as all active volcanoes seem to emanate on continental fracture-zones, in or near oceanic bodies of water. If these fracture-zones are inland, they give vent to the more quiet volcanic activity, as evidenced by the eruptive rocks. The explosive force of sea-water suddenly transformed into gas, is probably the reason for the more instantaneous and explosive types of eruption. As it is, there are in this district three phases of eruptive activity which apparently occurred during the three continental periods: 1. The Juniper Flat granite, which I am inclined to consider as pre-Cambrian, correlating it with the undoubtedly pre-Cambrian granite at Clifton-Morenci, Globe, and other points in the Southwest. Mr. Ransome places this tentatively as post-Carboniferous, and roughly contemporaneous with the granite-porphyry intrusion, on account of the similarity in magma, and this in spite of the fact that the granite is cut by a later granite-porphyry dike. Similarity in magma is hardly a proof for contemporanity, as practically the same magmatic combinations extend over tremendous periods, and seem to change from the more silicious magmas to the more basic as our planet ages, perhaps because the easily fluxing and light silica is being exhausted in the deep sources of the dormant magma.

Mines at Bisbee, Arizona.

2. During the second continental epoch, between Carboniferous and Cretaceous age, occurred the most important eruption in this district, that of the granite-porphyry, with its main mass, the Sacramento hill stock, and numerous intrusive dikes.

3. The third continental period corresponding to the great porphyry intrusion in the vicinity of Morenci, is represented only by lesser activity in this camp, as shown in the Glance porphyry dike, that cuts the Cretaceous conglomerate. Perhaps a few other dikes inside of the present mining area, relatively little altered and approaching the quartz-diorite type, might be classed with this one. More

recent volcanic activity elsewhere in Arizona, represented mainly by basaltic and rhyolitic lava-flows of Tertiary age, is not in evidence in the Bisbee district.

The metallic content of the orebodies of Bisbee district are: 1. Bodies of lean pyrite with slight admixture of finely disseminated copper sulphide, of no economic value at present. (Original stage.) 2. These same pyrite bodies enriched by chalcopyrite (ascending solutions), and chalcocite (descending solutions), workable. (Secondary stage.) 3. Oxidized orebodies as last stage, containing copper salts and iron oxide and sometimes residual kernels of pyrite, accompanied by masses of ferruginous clay and pure kaolin (ledge matter). The copper ores for this group are chalcocite, native copper, and cuprite for the lower horizons, and the copper carbonates for the upper, most thoroughly oxidized horizons. Azurite seems to be the final product. Tenorite and chrysocolla, the latter rather inconspicuous in this district, seem to maintain an intermediate stage, together with several copper salts of lesser economic importance. The rocks that are intimately connected with the copper deposits, which are of present economic importance, are the Paleozoic series of limestones, the Cambrian (Abrigo), the Devonian (Martin), the Lower Carboniferous (Escabrosa), the Upper Carboniferous (Naco limestone), and the post-Carboniferous intrusion of granite porphyry. The Escabrosa limestone has maintained its position as the main ore-bearing horizon, but even here the lower strata seem more favored than the upper ones. The Escabrosa is chemically the purest member of the limestone series. The Naco limestone, in spite of exceeding in thickness the lower members (Abrigo and Martin) is less favored by ore deposition. The orebodies encountered in the Naco are very few, but the Martin and Abrigo limestones have been proved ore-bearing. The Lower Carboniferous limestones have long been recognized as ore carriers in different districts, notably Leadville, Clifton-Morenci, and Bisbee, which is something that seems to defy explanation. Contemporaneous deposition of metallic sulphides seems to be rare in Bisbee, for if such were the case a more general distribution (dissemination) throughout the rock would be noticeable, whereas in the present day copper deposits the lean pyrite occurs in large irregular bodies in the sediment. They have thus far been regarded as typically of metasomatic origin. In these lenses pyrite has replaced the feldspar and micaceous minerals in the porphyry, and it also invaded the country-rock at the contacts, changing the porphyry and the Pinal schist to a mixture of quartz and pyrite with disseminated sericite. The contact action on the limestones is not nearly as conspicuous in this camp as is often observed elsewhere, where limestones have been cut by eruptive magmas, and outside of a contact-zone around the Sacramento hill stock, the changes are mainly microscopic. Primary contact-metamorphism seems to consist mainly in silicification of the limestone, re-crystallization to pure white marble, and the development of heavy silicates, such as garnet (grossularite), tremolite, diopside, and vesuvianite. The oxidation of garnet furnishes iron oxide, to which may be attributed the rusty color of the cavernous siliceous rock, where the contact-zone is exposed at the surface. A later process that might, perhaps, still be called contact-action, seems to extend from porphyry dikes along certain shaly layers in the limestones, mainly the lower Martin and Abrigo limestones, and develops well-defined pyrite crystals, and small bunches of pyrite. This process must have continued for a long time, as pure white kaolin is also developed and traverses adjoining limestone beds along small cracks, which latter process is apparently later than the contact-metamorphism. The limestone beds thus affected show frequently flat crystallized pyrite individuals along cleavage and bedding planes. This pyritization of the limestone does not extend far from porphyry dikes or the aforesaid shaly layers. The changes in porphyry and sediments seem to indicate a large addition of silica and iron sulphide from ascending solutions subsequent to the intrusion of the porphyry into the disturbed area, following channels opened by the intrusion and in consequence of it. These additions removed large amounts of alumina and calcium carbonate. The calcium carbonate was more readily disposed of by circulating waters and that portion not redeposited was carried off. The alumina, on account of its greater insolubility, remained in the disturbed area and furnished the material for the so-called ledge matter. A process akin to magmatic segregation must be a strong factor in nature's laboratory. It causes copper to accumulate about a copper nucleus, iron about iron, and so on, so it is no surprise that there are found many porphyry dikes that consist practically of quartz and pyrite, while others, or even the same dikes in other places, consist principally of soft aluminous minerals of a clayey nature, with imbedded quartz grains, and still others that are mostly masses of kaolin, that exhibit only indistinct evidences of a former porphyritic structure, and as a last development, masses of kaolin that might either represent original porphyry or the deposition of kaolin in fissures and cavities. In the last case I have assumed that open channels for rapid water circulation existed. This is easily deduced from the generally disturbed condition of the district and is evident in faults representing relative lateral as well as vertical movement of adjoining blocks of ground. Great lateral stress must have continued for a long period, that culminated in the Glance overthrust fault of late Cretaceous age, described by Ransome. Other overthrust and lateral movements are traceable. This lateral stress was certainly to some extent active during the period of porphyry intrusion and helped to create lines of weakness for intrusion of the porphyry that frequently occurs along bedding planes in the form of sills.

Vertical stress manifests itself in numerous faults of different types, which have divided the rocks of the district into small blocks. Of these faults there can be discerned at least three main groups: the first antedating the porphyry intrusion, its main representative being the Dividend fault with a throw of at

least 5000 ft. It was followed by the intrusion of the porphyry stock of Sacramento hill. Many of the porphyry dikes seem to follow other pre-existing fault-planes. The second system of faults may represent a re-adjustment of equilibrium after the porphyry eruption, which, with fissures in the cooling magma, resulted in the creation of channels for the ascension of heated solutions initiating silicification and pyritization and providing cavities for the deposition of the pyrite bodies. The third group, perhaps to be identified with faults that cut the Cretaceous strata, traverses and dislocates the solid pyrite bodies, and furnishes channels for enriching solution both from below (chalcopyrite), and above (chalcocite). The study and identification of faults is rendered very difficult in this camp by the extended covering of undisturbed Cretaceous sediments and by the homogeneous character of the limestones, that make the establishment of certain horizons difficult; also by reason of the thorough alteration which large portions of the formation have undergone. My idea of cavities for the deposition of original pyrite is somewhat at variance with the generally accepted theory of metasomatic deposition. Metasomatic deposition, as heretofore accepted, would imply the dissolution of the limestone, grain by grain, and its replacement by ferric sulphide. Now, even if this replacement should start from an original fissure, it would grow in offshoots from this fissure along cracks and bedding planes, and the ultimate orebody would necessarily represent a central body with radiating branches and change gradually from solid pyrite through partly replaced to unaffected country-rock, as, for example, in the deposits of the Mississippi Valley, if my conception, gained only from the literature, is correct. (See Fig. I.) I doubt if there is any pyritic orebody to be found in Bisbee district that would indicate an origin along these lines. On the contrary, the pyritic bodies appear as solid masses, usually surrounded by a rather thin clay selvage with pyrite and copper sulphide as an impregnation. This in turn is surrounded by hard solid limestone which, if it shows any change at all, is only that of the usual contact metamorphism, such as its recrystallization to pure white marble or silicification and the development of heavy silicates. Metasomatic orebodies would start along fissures and cracks, but their growths would most likely spread along bedding planes. In Bisbee are found many orebodies, especially in the oxidized zone, that seem to follow bedding planes, but in almost every case it is possible to trace along their extension the remnants of an intruded porphyry sill, and the orebody is observed to cross the limestone beds wherever the dike changed its course and crossed the strata. Special consideration ought to be given those orebodies that have long been covered by permanent ground-water, as their features are the least likely to be obliterated by the action of the oxidizing solutions from above. At the Junction mine is an instance where, probably, a local basin of permanent water, cut off from circulation by earth movements, has been drained by years of pumping, and here are found conditions which are most valuable in tracing genetic relations. The Junction shows orebodies that approach closely the type of fissure-vein filling. The orebodies traverse the limestone beds, and show enrichment, widening out at cross-fissures and terminating, as a rule, in clay-filled fissures. These latter are most easily explained on the theory that they are altered porphyry dikes, and they are very frequently found connected with unmistakable porphyry dikes.

The extensions of these orebodies are decidedly more nearly vertical and normal to the bedding planes than lateral along the bedding planes. As a rule, they show a very sharp and distinct hanging wall of unaltered limestone, the foot-wall showing less abrupt changes.

One orebody, that particularly represents these features, I wish to describe more in detail. It rises from below the 1500-ft. level, the lowest point thus far exposed, to nearly the 1200-ft. level; but its extension is interrupted by faults and deflections along bedding planes. Its average width might, perhaps, be 20 ft., but it is very irregular, sometimes thin and sometimes widening out where cross-fissures cut it. The original body is solid pyrite. It has been enriched by chalcopyrite and chalcocite. The richest parts are along cross-fissures and at the foot and hanging walls. Within the orebody the chalcopyrite enrichment extends farther than the chalcocite, and has intergrown more commonly with the pyrite, owing to its earlier beginning and longer duration, but it still shows clearly its origin from feeding fissures. The chalcocite is generally limited to a coating of the primary sulphides along cracks and planes of crystallization, with a more solid replacement along the walls. The hanging wall is hard limestone separated from the solid pyrite by a thin band of clay which is impregnated with sulphides. The foot-wall is remarkably irregular, presenting a contorted, almost wave-like appearance. The limestone at the foot-wall shows signs of leaching, but it changes in a short distance to hard solid rock. Above it rests a layer, several feet thick, composed of earthy chalk and clayey material conforming to the foot-wall.

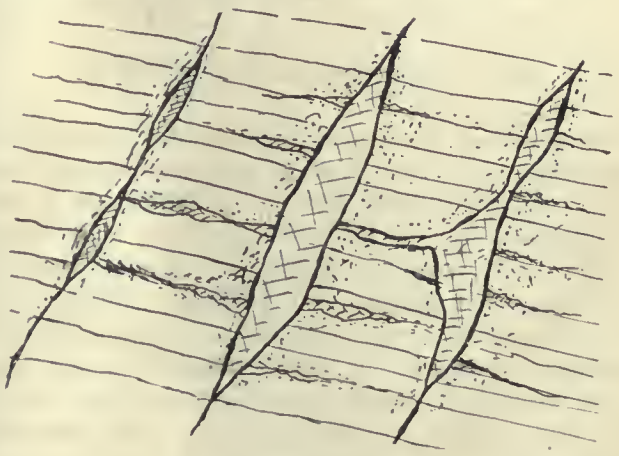

Fig. 1.

A seam, often increasing to about 2 ft. in thickness, of sooty or granular chalcocite, separates it from the solid pyrite body, which also follows the outline of the foot-wall. (See Fig. 2.) The

pyrite shows no crushing and re-cementing, so that the conclusion impresses itself that the sulphide has been deposited after the foot-wall had assumed approximately its present shape, and would therefore constitute a filling of pre-existing cavities; or, following the theory of metasomatism, that a porphyry dike, remnants of which are represented in the clayey material, followed existing openings in the

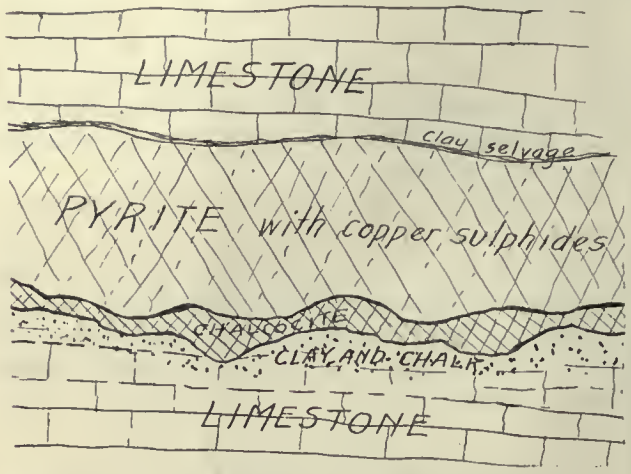

Fig. 2. Cross-Section of Orebody at Junction.

limestone and was replaced by pyrite from ascending solutions. That it is the porphyry and not the limestone that lends itself most readily to metasomatism is shown time and again, even in the most thoroughly oxidized orebodies, where large boulders and masses of slightly altered limestone intrude into the ferruginous clay and kaolin, being sometimes entirely enveloped by them. Considering the contact action of porphyry on limestone, this is only natural, because the impregnation of the limestone

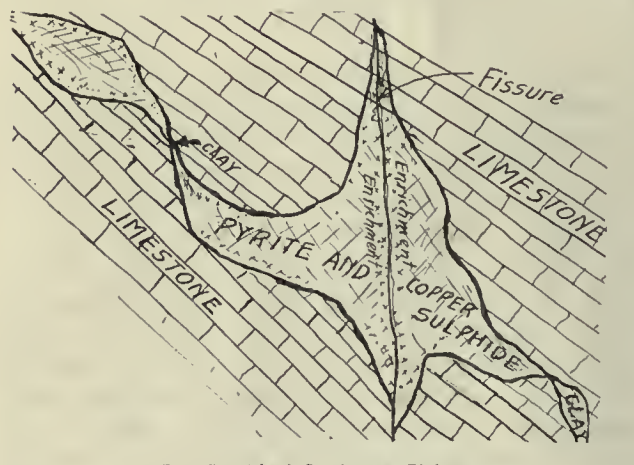

Fig. 3. Ideal Section at Bisbee.

with heavy silicates and silica renders the limestone dense, hard, and impregnable to aqueous solutions.

Alumina could not possibly be derived from the limestones of Bisbee, except, perhaps, in case of the Martin and Abrigo limestones. Its source points rather strongly to the porphyry, and clay is in evidence everywhere that orebodies are found; more particularly with the oxidized orebodies than with the sulphide masses. These orebodies occur mostly in the Escabrosa limestone, which, in its representative development, is practically pure calcium carbonate, according to Ransome. In due course, limestone also will be replaced, but apparently it resists metasomatism for a long time. The condition is represented by the accompanying sketches, Fig. 2 and 3.

Delafossite is a mineral that constitutes an important copper ore in certain horizons. It is practically 50% copper oxide and occurs in black shiny flakes resembling graphite. It is very soft, and will

blacken paper. The definite establishment of its identity is pending.

As to the time when the copper was introduced in the Bisbee area, it must have followed closely the porphyry intrusions. Even the lean pyrite shows admixture of copper mineral, and in places favored

Fig. 5. Section at Hoatson Mine.

A, hard limestone with cuprite and malachite along cracks; B, chalcocite; C, ferruginous clay with native copper, cuprite, and delafossite.

by conditions hard to understand, solid bodies of chalcopyrite are found that seem to represent an original deposit; as, for instance, the contact-zone near the Gardner, Holbrook, and Oliver mines. A secondary enrichment appears in these chalcopyrite bodies, in the development of bornite, which sometimes has intergrown with the chalcopyrite, forming an intimate mixture, while in other places it appears as a cement surrounding and binding pieces

of fractured chalcopyrite. As contact metamorphism is more the action of heated solutions in consequence of magmatic eruption, than the action of the liquid magma itself, there orebodies may be considered as workable, primary contact-deposits.

If the deduction be accepted that the porphyry was the main seat of metasomatism, the character of the ledge matter, that has been puzzling the geologists a good deal, is easily explained. Even the freakish oxidation that stops sometimes a few hundred feet below the surface, and in other places nearby descends a thousand feet or more, is more easily understood as it may be assumed that oxidizing solutions traveled mostly in lateral directions until they reached strong porphyry dikes, such as the Shattuck and Lowell dikes, where they were deflected downward along these dikes. Even the original Copper Queen orebody, with its nearly cylindrical shape, and its walls of hard, solid limestone, points naturally to its origin as a replacement of

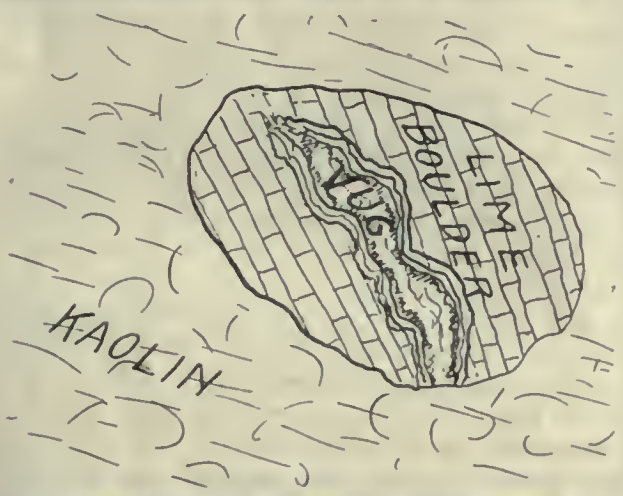

Fig. 6. Large Boulder of Hard Limestone Imbedded in Masses of Kaolin and Ferruginous Clay at the Hoatson.

The clay contains tenorite, native copper, and delafossite. The vug contains calcite and native copper intergrown.

a volcanic funnel, the porphyry being, most likely, an extension of the sill that originated the great southwest orebody. The disposition of porphyry dikes to follow planes of bedding, forming sills along limestone beds, has long been established. It takes only the application of this fact to prove that the clayey masses are derived from the porphyry.

Limestone, if altered, will have a dry, earthy appearance, and in case of siliceous limestone, will disintegrate to loose quartz grains and recrystallized calcite. Iron oxide and copper carbonates will be in evidence. Parts of orebodies represent this feature. Iron carbonate (siderite) seems to me a logical intermediate development, but I have not been able to identify it in Bisbee. For the oxidized orebodies I wish to suggest a subdivision:

1. Those that were transformed in place. All orebodies that show residual kernels of pyrite belong undoubtedly to this group, and even where pyrite is absent in higher levels, solid masses of iron oxide would point to its former existence.

2. Those that might have undergone transformation, chemical as well as mechanical. These would not necessarily be connected with a traceable porphyry dike. They are apt to show a certain stratification, and $CaCO_3$ will be more in evidence. They would be represented by the filling of cavities in limestone or wherever natural conditions favored deposition.

Returning to the problem of the favored position for ore deposition maintained by the lower limestones as against the Naco limestone, an explanation might be found in the theory that fracturing and faulting started in early Carboniferous age, introducing the continental uplift to the close of that period, and that the Naco limestone might have been deposited after much of this fracturing force had spent itself and therefore did not afford as easy channels for the magmatic eruption as the lower members of the sedimentary series. The Dividend fault is plainly later than the Naco limestone, and it gave rise to the main porphyry stock, but the mineralizing solutions seem to have been more deflected by branching dikes as far as they did not follow fissures in the cooling magma itself, and the flat

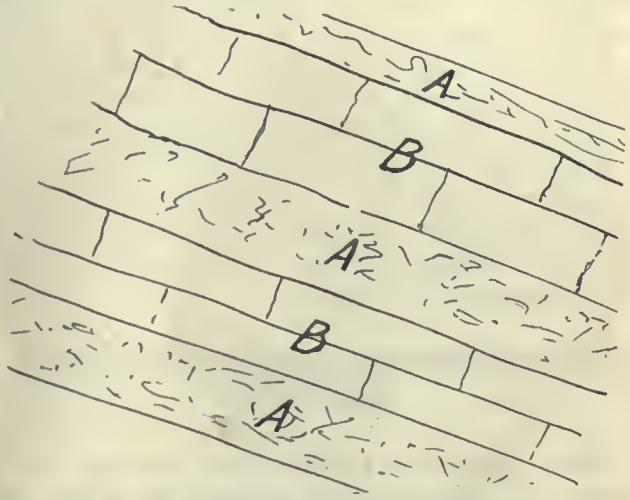

Fig. 7. Ferruginous Clay and White Kaolin.

A, with native copper, chalcotrichite, and delafossite, at the Hoatson mine alternating with slightly altered limestone. B, containing native copper in flat dendritic aggregates along cleavage and bedding planes.

porphyry sills lend themselves naturally more to the collecting and mingling of aqueous solutions with the resulting ore deposition. That leads me to believe that disseminated chalcocite (concentrating ore) has been found in the Sacramento hill stock, that for a long time had been considered barren. This fact opens a wide field for the future of the district. The porphyry and the Pinal schist, resembling it closely in composition, afford the same possibilities as in other porphyritic copper camps. The copper solutions of Miami district have, without doubt, penetrated these rocks; pyritization and silicification are in evidence everywhere, and strong lodes or vein systems are traceable in their outcrops. Many surface prospects disclose more encouraging indications than, for example, the barren surface of Copper mountain at Morenci. It is my firm belief that Bisbee needs only careful prospecting to disclose 'porphyritic' deposits in Sacramento hill and east of the Dividend fault, where money and effort have been wasted prospecting in depth for 'metasomatic' orebodies, while the prospecting should have been done laterally at a reasonable depth, for 'porphyritic' ore. The properties of the Cochise and Copper King development companies, together with

the claims held by the Calumet & Arizona around Johnson Addition and the territory of the Denn-Arizona east of the Dividend fault constitute promising ground for prospecting, and I hope yet to see great mines developed here when, or better before, threatening exhaustion of present resources directs the energy of prospecting into new fields. As to the exhaustion of the present type of ore deposits, there is hardly as yet any general indication, even locally, though the great production of these past years might have been expected to leave deep traces of such exhaustion. There is especially the great, hardly-opened territory of the Superior & Pittsburg and the area extending south and west under the covering of Cenozoic agglomerates. But, will the orebodies continue workable with increasing depth? How soon will be encountered horizons where lean pyrite, hardly affected by secondary enrichment, will defy exploitation under present conditions? These considerations, besides many others, seem to make it almost impossible to determine a fair basis of comparison for consolidation of Calumet & Arizona and Superior & Pittsburg. On the one hand is a small but rich territory, thoroughly exploited and having paid astonishing returns for years; on the other, a great territory with proved rich sections, which has struggled through great adversities to a paying basis, and the resources of which it is impossible to estimate.

SINKING THE LIGHTNER SHAFT, ANGELS, CALIFORNIA.

The Lightner Gold Mining Co., which has taken over the Lightner mine at Angels Camp, Calaveras county, California, heretofore operated by the Lightner Mining Co., is sinking a new three-compartment main working shaft, and the following particulars will be of interest, showing work done upon the Mother Lode. The shaft is being sunk in the hanging wall 'greenstone' (the seams of which are nearly vertical), for the reason that a layer of talc-schist with a dip to the southeast comes in from the footwall side of the main fissure. The shaft is 17 by 7 ft. outside the timbers, and, being intended for permanent work, is being heavily timbered with 12 by 12-in. mountain red spruce. For the first 60 ft. the sets were at 2-ft. centres; 4-ft. centres for the next 100 ft., and then 6-ft. centres. Sinking by hand was commenced October 20, 1910, and by the end of the following month, a period of 40 days, an even 100 ft. had been sunk and timbered. Meantime, the 150-hp. compressor had been moved over and installed, and drilling with machine started. Twelve miners, divided into three 8-hour shifts, were employed, and four 'baby' Pacific drills put into operation, and during the month of December 117½ ft. was sunk and timbered. To date, January 24, a further 80 ft. has been sunk and timbered, besides drilling at the 200-ft. station for an ore-pocket with a capacity of 300 tons. The gross cost, with timbers at $22 per M., has been $28.20 per foot. To date the hoisting has been done with a small winze-hoist of capacity only for the shaft work, but the main hoist has been transferred from its old site, set in place, and would be in full operation now but for a delay in erecting the 60-ft. head-frame, caused by the beneficent rains of the past fortnight. It is expected that the shaft will have reached the 400-ft. station, cross-cuts extended at 200, 300, and 400-ft. levels, to connect with the mine workings, and that the 60-stamp mill will be in full operation by April 1 next. Besides the sinking of the shaft, the 200-hp. hoist, the compressor and building, blacksmith and machine shops have been moved across the claim and set in place. A new 500-ton ore-bin has been built alongside the head-frame, and 25 ft. below the collar of the shaft, which the contour of the ground permitted, and two 10 by 12-in. Blake crushers set on the bin 10 ft. above the ground; this allows the discarding of any large pieces of waste that may be mixed with the ore, and the removal of which will increase the milling grade probably 50c. per ton, at a monthly cost of $150. The bin is unloaded by a direct rope-haulage tram 450 ft. long on an even 10% grade to the mill ore-bins.

The shaft will cut the vein at a depth of 800 ft. and the work has been designed so that it may be continued to 2000 ft. All machinery is driven by electric power. As an illustration of the possibilities of Mother Lode mining, it may be stated that at 243 ft. in the shaft the apex and northern limit of a new vertical vein of ore was discovered which has since persistently continued, showing 4 ft. of quartz in the shaft, and more lying to the west of it, of highly payable ore. If the shaft had been commenced 10 ft. either north or east of its site, this orebody, which adds materially to the value of the mine, would possibly have been missed. The cost of sinking this new shaft is shown in detail in the following statement:

DISTRIBUTION COSTS, LIGHTNER SHAFT

	Per foot.
Labor	$15.70
Timbers	4.65
Explosives	2.12
Supplies and candles	1.72
Electric power	1.68
Carting and miscellaneous	0.63
Superintendent (apportioned)	1.70
Total	$28.20

ELECTRIFICATION OF KONGO RAILWAY

A study is being made of conditions on the Kongo river between Matadi, near the mouth of the Congo, and Leopoldville, for obtaining power to electrify the railway between the two places operated by the Compagnie du Chemin de Fer du Kongo. This railway is the connecting link between the Upper and Lower Kongo, and is about 250 miles in length. The river has numerous rapids and falls between the two places, from which it is expected to obtain the necessary power. Freight and passenger rates are at present high, accommodations inadequate, and two days are required to make the trip from Leopoldville to Matadi.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Thin Rock Sections

The Editor:

Sir—Perhaps one of your readers, who has made rock-sections for use under the microscope, while abroad, would be kind enough to give a short article describing the most convenient apparatus to employ and the way to arrive at the best results in the least time.

INQUIRER.

Medellen, Colombia, S. A., December 26.

A Word of Caution

The Editor:

Sir—I have received information from various sources that a man representing himself to be Frank C. Loring, mining engineer, of Toronto, Canada, has been obtaining loans and securing favors from engineers and others in Utah, Colorado, and elsewhere, on this representation. I have not been in the Western States and Territories for the past four years, all of my work having been confined to eastern Canada. Consequently this person is making false representations, and is perpetrating a fraud in my name.

FRANK C. LORING.

Toronto, Canada, January 15.

No. Keep on Prospecting

The Editor:

Sir—Through the magazines and newspapers, Mr. Edison advances some startling prophecies as to gold: (1) That science, 'any day,' may manufacture gold at a suggested or possible cost of $25 per ton; but from what, is not clearly intimated. (2) That by further cheapening of processes there will be overwhelming production from limitless quantities of low-grade ore, clay deposits, the very oceans—gold everywhere. The result would be that the finances of the world would be overturned and wrecked by the flood of this to-be worthless metal.

What do you think, Mr. Editor? How are we to stand from under? Abandon our gold mines on the impending contingency? Invent (and patent) some new basis of values? Or, if lucky enough to sell before the rush, what to take in exchange?

DR RAY SMITH.

Oakland, California, January 16.

A Creditable Annual

The Editor:

Sir—This is to congratulate you upon your splendid issue of January 7. It makes me feel proud of being a miner and serves to foreshadow, by the universal extent of our work, the general acknowledgment of the brotherhood of man. Mr. Rickard's review of the London mining market is a great piece of work, with its array of startling facts. These facts, if kept in mind, should have a salutary effect upon the editorial writers of the *Press* and *Magazine* who occasionally treat us to illogical praise of an advocate of a distorted righteousness, or to a dissertation upon an economic problem outside of mining in which the multiplication table is not permitted to play its proper part. Even these lapses are not without compensation, as, wherever read, in the frozen North, or South, or on the burning deserts where a few of us are gathered, and these 'by the ways' are discussed, we do not protest. I wish there could be found some way in which the wealth of affection that you gentlemen have so well earned could be made manifest.

To return to Mr. Rickard's figures for Great Britain: In 1910 exports were £530,000,000, imports £666,000,000, or an excess of imports of $680,000,000. These figures are treated in that benighted country with great joy, as *trade has veritably boomed*; while we Americans, of the United States at least, still insist that when our imports exceed our exports we have an unfavorable balance of trade. The Britishers, however, seem to have been able to invest more new capital in foreign countries during 1910, to the amount of $500,000,000, and to have made other investments during the same year, of $580,000,000, all from the earnings of their investments. From other sources than Mr. Rickard's letter, it is learned that a good measure of present British prosperity can be fairly credited to the fiscal measures introduced and now made operative by the British Radicals who have just been returned to power by the British people, notwithstanding our advice that radical measures should be made operative or applied by Conservatives.

One of the articles in your issue of January 7 recalls an ancient philosophy that with its theory of the universe attempts to satisfy the logical mind. The physical universe, with all it contains, is said to be an expression of divine will, or at the moment it is said to be the Day of Brahma. Eventually contraction or concentration will take place until the material universe becomes a mathematical point. We will then have the Night of Brahma. This philosophy is recalled by your story of the Comstock for 1910. The great Lode, in the light of your report, has contracted so that there seems to be but the Mexican Mine, and this mine, by the way, is far from being 50 years old. It is not the mine of that name that plays an important part in making the old Comstock famous, but a secondary product of a period of more or less frenzied finance that formed an epoch in the Comstock history. The activities of the present Mexican seem to be confined to an east mineral-bearing formation, and to general criticism, while the great Comstock Lode is left untouched.

MINER.

San Francisco, January 20.

Never abandon a prospect, no matter how poor, that continues to improve with work. It may develop into a valuable mine.

Special Correspondence

LONDON

Tin Mining in the Malay Peninsula. — Tanganyika Concessions.— The Corocoro Copper Mines.

I have heretofore mentioned the fact that Cornishmen who have knowledge of tin mining are more ready to invest in ventures abroad than in those in their own country. James Wickett, the veteran stockbroker of Redruth, can more easily raise capital among his local friends for new ventures in the Malay than for resuscitations of mines in Cornwall. Much discussion is continually taking place with regard to the soundness of this policy. The results at Gopeng, however, fully endorse Mr. Wickett. This company was organized in 1901 to work tin gravel at Gopeng in the Kinta district of the Province of Perak, Federated Malay States. The issued capital is 71,200 shares of £1 each. The company has been successful and the profits have been sufficient to pay over 200% on the capital. During the year ended July 31, six monitors were at work continuously. One of them has been used as an elevator since March, and the treatment of the low-lying ground has been greatly improved thereby. The output of tin concentrate at Gopeng during the year was 383 tons, which sold for £32,953. The cost of working was only £6976. At the subsidiary Ulu Gopeng property 93 tons of concentrate sold for £8027 and the cost was £4826. After paying office expenses and income tax, the profit available for distribution was £28,733, which is the largest figure yet recorded. Out of this £24,920 has been distributed as a dividend at the rate of 35%. The managers, Osborne & Chappel, report that prospects for the future are excellent. The low cost of operation and of administration is specially notable. The directors' fees, secretary's remuneration, auditors' fees, office rent and expenditure, postage, and cables only totaled £490, and the manager's fees were included in the local expenses. The list of directors contains such names as Wickett, Bain, Lanyon, and Pearce, all long connected with Cornish mining and metallurgy.

Another Malay tin-mining company, the Pahang Consolidated, has not done so well. This is not owned in Cornwall, but in London. It was formed in 1906 for the purpose of consolidating the business of the Pahang Corporation with that of adjoining tin-mining companies, all operating on the eastern side of the Malay Peninsula. The management is in the hands of the Borneo company. Two years ago it was found that the ore reserve had been greatly overestimated and that the lodes required energetic development. Many of the tin properties in the East are alluvial, but these are vein mines, and the tin is accompanied by many other minerals, such as pyrite, arsenopyrite, chalcopyrite, and blende, which introduce complications in concentration. When it was found that some active steps must at once be taken to develop the mines, Reginald Pawle was sent by the Borneo company to take charge of operations, and early in the present year, when it became obvious that additional capital was required, William Frecheville was asked to make an independent examination. His recommendations coincided with those of Mr. Pawle, so £250,000 new capital was created and £125,000 subscribed. At the same time the Borneo company, which advanced funds amounting to £39,000 as working capital, accepted debentures to secure the debt. During the year ended July 31 last, 80,736 tons of ore was mined and milled, producing 908½ tons of tin concentrate; in addition the alluvial mines operated on tribute produced 54½ tons. The receipts derived from the sale of the 963 tons were £90,376, and the expenses at the mine were £87,425. London expenses, debenture interest, etc., extinguished the balance of profit and the net result of the year's operations was a loss of £7296. Of the expenses, development accounted for a large part, the sum being £20,208; the distance driven was 12,527 ft. Unfortunately this work has not resulted in any important discovery. Mr. Pawle gives some interesting information relating to experiments with an Elmore flotation plant which was erected for the purpose of eliminating the sulphides, thus obviating the necessity for roasting. Unfortunately the quality of oil used was unsuited for the purpose, and in spite of many variations it is not possible to effect so complete a separation as to make the roasting operation unnecessary. Other oils are now being tried with the hope that the flotation process may yet be successfully applied to these ores.

The great copper venture at Katanga in Congo, Central Africa, that is being pushed forward by Robert Williams, is being followed keenly by English investors. Much criticism has been showered on Mr. Williams in years past, but he has in a masterful way overcome all objections. The deposit is undoubtedly vast, consisting so far of oxides and carbonates, thus making the smelting proposition a difficult one, but more than all, the great distance from civilization was the drawback. Gradually Mr. Williams' energy has resulted in securing railway communication, as a branch now connects the Star of the Congo mine with the Rhodesian railways, and a new railway is being built to connect with the west coast of Africa at Lobita Bay. Some official details of the Tanganyika Concessions, the English company involved, will be of interest. It was formed in 1899 to acquire exploring rights in the central part of Africa, including tracts in the Belgian Congo and Northern Rhodesia. The chief mining asset is a 45% interest in the Belgian company, the Union Miniere du Haut Katanga, which owns the copper belt in Katanga in Belgian Congo, just over the border from Rhodesia. The company also owns shares in the Benguella Railway Co., which is being built to connect the copper mines with Lobita Bay on the west coast, and shares and debentures in the Rhodesia Katanga Junction Railway & Mineral Co. The last named company built the railway line from Rhodesia Broken Hill to the Star of the Congo copper mine, and it owns the Kansanshi copper mine in Rhodesia. The Belgian Katanga company owns an extensive copper belt in which are situated the Star of the Congo and Kambove mines, and also a tin belt farther north. Mr. Williams announces that they began to ship the new smelting plant to the Star of the Congo mine in September, and that the first unit, capable of producing 1000 tons of copper per month will be ready to start operations in April. Additional plant with a capacity of 1500 tons copper per month is now being shipped. Though the European coke costs £10 per ton, delivered at the mines, it is estimated that the cost of production of copper will be £32 per ton. When the Benguella railway is finished the coke will be much cheaper. The ore reserves at the Star, Kambove, and other mines, are so great that it is estimated that there will be no difficulty, when fully equipped, in producing sufficient ore regularly to insure an output of 200,000 tons of copper per year. The exploration of the tin properties is postponed until railway communication has been improved, and the diamond interests are to be sold to a subsidiary company.

We are continually on the watch for copper developments in the Andes. I have not seen hitherto any mention in American papers of the Corocoro copper properties in Bolivia, to the south of La Paz. A company was formed in England in August 1909 to consolidate a number of copper properties at Corocoro belonging to J. K. Child & Co., Carreras Brothers, Compania Sud Americana de Cobre de Corocoro, and Noel Berthin's heirs. The control is held in France. Rene de Batz is chairman and Isidore Brun is general manager. During the 11 months to June 30 last, the output was 57,947 tons of ore averaging 2.35% copper, and from this 1790 tons of concentrate containing 76% native copper was produced. This output is small, as work was practically suspended with a view to reorganizing the business of the various companies coming into the consolidation. The mining and metallurgical plant also require a general overhauling. Nevertheless, a profit of £13,240 was made, and after deduction of administration expenses, a net profit of £8382 was carried to the balance sheet. As regards cost, based on the production of 76% concentrate, it is figured that the cost per ton of copper at Corocoro is £3S. Railway freight to Mollendo is £5, and that by sea is £4.

A new main shaft is to be sunk and used instead of the numerous small shafts of the individual properties, and an aerial ropeway is being built. A great convenience will be gained by the completion of the new railway line from Arica to La Paz. It is now being constructed from both ends and should be finished next summer. The issued capital of the Corocoro company is £636,107.

The vicissitudes of the Frontino & Bolivia gold mine in Colombia have been many during recent years. The company was formed in 1864 to work the Silencio and other gold mines in Colombia, South America. Results were good for a long period of years, but from 1901 onward a variety of causes placed the company in an unsatisfactory position. The costs were high and it was decided to electrify the plant with a view to making operations cheaper. Unfortunately, however, the water-supply used for generating current was found to be unreliable. The directors considering that the mine had arrived at a period when altered conditions made further advice necessary, commissioned Pellew Harvey & Fell to examine and report, and a year ago George P. Chaplin was appointed manager. During the six months ended June 30 affairs improved. The ore sent to the mill was 13,140 tons from which gold to the value of £60,440 was recovered by amalgamation and cyanidation. This was an increase of £19,675 as compared with the previous half-year. At the same time the expenses advanced $8202. The working profit was £10,137, as compared with a previous loss of £1303. Out of the profit debenture interest was paid to the amount of £2256 and the remainder used to partly extinguish the adverse balance brought forward from the previous half-year. Mr. Chaplin reported that an increased amount of development work has been done, and with good results, but he foreshadowed the expenditure of further money in order that development may be brought well ahead of the mill. He commenced to overhaul the surface plant with the idea of raising more ore at a less cost. Unfortunately Mr. Chaplin has been obliged to resign after being there only one year, as the directors did not see their way to adopt his very proper suggestions.

MEXICO

Official Data on Mexico's Gold and Silver Production. — Real del Monte Mills. — Santa Gertrudis. — Sales of Mines. — New Oil Wells.—The Amparo Mine.

In the budget statement sent to the Mexican Congress, the Finance Department shows that in the first quarter of the present fiscal year, from July 1 to September 30, 1910, the gold production of Mexico increased ₱1,969,545.65, as compared with the corresponding period of the preceding fiscal year. The increase in silver production was ₱52,020.53. The quarter's output of gold was ₱12,388,151.43, that of silver being ₱19,023,570.38. The department's revised figures on the gold and silver production of Mexico in the fiscal year 1909-1910, place the former at ₱48,428,841.71, and the latter at ₱76,405,754.15. The gold output shows an increase of ₱3,413,887.46, as compared with that of the preceding year; and the silver output shows a decrease of about ₱700,000. In addition to the gold exported in the last fiscal year, the Exchange and Currency Commission purchased bullion for coinage to the value of ₱5,668,296.30; and the gold consumed in arts and trades had a value of ₱133,333.33. The silver purchased for coinage in the fiscal year had a value of only ₱107,603.45, and that used in arts and trades a value of only ₱33,870.

Incidental to the enlargement of the Loreto and Guerrero mills of the Compañía Minera Real del Monte y Pachuca, in Pachuca district, the treatment system is being brought up to the standard of modern practice. In the Loreto, a gyratory crusher, with automatic conveying, sampling, and weighing arrangements, has replaced the old jaw-breaker plant with car distribution. The new stamps weigh 1450 lb. each, and crush to 3-mesh. Nine additional tube-mills have been installed, making now 13, and instead of the elaborate concentration formerly practised, stage-crushing in tube-mills is employed, with concentration of only a small selected portion of the pulp. Pachuca tanks have taken the place of the agitation and decantation tanks heretofore used. The Loreto plant has been increased from 400 to 700 tons daily, and that of the Guerrero from 350 to 650 tons, the latter being nearly similar to the former in operation. The Real del Monte was successful in its development during 1910, and started the present year with ore reserves ten times greater than at the beginning of the preceding year. The mine improvements carried out include the reconstruction of the San Ignacio shaft, which is connected with the Guerrero mill by aerial tramway. This shaft, which has been equipped with a 250-hp. hoist, is the one through which the bulk of the Real del Monte ores will be handled, connection having been established on the 400-metre level. A Bleichert tramway, with a capacity of 400 tons in 10 hours, is being built between the Barron mine and the Loreto mill. The stamps of the new 600-ton plant of the Santa Gertrudis Co. (Camp Bird) are the heaviest thus far built for a Mexican mill, weighing 1550 lb. each. There will be 10 tube-mills for regrinding. The plant may not be ready to operate until next May. The San Guillermo, of the Santa Gertrudis mines, idle for several years, is to be the main working shaft; it will be equipped with a 350-hp. hoist.

A transaction of importance was the sale to American interests of the properties of the Seguranza Mining Co.,

Pachuca, Mexico.

in the Zacualpan district, State of Mexico, for ₱1,960,000. The Guggenheims are reported to be the purchasers. The sale was on the basis of ₱28 per share for the company's 70,000 shares. The Seguranza company was organized several years ago to acquire the old Coronas properties in the Zacualpan district, and in 1909 a stamp-mill and concentrating plant were built. The work of installing a cyanide annex was only recently completed. Shipments of rich ore have been made during the period of development. All machinery is operated by electric power transmitted by the Suitepec Electric Light & Power Co. Announcement is made of the sale of the Julieta gold-silver mine, in the Almoloya camp, State of Chihuahua, to Denny Bros., English mining engineers, who have been for some time giving attention to Mexican mining enterprises. The purchase price is stated to be ₱2,000,000. The mine has been under bond to Paul Ginther, of Santa Rosalia. The Quimica y Anexas mines, low-grade properties at Suitepec, State of Mexico, will not be purchased by the Exploration Co. of England and Mexico. A working option, arranged last year, has been surrendered, and the mines have been turned back to their owners, German Roth and associates, of Toluca.

Early in January the Pearsons brought in a great oil gusher at Potrero del Llano, State of Veracruz. The flow of the well, estimated at over 100,000 bbl. daily, has been forced to a height of several hundred feet. The new gusher outclasses that of Dos Bocas, also a Pearson well, and which was accidentally fired and burned out. Efforts have

been made to save the oil by the construction of earth dams, but, due to the tremendous flow, much oil has been lost. The Pearsons have been at work in Potrero del Llano field for about two years, and have brought in two other wells there. The oil stratum is from 200 to 300 ft. in thickness. Pipe-line and storage plans are being rushed. The principal well of the Huasteca Petroleum Co., in the Juan Casiano field of Veracruz, is stated to be producing at the rate of about 18,000 bbl. daily. The pipe-line from that field to Tampico is being operated at capacity. Huasteca oil is going to the Mexican National Gas Co. in Mexico City, the Waters-Pierce refinery at Tampico, and the Mexican Petroleum plant at Ebano, where it is mixed with the Ebano product for delivery to the National Railways of Mexico.

E. A. Montgomery, of Los Angeles, has arranged a year's working bond on the Zapote copper property in Ameca district, Jalisco. The price specified is ₱100,000. The Zapote is owned by the Mutual Mining & Milling Co. of Mexico City. Work directed by S. J. Lewis resulted in opening a new body of high-grade milling ore on the 400-ft. level in the Amparo mine, near Etzatlan, Jalisco. The Ampara M. Co. has paid dividends of 3% quarterly on $2,000,000 during the past year, and has a surplus, which may be used for an extra dividend. The Navidad Mines & Reduction Co., controlled in Berkeley, Cal., has a new cyanide plant in operation in the San Sebastian district of Jalisco. Direct cyanidation is employed. The company is making plans for an 800-hp. hydro-electric plant on the Ameca river. As a result of arrangements for the piping of natural gas from the Reiser field in Texas across the international boundary to Nuevo Laredo, the establishment of a zinc smelter at that gateway is being considered. The United States returns show that zinc imports from Mexico in 1910 amounted to 80,309 tons, a decrease of 26,116 tons compared with the imports of 1909.

Ore stealing is so prevalent in the Mexican mines that ore dealers are to be placed under license and heavy bonds, and more stringent laws enacted against the crime. It is understood that the British syndicate which some months ago purchased the Torres & Prietas railroad is making plans to broaden the gauge of the road and extend it to a connection with the Yaqui River division of the Southern Pacific railroad, making a junction at Soyopa, Sonora.

There has been considerable activity in the vicinity of Velardeña during the past 60 days, several mining men having taken leases on properties in that district. Frank Carver has resumed operations at his mine in Velardeña and during the past month has shipped three carloads of ore to the Velardeña smelter. J. H. Williams has resumed work on the Libres mine for the American-Mexican Mining Co. and is shipping a good grade of ore. W. H. McCord has the mill at El Tajo about ready for operation. The Argentina de Anexas mines in Minas Nuevas are reported sold for $300,000.

JARBIDGE, NEVADA

Extensive Development and Good Prospects in the New District.—Outlook for Next Spring.

The adit on the Jarbidge Ely Mining & Development Co.'s property is now in 65 ft. and has entered slate which is supposed to be the wall-rock of a vein. It is expected to cut the first vein within the next 10 ft. This adit is on the Guess claim and is expected to cut the several veins east of the Pavlak, including the Pick, Success, Bluster, and Rock Creek, all of which have been opened a little to the south of the Jarbidge ground showing large veins and rich ore. These veins can all be traced onto the Jarbidge-Ely ground. This company has secured from W. R. Featherstone the lease and bond of the Guess group, comprising the Guess, Guess Again, Guess Fraction, Buster Brown, Sport, Short, and Search Me claims. This group is advantageously situated in the heart of the proved mineral district, and is on the strike of several of the best veins opened and is close to rich orebodies. Rich float is found and good pannings can be had from surface dirt in many places. A vein has been opened in quartzite on the Guess Fraction. Two openings have been made on the Buster Brown, and both veins show good pannings; these veins are west of and just below the quartzite. The company is composed of California, Illinois, and Idaho people who propose to thoroughly prospect the ground and have put up capital for this purpose. Mr. Featherstone has retained an interest in the company and is general manager, with Angus McDonald as superintendent. O. F. Rudd of Quincy, Ill., one of the officers of the company, has been inspecting the property and is well pleased.

The adit on the Rainbow has reached the Pavlak vein and is 5 ft. into the quartz. The quartz is similar to that found in the North Star and 4-M, which carries the best value. Usually it is a fine granular white quartz, but here it is heavily impregnated with pyrite. The vein is well mineralized throughout the 5 ft. A drift will be run on the vein to the south, as the surface indications point to rich ore a little to the south of the adit. Theodore Parks, the superintendent, is closing a deal on some Crater claims, but it is expected that he will soon begin new work on the vein. The adit cut the vein at a vertical depth of 125 ft. The adit on the St. Joe group is rapidly proving the southern extension of the Good Luck vein. It is in 60 ft. and wholly in the rhyolite vein-matter, with a constantly increasing amount of quartz, the face of the tunnel being almost entirely quartz which is heavily mineralized with pyrite, all of which shows some value. Very few assays have been made, but the returns from a picked sample gave $240 per ton. The ore is hard blue quartz, similar to that found on the Good Luck and the Pick and Shovel, and is filled with streaks of black iron and bunches of pyrite. The mountain side has a slope of 30 degrees, so that the adit gains one foot in depth for every two feet advanced.

The mill on the Pavlak is progressing slowly, owing to the stormy weather. On the 4-M lease the new adit has entered the last discovered vein at a depth of 40 ft. below the point of discovery. The vein is here 7 ft. wide, and all of it is good ore, while about 4 ft. is fine-grained white quartz that pans well. This is the best showing yet opened by the successful 4-M. On the Ham And lease, sinking is continued with favorable results; the orebody is widening and the pannings are improving. Al. McCloy is sacking the fine stuff which he considers too valuable to dump.

On the Curley lease, the owner is still driving in a good body of milling ore. In this district is what is locally known as the Crater country. The name is misleading, as they are not volcanic craters, but are deep basins with abrupt walls enclosing them on the west and part of the north and south sides, while to the east they connect with East Fork by steep gulches. These basins are along the top of the range, and their almost vertical sides are due to the breaking down of the upturned edges of the strata which form the Jarbidge range. As this ridge is the backbone of this section of country, the vein system of the district, the crater vein, seems to have its centre along this ridge. There is no evidence in this district of active volcanic activity at any period. In the Crater locality the vein has been opened in many places where there is rich ore; it has been prospected and traced for more than five miles; up over peaks that attain an altitude of nearly 11,000 ft., and down 1500 or 2000 ft. into the basins. A large part of the way the vein is covered with slide rock which in places is very deep, but by following the strike of the vein it is again found.

Several companies are working up there this winter, and some of them have taken the precaution to lay in a lot of sacks with their other supplies, and a few are filling these sacks with high-grade ore. The managers of these companies believe that they will be in shape by spring to require mills, and plans are already made to start work, as soon as the frost begins to leave the ground, on a wagon-road from Three Creek direct to the Robinson cabin, on the East Fork, and up the East Fork to Fall creek, thence following the ridge two and a half miles to the mines. The grade to Fall creek will be gradual, from there to the

mines it will be steep, but it can be made a fair freight road at small expense. When these companies get ready for their mills they will be able to have it delivered where they want it without delay.

The True Fissure Gold Co. is one of the most active of these Crater companies. They had 60 days last fall from the time they took a bond on the property until the snow closed the pack trail, and in that time they organized their company, paid for the property, and got tools and supplies delivered at their camp to last until spring. A log-cabin was built and work started on an adit that is now in 50 ft. in fine ore all the way. The vein is from 2 to 7 ft. wide, of granular, soft, white quartz, with very hard porphyry walls. The adit starts from near the bottom of the basin and gains depth rapidly, as the average slope of the sides is 45°. Besides the main vein, there are three other north-south veins known to exist on this property, besides at least one cross, or southwest, vein. The cross-veins appear to belong to an older vein system, as they are cut by the north and south veins. Several of these cross-veins have been traced down into Snowslide gulch, where they have been opened on several claims.

A new find has been made eight miles southwest of Jarbidge where some rich gray copper-silver ore was found, but as it is mostly silver and is found in the lime, there has been but a small stampede to the place.

TORONTO, CANADA

Affairs at Nipissing.—Prosperity of La Rose.— Railroad Construction to Porcupine.

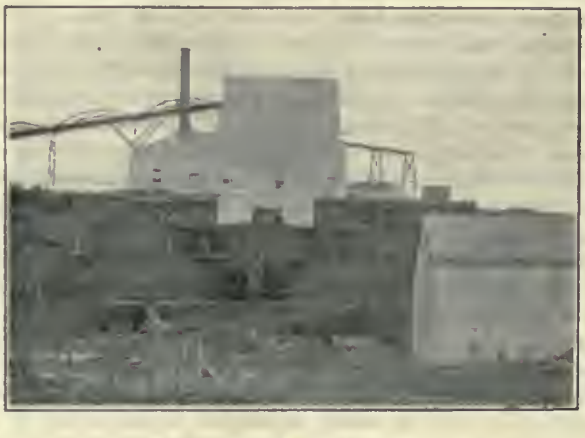
During December Nipissing mined 371,559 oz. silver of the net value of $201,022 and shipped ore to the value of $437,615 net. At No. 64, a vein from 10 to 12 in. wide of 1880-oz. ore, between the third and intermediate levels, has been blocked out for 55 by 40 ft. On the Meyer vein the winze being put down from the 175-ft. level is in good ore 1 to 2 in. wide. The La Rose shipped 417,000 oz. of silver in December, over 60% of which came from the Lawson property. The company is stated to have $900,000 in cash in hand and due from the smelters. A. P. Seymour, manager of the Cobalt Lake mine, has resigned, and will take a trip to Europe. He is succeeded by M. R. B. Gordon of the Little Nipissing. At the Bailey two new veins containing silver have been found at the 75-ft. level. The Silver Bar is to be sold, the company having made an assignment. An attempt at re-organization was made without success. The debts amount to about $36,000. The report of the City of Cobalt for the three months ended December 31 shows receipts for ore, $51,850, and a balance on hand of $28,525. At G. F. Webb's claim in the Gillies Limit, a vein 1½ in. wide carrying smaltite and native silver has been found on the surface and stripped for 150 ft. The total shipments from Cobalt during 1910 were 34,026 tons of ore, against 29,942 in 1909, which, considering that last year the camp had the advantage of cheap power and additional machinery, is hardly as encouraging as expected.

In the construction of the railway to Porcupine the working force has been increased to 500 men, and the steel is being laid. A real-estate boom is in progress, and considerable building is going on. The telephone line from Matheson to Porcupine is in working order. The Porcupine Exploration & Mines Co. has taken an option on three claims in Deloro, and will commence development. Two prominent South African companies, in addition to the Consolidated Gold Fields already there, are looking for properties in Porcupine. There are indications of renewed activity in the Elk Lake district, many of the properties in which had closed down. The Silver Alliance mill is to be put in operation again. Machinery is being installed at the Toledo preparatory to re-opening it in March. Preparations are being made to develop the United States mine. The Big Six has gone into liquidation. The Commissioners appointed by the Quebec Government to investigate the mineral resources of the Chibougamou district in the northern part of the province, including Alfred Barlow of McGill University, Montreal; J. C. Gwillim, of Queen's University, Kingston; and E. R. Faribault, of the Canadian Geological Survey, have presented their report, which is decidedly unfavorable. They state that they can not find that the mineral deposits so far discovered are of sufficient merit to justify the building of the projected railway from Lake St. John to that region. The orebodies contain gold, but not in a free-milling state in sufficient quantities to make stamp-milling feasible. The asbestos noticed in the working faces of the open-cuts, as well as on the dumps, was insignificant in amount and insufficient for their successful development as mines, and there is no probability of finding silver or cobalt. Eugene Haanel, Canadian Director of Mines, has returned to Ottawa from Vancouver, where a refinery has been established in connection with the Canadian mint. This will enable the placer miners of the Yukon to convert their gold into cash, without sending it to Seattle. J. M. Macoun, of the Canadian Geological Survey, who with his party of fourteen was wrecked last September off Wagner Inlet, Hudson Bay, and given up for lost, has arrived safely at Fort Churchill, having walked about 1000 miles.

JOHANNESBURG, TRANSVAAL

East Rand Debentures and Plans for Extension. — De Beers Diamond Output.—Giant Mines of Rhodesia.

An important debenture issue is announced by the East Rand Proprietary Mines, Ltd. The object of the scheme is to discharge the liabilities of the company to the National Bank of South Africa. The total issue is to be for £1,500,000. At the last annual meeting of the company Sir George Farrar, who presided, estimated that the indebtedness of the company at the end of the current year would be a little



Mill at Giant Mine, Rhodesia.

over £1,000,000, but, in fact, this amount has been exceeded by £232,310, and the total liability at present approximates £1,250,000. The loan from the National Bank was originally secured with the primary object of pushing the development of the company's huge property, and the excess expenditure is attributed to the further capital expenditure in increasing the capacity of the company's reduction plants from 2,100,000 tons per annum to 2,400,000 tons. There has also been a fall in the estimated profits, chiefly owing to delay in delivery of the machinery required for completion of the plant. The issue is guaranteed at 98% and is offered to shareholders at the same figure, thus allowing a yield of over 5%, and providing the company with £1,470,000. If the debentures are not converted into shares at £5½ and the company does not of compulsion redeem them, they will not be wiped out until 1929. After liquidation of the debt to the Bank it is proposed to devote the greater part of the balance remaining from the issue (about £236,000) toward underground development of the eastern parts of the property. The scheme is considered one of the most important that has ever taken place in the history of the Rand, and the issue will constitute the largest loan assumed by any gold mining company operating in South Africa. The an-

nual report of the De Beers Consolidated Mines, affording as it does the keynote of the diamond mining industry, makes interesting reading. During the 12 months ended June 30 last, De Beers sold diamonds realizing £5,414,895. Adding to this the sum of £176,272 brought forward from the previous year, and a quarter of a million pounds derived from sundry revenue, the grand total of receipts amounts to £5,843,265. The total ordinary expenditure amounts to £2,976,266, leaving a balance of £2,866,999. After payment of dividends, income tax, and blue ground stock account £728,325 is carried forward. It is interesting to observe that the stock of blue ground on the floors was reduced from 9,526,531 loads to 7,776,059 loads during the year under review. An examination of the company's statistics shows that on the whole a substantially better market for tne produce of the De Beers mines obtained during the year ended June last than in the 1908-1909 period. While there has been a falling off in the yield per load from the Wesselton and Bullfontein mines, there has been a marked improvement in the yield from the De Beers and Kimberly mines. The most hopeful features in the situation are, the improvement in the diamond market, and the great financial strength of the company. These two factors assure stockholders of a continuance of dividends, and should there be any truth in the rumor that the various diamond producing concerns in South Africa are co-operating with a view to maintaining the price of diamonds, the position will be much strengthened. The co-operation of the De Beers and Premier companies has so often been reported and denied that but little importance should be attached to the story until the De Beers company officially confirms the statement. A marked improvement has recently been exhibited in the affairs of the Giant Mines of Rhodesia, Ltd. The mine of this company is situated near Gadzema, in Mashonaland, and is the third largest producer in Southern Rhodesia, its output being exceeded only by that of Globe & Phoenix and Eldorado mines. The company has to date paid 60% in dividends on an issued capital of £250,000. The formation worked consists of a large body of schistose auriferous banded ironstone, and the reduction plant comprises 30 stamps and 3 tube-mills. For the first eleven months of the year 1910, the company has produced £122,000. The following figures relative to production for the past six months show an increasing improvement: June, £6578; July, £8434; August, £12,739; September, £14,362; October, £13,740; November, £19,069. The company's operations have been much hampered by a scarcity of native labor, and although the situation in this respect is better now than in the past, the efficiency of the labor leaves much to be desired. Owing to the development on the seventh level continuing to show broken formation, investigation by an expert has recently been made to determine the position of the orebody in the lower levels of the mine. The result of this investigation is said to be of a favorable nature.

MANHATTAN, NEVADA

New Mill for Manhattan.—Discovery in the Montgomery-Shoshone.—Tungsten in Nevada.

The so-called McNeill mill in the eastern suburbs of Manhattan, which has been running successfully for three weeks past, is of interest as showing what can be done in the way of extraction from a free-milling ore with a very moderate expenditure of money. The mill is situated adjoining one of the dumps of the Union No. 4 lode. The shaft from which the ore is being milled is now furnishing the water for the mill. From the dump the earthy and fine ore is trammed about 100 ft. to a crusher of the Dodge type, situated just outside the south wall of the mill building. Outlet from crusher delivers by spout to the boot of an inclined bucket-elevator which raises the crushed ore to the battery bin. Each battery of 5 stamps of the 10 employed is run by a separate 'bull-wheel,' connected by belt with a single counter-shaft, driven by an electric motor which furnishes the power for everything at the mill except the pump at the shaft, which is operated by a small separate motor. The batteries and plates present an antique appearance, as the former were built by the Miners Foundry, San Francisco, in 1865. The stamps weigh about 1000 lb. and drop 95 times per minute, and do good work. The output of the batteries, with fine screens and high discharge for Coast practice, is estimated at 25 tons per day. Stamp stems are kept in place and alignment by passing through built-up cross-beams of the battery frame instead of the usual modern forms of guide-blocks. The outflow of pulp through the screens falls into distributing boxes and thence through perforations to the plates, so the effects of splash and wave motion are mainly lost, and the flow over the plates is uniform and continuous. Inside amalgamation is practised, but there are no lip-plates. Apron-plates are a little less than usual size and divided transversely into three parts by two drops. They are also divided longitudinally by a wood strip in the middle, extending the entire length of the plates. Tailing from both plates flows through launders without intervention of amalgam and final tailing goes to waste. The mill is compact and simple in arrangement and was erected at low cost. Ore assays from $10 to $15 per ton and a high percentage of saving is made. The mill was erected and is managed by R. Wallace McNeill.

Clement Millward, R. Pritchard, Edward Bevis, and others have a lease on the entire Eclipse vein of the Tramp and propose to sink, drift, and cross-cut from the present lowest point in the mine. The finding of a new and large body of ore in the Montgomery-Shoshone Consolidated has stimulated leasing in the Bullfrog district as well as the usual re-location work of the New Year period.

At Johnnie the Nan, Runaway Girl, Howitzer, Primero, Blue Bell, Anna M., Golden Eagle, and Tripod claims adjoining the Johnnie Consolidated on the southwest have passed to the ownership of the Eureka-Johnnie Gold Mining Co., organized and controlled mainly by French capital. The property was formerly owned by the Nevada Johnnie Mining Co. A strong vein, believed to be the continuation of the Crown Point, is exposed for nearly 1000 ft. on the Blue Bell claim, and has been developed by a 125-ft. adit and two shafts each 50 ft. deep. The vein has yielded at times very rich ore. A well defined vein, supposed to occupy a cross-fissure from the main Johnnie to the Crown Point vein, is found on the Golden Eagle, and has been developed by two shafts 50 and 128 ft. deep respectively. The erection of a mill is contemplated during the present year. Charles Labbe and M. C. Labbe, of Los Angeles, are president and secretary, respectively, of the company, and Abe Campbell, formerly a foreman at the Copper Queen mine, at Bisbee, Arizona, is superintendent.

It is a fact of interest that after many years one of the many tungsten deposits in Nevada is being put in shape for production. It is near Mt. Wheeler in Snake range, 45 miles southeast of Ely. The large group of claims is owned by the United States Tungsten Co. The main vein crops on the side of a hill for a long distance and has been opened in many places by shafts and adits. Other veins on the company's ground have had considerable development. A concentrating mill of 100 tons capacity is well under way. It is equipped with crusher, coarse and fine rolls, Wilfley tables, Isbell vanners, and other machinery. Power for the mill, as well as water for concentration, is obtained from Williams creek through a ditch 6000 ft. long. Other water is obtained for concentration and other purposes from springs a short distance north of the mill. A steam plant is also installed at the portal of the main adit to operate compressor and furnish power in event of partial failure of the water supply. The ore, in the form of hübnerite and scheelite, contains from 1 to 50% of tungstic acid, worth about $8 per unit. A reduction in freight rates on concentrate has been obtained from Ely to New York City, to which place the first output of the mill will soon be shipped. F. L. Fletcher, of Ely, is general manager. The mill was erected under supervision of Thomas L. Mitchell.

NEW YORK

Wall Street and the Public.—Copper the Centre of Attention. —Again the Merger.

The situation in the East is peculiar. The inertia which prevails seems to be partly dispelled, from time to time, only to again overcome all the headway gained. New York is the financial centre of the country, and, as such, has centralized its power in this direction as much as possible, only to find that this very centralization has in a way circumvented Wall Street's own ends. The public was a long time learning that its contributions to Wall Street were largely looked upon as 'sucker money', but, having learned that its only rôle was that of victim, the public is staying away with a consistency that is breaking the heart and pocketbook of the brokerage houses and promoters. Perhaps these will wake up some day to the fact that the public is demanding a new deal, and that until that new deal is offered with an ample guarantee of honest treatment, the public will continue to be very much engaged with its own affairs. After a long, hard struggle, the organization of the Curb is in sight, and the traders are to go under a roof; financial responsibility is to be, to a reasonable degree, insured, and the undesirables eliminated, as far as possible. The leading element in mining in the East, at this time, is copper. The copper situation is receiving a great deal of attention. There never has been accorded to any line of industry a more enthusiastic general support than has been given to copper. The output of various properties and the figures of the Producers' Association are studied carefully. Just now the copper situation is not encouraging, and the leading issues have shown declines since the beginning of the year, while the price of the metal has recently been reduced to 12½c., and heavy sales made at this figure by the leading agencies. Mining progress seems to have little or no effect upon the general attitude of indifference. As an instance, the revolutionizing of Greene-Cananea, the rebuilding of almost the entire plant, and a substantial reduction of operating costs has not bettered market conditions appreciably. Greene-Cananea staggers under the weight of a gross overcapitalization, but it is selling for less than one-third of its face value, and is without public support. The stockholders of the Calumet & Arizona are to meet on February 15 to authorize the increase in the capital stock, which is necessary to provide for the absorption of the Superior & Pittsburg. The authorized capital of the Calumet & Arizona will be increased from $2,500,000 to $6,500,000, and, when the outstanding stock of the Superior & Pittsburg shall have been exchanged on the proposed basis of 3½ shares of Superior & Pittsburg for one share of the new company, the new company will have outstanding $6,285,710 of its total authorized capital of $6,500,000. The Shattuck Arizona bids fair to become one of the leaders of Boston copper-share market. The company announces that notwithstanding its intention to build a new smelter, its regular quarterly dividend of $1 per share will be continued. The Shattuck ores are sent to the Copper Queen smelter. The company reports officially that its ore reserves are estimated at 17,000 tons of 17% ore and 600,000 of 6% ore, with only a small fraction of its territory proved. The Ray Central situation has not been cleared up as yet. The report made by Weed & Probert is not to be made public until early in February, but preliminary estimates are said to give the property about 6,500,000 tons of 2.15% ore, which can be handled at a profit of $1 per ton. Development, as planned, includes further work on some of the ground only partly explored. These estimates do not show the property to be as good as the first estimates made by J. Parke Channing, at the time when the property was under option to the General Development Co. The Tennessee Copper Co. has made a contract with the International Agricultural Corporation, by which the latter takes all of the output of Tennessee's sulphuric-acid plant for the next 10 years. The Tennessee Copper Co. is making 150,000 tons of acid per annum, but this is to be increased to 225,000 tons. Copper merger rumors have been much overworked during the past six months or more. There have been so many preliminary steps taken, each of which has been heralded as the immediate forerunner of the expected world-wide combination, that the public has become used to the sensation. Following the Calumet & Hecla merger, comes an equally sensational story to the effect that all of the Guggenheim interests are to be amalgamated into a holding company modeled after the United States Steel Corporation. Such an organization would include the American Smelting & Refining Co., the American Smelters Securities Co., the Yukon Gold Co., the Utah Copper Co., the Guggenheim Exploration Co., the Federal Mining & Smelting Co., the Nevada Consolidated Copper Co., the Braden Copper Co., and in all likelihood the Ray Consolidated, though the latter is probably not so completely a Guggenheim property as the others mentioned. Stockholders of the Giroux are becoming restive under the treatment they are receiving. It has been the rule for all of the developing properties to publish frequent statements as to the amount of developed ore proved, and the Giroux shareholders are asking why they cannot have some equal knowledge in reference to their property. Figures are available showing the production of the Utah Copper Co. and the Nevada Consolidated for the past year. The Utah Copper Co. made 80,019,596 lb. of copper at a cost of 8.11c. per pound. The Nevada Consolidated produced 65,500,590 lb. at a cost of 7c. per pound. Nevada Consolidated encounters some occasional high-grade streaks of ore which materially increase the percentage of the whole output. Recently in removing overburden from the new pit on the Liberty claim, commercial ore was found and ten carloads were sent to the smelter. Some 6% ore has been found in the Copper Flat pit, and while these seams have been too irregular and uncertain to be taken into account in estimating ore reserves they have materially improved the general average of ore treated. The Mines Company of America has granted a 60-day extension of time for the exchange of stock of the Dolores and El Rayo companies. More than 91% of the stock of both of these companies has been turned in under the merger plan. The present Mines Company of America is now paying dividends on a basis of 9% annually; 2¼% quarterly. The bondholders of the Hinds Consolidated Co. are to foreclose upon the property, which is situated in Chihuahua, and after acquiring the property at judicial sale will organize a new company to operate the mines.

Cobalt's 1910 figures are interesting as being probably the banner year for that camp. Total production up to and including 1910 is figured at 92,407,168 oz., of a net value of $48,384,000; 1910 output is estimated at 29,000,000 oz., an increase over the year previous of 3,000,000 oz. These figures indicate that Cobalt produced in 1910 more than 13% of the world's entire output. Cobalt's claim to distinction rests not so much on the gross production of the camp as on the small initial expenditure which has been made and the tremendous relative proportion returned in dividends. Of the $48,384,960 produced, there has been paid in dividends to the public $22,127,318, while to this must be added at least $4,000,000 paid to the holders of properties which were for a time operated as close corporations.

It is thought in the East that certain interests in Goldfield Consolidated did not like so frank a statement as was embodied in the report by J. R. Finlay and for that reason forced his resignation. The question of ore reserves, future life, and general conditions underground has been the point of discussion in the big Goldfield property for some months. The public has wanted to know, and, not being informed, has gone out in large numbers. The recent action in changing managers has not to any extent restored confidence, though there is no question made of J. H. Mackenzie's position in any way. It is detailed frankness that is demanded, even more than a continuance of the present handsome rate of dividend return.

General Mining News

ALASKA

Following the run of the rock of Goyette & Jacobson, from Fairbanks creek, the plates have been cleaned and the amalgam retorted. The gold was valued at $225, which is at the rate of $74 per ton. No test of the tailing has been made to determine what percentage of value went over the plates and concentrator. According to a report received at Fairbanks, Shaughnessy & Butler have struck a rich streak of pay dirt on Winworth creek, in the Hot Springs district, in a hole 12 ft. deep, where they found three feet of dirt that will average 7c. per pan. Winworth creek is a tributary of Sullivan, coming into that stream about a mile above the mouth of Fish, which was the scene of a stampede last fall. The mouth of Fish creek is nine miles below Kelly & Anderson's road-house. At present there are only five men in the vicinity of the strike, but others will be attracted there by such a report.

ARIZONA

COCHISE COUNTY

The Tombstone Con. M. Co. has leased the dump of the Toughnut mine to J. H. MacPherson. The ore is to be sent to El Paso for treatment.

GILA COUNTY

A vein of rich ore, said to average 20% copper, is reported to have been struck by the Summit Copper Co. at 400-ft. level. This company has an option on the Gibson mine which produced high-grade ore some time ago. The company expects to start shipments to El Paso in a short time.

The Live Oak Development Co., near Globe, has done 4039 ft. of underground work, but since July 1, 1910, has been using a churn-drill for exploration. By this means 1795 ft. of drilling has been accomplished. The company has developed 6,000,000 tons of ore averaging 2.25% copper and partly developed 3,000,000 tons of ore averaging about the same.

The business portion of the town of Winkleman was destroyed by fire on the morning of January 25.

MOHAVE COUNTY

A. W. Howitt and assistants are sampling the Gold Road mine, it is said in the interest of the United States Smelting, Refining & Mining Company.

YAVAPAI COUNTY

It is reported that the Octave mine, near Wickenburg, will soon resume operations under the management of E. W. Carpenter. Erwin Gillis, of Kalamazoo, Mich., paid a visit to the mine this week.

E. Haney, who has been developing the Alta mine, three and one-half miles south of Iron Springs, has found silver ore. Assays from a 6-in. streak gave 407 oz. per ton. The silver is associated with antimony. The ore was found 100 ft. from the mouth of the tunnel.

A bar of gold bullion valued at over $1700 was received by the Prescott National bank from the Tiger Gold company at Harrington, the result of a few days' run of the mill. With this yield, R. H. Hetherington, ore buyer representing the El Paso smelters, reported that a carload of concentrate valued at $2000 had been delivered to him.

YUMA COUNTY

(Special Correspondence.)—Chalcopyrite has been found on the 300-ft. level of the Signal mine of the Clara Consolidated Gold & Copper Mining Co., at Swansea. Since the discovery the ore has been developed by a 40-ft. winze and a 55-ft. drift. The ore carries from 5 to 7% copper and 25 to 30% sulphur. No cross-cutting has been done so that the width of the ore is not known. Drill-hole No. 13 has entered sulphide ore at a depth of 350 ft. This discovery is of importance, not only for the Signal mine, but for contiguous territory in what is known as the Bill Williams country, where surface indications are good but with little development at depth. H. Leew, a French engineer, has been at the Signal mine for the past three weeks making an examination of the property. His report will be made largely in the interest of the French stockholders of the company.

Parker, January 20.

The Steece Copper Co. has done over 3000 ft. of development on its claims and is making preparations to ship some of the ore to smelters. Judd & Moore have 22 miners employed on their claim 8 miles south of Vicksburg and expect to ship soon. Nine miners are working at Alamo, 9 miles south of Vicksburg, where a rich body of gold ore is being developed. Frank Whisman and the Shannon brothers are sinking a shaft on an extension of the Alamo, a recent discovery, and have several tons of high-grade ore. It is reported that the McEntee brothers have sold their Shamrock mines near Vicksburg to D. G. Lorenzo of San Diego, California. The principal shaft is 150 ft. deep. The ore carries gold, some of it being of shipping grade.

CALIFORNIA

AMADOR COUNTY

On the 1950-ft. level the Bunker Hill mine has been opened for a length of 500 ft. and the vein found to be about 20 ft. wide. The mill has recently been enlarged by the addition of 20 stamps. The mine has been a steady dividend payer for five years or more. The Argonaut company will place a 500-hp. electric-hoist at its shaft. It is reported that the Amador Queen No. 1 mine, near Jackson, will be re-opened. The 1200-ft. shaft will be unwatered and east and west drifts extended. The property was recently bonded to C. D. Porter of San Francisco. The South Eureka shaft has been placed in good condition and operations have been resumed. During the period of repairing, the company has paid regular monthly dividens of 3 cents per share from the treasury reserve. The Kennedy continues its normal output. Good ore is being mined in the vicinity of the 3500-ft. level, and recent developments have proved satisfactory. The 100-stamp mill is operating steadily.

IMPERIAL COUNTY

J. A. Gallagher and J. P. Gaskell of Yuma have been investigating mines in the vicinity of Picacho basin, 30 miles north of Yuma, with the idea of forming a consolidation of a number of mines there and undertaking their development.

INYO COUNTY

(Special Correspondence.)—The Skidoo Mines Co., operating in the Panamint range, reports for the first half of January 1911 a clean-up amounting to $7500. From 10 to 12 of the 15 stamps were in operation in this period. Supplies have been ordered for the resumption of cyaniding next month. A 2½-ft. vein, averaging $25 per ton in gold, has been uncovered on the 200-ft. level.

Skidoo, January 26.

KERN COUNTY

(Special Correspondence.)—The Jade Oil Co., operating in section 15 of the Midway field, west of Taft, has sublet practically all of its territory to seven lessees, royalties ranging from one-eighth to one-quarter. The S. K. D. lease is down 2200 ft., and expects to get into oil sand within the next 100 ft. The Penn-Midway lease is down 2260 ft., 150 ft. of which is in oil-bearing formation showing heavy gas pressure. The well on the Kewanee lease has reached a depth of 1750 ft. On the Alvarado lease (Union Oil Co.) No. 1 and 2 wells are down 2500 and 1600 ft. respectively. There has not as yet been any production from the leases of the Jade company, but it is expected that several wells will come in at about the same time. Two additional lessees of 40-acre tracts will be drilling within 30 days.

Taft, January 28.

NEVADA COUNTY

(Special Correspondence.)—A careful estimate of the yield of Grass Valley mines for 1910, from data available

at this time, places the production at approximately $2,500,000. Of this amount, the North Star is credited with $1,250,000, the Empire with $1,000,000, and the Pennsylvania-W. Y. O. D., Union Hill, Idaho-Maryland, and one or two small properties with the remaining $250,000. It is possible that the Empire production is rated somewhat too high, but it is believed that it is approximately as given. Sinking is progressing from the 1400-ft. level of the Pennsylvania, and it is expected that new orebodies will be uncovered. On the 700-ft. level a winze is going down and is reported to have entered good ore. A new electric motor was recently installed. Seventy-five men are employed, and 15 stamps are operating steadily. Bennett Opie is superintendent. Sinking at the Cincinnati Hill mine is progressing day and night. It is rumored that good ore has been found. This work is being done by the North Star company. At the Sultana, recently acquired by new interests, vigorous work is under way. Richard Barry is in charge of operations. The ditches and flumes supplying the Empire and other mines with water have been repaired, and all the affected properties are again working full-handed. A 3-ft. vein of milling ore has been struck in the Alaska mine. George St. John is manager. Dan McGonigal, of the Coan mine, reports that the new 10-stamp mill will be ready

Champion Mill, Grass Valley, California.

about February 15. The hoisting and pumping plant has been completed, and the two-compartment shaft is being sunk to the 300-ft. point. The Norambagua mine is being examined. It is said that San Francisco people are interested. The Pittsburg Mining Co. has purchased the 10-stamp mill, Blake rock crusher, and other machinery at the Reynolds mine, near Brandon, El Dorado county. The plant will be installed at the Pittsburg mine immediately. This will give the property 20 stamps. Mark B. Kerr is manager. Operations will be resumed at the Eagle Bird as soon as spring sets in. This property is near Washington. It is planned to install a 20-stamp mill, hoist, and pumping plant. It is stated that the main vein at the Fruitvale is 12 ft. wide, with only one wall exposed. It is planned to build a 10-stamp mill at an early date.

Grass Valley, January 30.

(Special Correspondence.)—A six months' option on the Champion-Providence group of mines near Nevada City has been given to an Eastern capitalist. Work is to be continued uninterruptedly by the company pending a thorough investigation by the prospective purchaser. This is one of the largest and most important groups of mines in the Nevada City region.

Nevada City, January 28.

SIERRA COUNTY

It is reported that a 3-ft. vein has been found in the Alaska mine at Pike City. It is said to be the best yet discovered in the property by the present company. It was found within 5 ft. of where work had previously been abandoned. The Alaska company has expended over $200,000 on the property since taking hold of it six years ago. The Alaska has a modern equipment and a new vertical shaft has been sunk to a depth of 750 feet.

TUOLUMNE COUNTY

The Green Spring mine, on the Stanislaus river, near O'Bryne's ferry, has been bonded by the Meuli brothers of Mountain Pass. The property is equipped for development work and for testing the ores. A small force has been put to work.

(Special Correspondence.)—Operations are to be resumed at the Carlotta and Pennsylvania mines, north of Tuolumne, the properties having been bonded to John Oleson, of San Francisco. Within the next two years 600 ft. of sinking and 400 ft. of driving must be done. This will include work in both shafts until they have reached a depth of 500 ft., when they will be connected. A new head-frame will be erected. A company has taken a bond on the Butler group of mines, in the Buchanan district and owned by Benj. Darmert and D. J. Sutton. A substantial payment has been made by the purchasers, and the balance is to be paid within one year. The veins have been opened by adits and a large quantity of ore has been profitably worked in an arrastre. It is probable that modern machinery will be installed by the new operators. William Bingham a prospector, has discovered, in an old mine in the vicinity of Confidence, a vein of rich ore. According to reports, a streak in the vein a few inches wide will go hundreds of dollars per ton. It is understood that the management of the Tarantula mine, near Tuttletown, will add 20 stamps to its mill, making 40 in all, and that before the end of the year the plant will be increased to 100 stamps. A number of buildings are under construction. Ore is being milled. A promising claim, known as the Duke, is being developed near Parrott's ferry by Otto Kanig. The vein is 30 in. wide and assays show the ore to be of good and uniform grade. The Duffield-Sonora Mining Co., with a capitalization of $100,000, has filed articles of incorporation in this county. The directors are Paul and Stepheno Lavagnini and Joseph Sanguinetti. The properties held by the new corporation are the Sonora and Duffield mines, near Arastraville. Much development has been done during the last year, and a 10-stamp mill is about completed.

Tuolumne, January 28.

COLORADO

CLEAR CREEK COUNTY

(Special Correspondence).—Work was resumed this week upon the Flat Iron property, on Democrat mountain. The shaft will be sunk 75 ft. A contract will be awarded to drive the McKinley adit on Lincoln mountain. Driving will also be started. The crew at the Vidler tunnel in East Argentine is to be doubled. It will be necessary to drive 1700 ft. to furnish an outlet for the ore from the western side of Argentine pass. A contract will be awarded during the next week to drive an adit 100 ft. on the Ohio property in West Argentine. C. Howard is manager. Heavy shipments are coming from the Gold Dirt mine on Covode mountain. Most of the work is being performed by lessees. The Gold Fissure mine is one of the steady producers of the Empire district. The ore is being sent to the Golden smelter. Willis Bristol is manager. Maxwell & Davis, owners of the King and Queen claims on McClellan mountain, have started development. W. C. Hood, owner of the Eclipse adit on Saxon mountain, has started development. The Virginia City adit on Lincoln mountain is now within 80 ft. of tapping the 500-ft. level of the shaft workings. Work is being carried on under the contract system. John Owen, of Idaho Springs, has secured a sublease from the Gem Gold Vein M. Co. on the Belman vein. Driving has been started to the west. Development has begun on the Silver Horn mine on Ute creek. F. E. Wire is manager. Work has commenced at the Lee mine at Dumont after an idleness of eight years. R. N. Curtis of Brookiyn, N. Y., is owner. It is said that a streak of copper-lead ore 6 in. wide is exposed on the 150-ft. level that will mill from $60 to $70 per ton. A force of 25 men is employed on the Stanley mine, under management of J. J. May. An average of ten carloads of smelting and concentrating ore is being shipped monthly. Shipments have been started from the Little Giant mine on Red Elephant mountain. The ore

mills from 450 to 500 oz. silver per ton. J. A. Young is manager.

Georgetown, January 23.

GILPIN COUNTY

(Special Correspondence.)—A. Rollins & Co., of Idaho Springs, have taken a bond and lease on the First National Kansas mine, situated on Quartz hill. Work has already been commenced on the 600-ft. level. The Hayseed adit on Quartz hill is now in 625 ft. The last shipment of ore brought a settlement of 0.52 oz. gold, 12 oz. silver, and 44% lead per ton. F. Fry is owner. A streak of ore 8 in. wide has brought returns of $40 per ton in gold, silver, and lead. Driving has been started on the Ingleborg east from the 114-ft. level. The Victor is being developed by Gus Meyers. The adit is in 130 ft., with a streak of mineral exposed that is 2 ft. wide, the average value of which is $12 per ton. Smith & Sidown, operating a small concentrating plant on Gregory street, are handling a fair tonnage of ore. It has been decided to purchase another Wilfley table. Reese & Co., leasing on the 600-ft. level of the Saratoga mine, shipped 30 tons of ore last month that milled $18 per ton. The Washington adit on Fall river will intersect the Tomahawk vein within the next 30 days. The work is being performed under contract by G. Minier. Shipments have been started from the Columbia adit on Quartz hill. The first-class ore mills $80 per ton in silver and gold. A shipment of 14 tons of ore from the Victor mine returned $41 per ton. Schuh & Ham are operating under lease.

Central City, January 22.

LAKE COUNTY

The Colonel Seliers mine, one of the oldest properties on California gulch, Leadville, for several years has been in control of the Empire Zinc Co., a subsidiary of the New Jersey Zinc Co. When the demand for zinc became active a few years ago, this company shipped ore, that had accumulated on the Colonel Seliers dumps, which is said to have yielded a net return of $350,000. Much of this ore is sulphide. Within the last six months the work of the company has centred on sinking a new shaft, opening drifts, and cutting stations; levels from the new shaft have been connected with other workings, and the conditions and equipment are such that the production of ore soon can be brought up to 500 tons per day. Steel ore-bins have been built from which the ore is to pass through gates into cars; these are the first steel bins erected in the district. Mr. Bergler has charge of the property, while J. H. Troutman and E. W. Kieth are closely identified with the company. A plant for concentrating zinc ore and separating zinc from iron is operated at Canon City.

SAN JUAN COUNTY

Work has been resumed at the Ledge Consolidated mine near Silverton with a force of 35 men, and development work will be vigorously carried on until spring, when the company will start the mill. Louis Sleade and John Schrader have taken a lease on the Esmeralda and are breaking ore in the upper levels. The wagon-road will be cleared and a shipment made. The Iowa-Tiger continues to make an excellent showing and concentrate is running better than 1 oz. gold and 10 oz. silver. A small slide struck one of the upper buildings last week but no damage was done and no one was injured. The railroad was opened to the Ledge last week and several cars of coal and supplies taken up.

SUMMIT COUNTY

The Vidler tunnel is being driven at the rate of 175 ft. per month. A new ore roaster will be installed at the Lowell mill at Idaho Springs. The company has erected a 20-ton mill at West Denver. In addition to these two mills, the company has given contracts for the building of two more mills.

TELLER COUNTY

The Cripple Creek Drainage & Tunnel Co. is contemplating a third deep drainage adit to still further lengthen the life of mines in that camp. The stockholders of the company, composed in most part of the owners of all the big properties in the district, held a meeting last week and instructed T. R. Countryman, supervising engineer for the company, to make a report on the new project, and it is expected that he will furnish facts and figures at the next meeting of the directors of the tunnel company to be held in February. Already the matter has been given careful thought, and the investigations thus far have supplied valuable data bearing on the future of the gold camp.

IDAHO

SHOSHONE COUNTY

(Special Correspondence.)—The recent find at the Jack Waite mine is one of the most important made in the Coeur d'Alene in many years. Where the cross-cut was made there is 5 ft. of ore, 2 ft. 7 in. of which is clean shipping galena which will go from 75 to 80% lead. The adit will have to be driven 80 ft. to get under the surface showing. Patrick Burke, manager of the mine, reports that the face of the main drift, now in 1000 ft., shows 18 in. of solid galena in a big body of concentrating ore, at a depth of 400 ft. from the surface. The face of the drift now lacks only about 40 ft. of being vertically under the beginning of the great ore outcrop, which is 500 ft. long and from 2½ to 6 ft. wide. The Carbonate Hill Mining Co. has made what seems likely to develop into an important find. In a cross-cut to the south from the main tunnel, at a depth of 700 ft. from the surface, a 20-ft. vein has been cut which shows a streak of good galena on both walls. One of these streaks is 15 in. wide and the other 20. They assay from 14 to 27% lead and 6 oz. silver per ton. The Terrible Edith mine, near Murray, has been bonded by T. D. Farrow of Butte, Mont., for $250,000. Ray Shannon, who is in charge, reports a drift of 40 ft. in the ore and a raise of 25 ft. The orebody in both the drift and raise is 4 ft. wide, one-half being shipping ore and the other concentrating ore that will average more than 20% lead. This mine differs from almost every other silver-lead mine of the north side, as it carries gold and silver as well as lead. Twenty inches of galena shows in the face of the drift on the Dalamatia Mining Co.'s vein near Kellogg. The adit has been following ore for months, but a few days ago the vein suddenly widened. It assays 65% lead and 80 oz. silver per ton.

Wardner, January 25.

MICHIGAN

HOUGHTON COUNTY

South Lake has stopped No. 8 diamond-drill hole at a depth of 740 ft., and No. 9 hole has been started 200 ft. north. It will be perhaps 500 ft. and the last one sunk below the vein. After that the preliminary sandpiping for the actual shaft will be undertaken. There will be no assessment. The policy will be to dispose of a part of its treasury stock, when market conditions warrant.

A committee consisting of H. L. Higginson, H. H. Gay, and S. B. Pearmain has been appointed by the Boston Stock Exchange to examine the proposed Calumet & Hecla copper merger plan. Boston papers state that it is the desire to ascertain whether or not the minority stockholder interests are being fairly treated in the deal. One thing should not be overlooked in this connection. When one company corrals six or a dozen other propositions, many of which are active traders on exchange, such action removes them from all possible future market activity.

MISSOURI

JASPER COUNTY

Good ore continues to be mined at the 80 and 90-ft. levels at the mine recently re-opened near the Missouri Pacific depot in Carthage. The three hand-jigs recently installed have piled up a carload of cleaned ore. The development of this mine is watched with great interest and several people are thinking of starting development in the vicinity in the near future. Drilling in that locality at several points has shown good ore.

NEVADA

ELKO COUNTY

Lack of water is said to be all that prevents the Gold Circle district from becoming a big placer camp, for pannings of gold are to be had almost anywhere within the camp. Some inventive geniuses of Gold Circle have nearly finished a dam intended to provide enough water for placer operations, and while the mine owners are awaiting easier financial times, they can try the old-fashioned method of digging gold from the soil. The Hardscrabble lessees are reported to be taking out some very rich ore from a new streak.

ESMERALDA COUNTY

The annual meeting of stockholders of the Florence-Goldfield Mining Co. will be held at the office of the company in Goldfield on Wednesday, March 1, at 10 a. m., for the election of directors for the ensuing year and for the transaction of such other business as may come before the meeting. Books for the transfer of stock will be closed 20 days prior to the date of the annual meeting, and remain closed until final adjournment. The annual report by Willis Lawrence, manager, shows that 55,000 tons of ore has been mined having an approximate value of $600,000. The mine had been systematically gouged by lessees, as far as development had gone, which necessitated much new work. The shaft was retimbered from the 350-ft. level to the surface, and a raise driven from the 500-ft. to the 350, thus completing the shaft to the 500-ft. level. Additional sinking has carried the shaft to nearly 700 ft. in depth. New development on the 600-ft. level is showing some very good ore, and indications are that the Florence will yet make a large and valuable mine. The mill is handling an average of about 130 tons per day, but has been somewhat handicapped by a shortage of water. While new ore reserves are being opened on the new levels, the mill will continue to be run on ore mined from the levels that have been supplying the tonnage for months past.

LINCOLN COUNTY

The Ploche merger was consummated in New York on January 27. The Amalgamated Ploche Smelters Corporation, the holding company, is to be incorporated in Maine, with a capital of 1,000,000 shares, par $10. Under the terms of the merger title to all the properties owned by the Prince Consolidated, Consolidated Ploche, and the Ohio Kentucky will be transferred to the Amalgamated Ploche. The latter corporation, in the acquisition of these properties, will be called on to issue not more than 700,000 shares of its authorized capital, and of this amount issued a majority will be held in the treasury of the Nevada-Utah Mines & Smelters Corporation, so that besides retaining ownership in the major portion of its own properties in the Ploche and other districts, the Nevada-Utah acquires a majority interest in the very rich and potential properties owned by the Prince Consolidated, Ohio Kentucky, and Consolidated Ploche companies. This is made possible by the fact that in connection with the merger the interests now dominant in Nevada-Utah, headed by the president, Ernest R. Woolley, have provided $500,000 cash which is now on deposit in a New York bank, but which is to extend the Ploche Pacific railroad to the Prince Consolidated mine and erect a mill at Ploche of 500 tons daily capacity.

LYON COUNTY

As an example of the difficulty of determining the position of some of the orebodies of the Mason valley mines, it is stated that often the workings have passed within a few feet of important shoots without the slightest indication of ore being near. One of these experiences happened at the West End orebody, where a drift passed within 7 ft. of the shoot and it was not discovered until six or eight months later. The finding of the orebody on the intermediate, below the fourth level, and of the shoot more recently opened in the southeast portion of the property on the third level, are among other instances of this kind. In the former case driving had passed by the shoot and it was not until a complete turn was made to the eastward that the orebody was picked up. While in the latter, notwithstanding that development had been carried on in the vicinity, the main haulage level passing within a short distance of the shoot, it was only when cross-cutting was done to the eastward that this important orebody was discovered.

NYE COUNTY

Production of the Tonopah mines showed a slight falling off the last week of January but it is estimated at $190,000, which is close to the recent general average. The Tonopah Mining Co. produced 3200 tons, the Belmont 2057, Montana-Tonopah 1057, Tonopah Extension 980, West End 375, and Midway 50, making a total tonnage of 7719. The new surface plant of the Belmont is in operation at the new Belmont shaft, the Desert Queen shaft being practically abandoned. The new shaft is centrally situated for present operations, and shorter distances in tramming will reduce mining costs. All of the mill ore is being shipped from the new bins and the smelter ore will also be sent from these bins as soon as the ore-washing plant can be removed to the new site. Underground operations continue along the usual lines. Some of the new cross-cutting is opening promising bodies of ore. At the Tonopah mine new development has been satisfactory, as several new bodies of ore have been found. The largest of these was found in the Red Plume ground and is being developed through that shaft, which is the most westerly now in operation on the Tonopah Mining Co.'s ground. Meantime stoping continues in the older workings on the Mizpah and Valley View veins, which are furnishing the bulk of ore at present, and they will continue to do so for some time to come, leaving the newer orebodies as a reserve. The customary development in the Montana mine is being continued, and a number of parallel veins are being opened and new orebodies found. The most interesting prospecting work at present is the winze from the north cross-cut on the 765 level, about 1000 ft. north of the shaft, for the purpose of prospecting the body of earlier andesite that was cut some time ago by the diamond-drill. The general condition of the mine continues satisfactory, with a large tonnage of ore exposed in the older workings, while the new work is continually adding to the reserves. Little change is noted in the Tonopah Extension. The bulk of the new work is being confined to the westerly workings on the 500-ft. level and pushing the long cross-cut out on the 600 to get under the workings on the 500-ft. level. Two or three promising veins have already been cut, but no driving has been done. Stoping is in progress on the south vein in various levels, the general average being about 4 ft., and in some places widening to 6 ft. Development is being carried on in the Midway, principally in the northern part of the ground, where a favorable formation has been entered. There is also some work being done in the southern end of the property. A small production is being made from various places in the mine, the output for the past week being 50 tons. A station is being cut at the 800-ft. level in the Rescue-Eula shaft, and cross-cutting to the northeast will be started as soon as the station is completed. A new compressor has been installed and machine-drills will replace hand work. Good headway is being made with the cross-cut on the 600-ft. level of the Jim Butler, which is now over 300 ft. from the shaft. It is being driven to reach the ground east of the Stone Cabin fault.

The Belmont Extension has nearly completed its surface plant, the Rescue has its shaft sunk nearly to 800-ft. depth, the North Star is still idle, as is also the Halifax, the last named being at the east end-line of the Belmont and in the vicinity of the recent developments in the latter. In the Tonopah Extension the drift on the 500-ft. level, at 900 ft. west of the shaft, has reached the vein found in a similar drift on the 400-ft. level. The vein on the 500-ft. level is much stronger, but the ore is variable in value. A drift on the 600-ft. level is being advanced to intersect the same vein, this being the farthest west of any milling

ore found in the camp. The vein recently found in the west workings on the 400-ft. level of the West End mine contains good milling ore. The Montana's search for ore in the most northerly workings of the camp resulted in finding ore in a winze sunk from the 765-ft. level, at a point over 1000 ft. north of the shaft. Further development is in progress to prove its economic worth.

Tonopah, January 20.

STOREY COUNTY

The annual meeting of the Silver Hill Mining Co. will take place the last Monday in May, and it is understood that a movement is under way to consolidate this mine and the Overland, near Silver City, to work them jointly and at greater depth.

WHITE PINE COUNTY

A depth of 520 ft. has been reached in the Zack shaft of the Ely Consolidated and a still larger body of ore has been discovered that was not previously known to exist there. The last 10 ft. of the shaft is in the solid body of ore that carries a good percentage in copper.

NEW MEXICO

GRANT COUNTY

During the month of December approximately 835,000 tons was added to Chino's ore reserves, of a grade approximately equal to that of the whole tonnage of December 1, 1910, based on the new estimates of the steam-shovel engineers, namely, 2.32%. For many months past, two separate calculations of ore reserves have been made at the Chino property. The first estimate, and the one which has been made public each month, takes as the lower limit of the ore on outside boundaries 1.5% copper, while the steam-shovel method of calculation includes some below this figure. The steam-shovel estimate is also based on the total tonnage of both shovel and underground ore on the property, and allows for the ores which will probably be worked out in actual practice by shovels; that is, the boundaries between waste and ore in the latter method have not been so clearly defined as in the first estimate, but the tonnage includes in many places tongues of overburden which extend into the ore, and which, in practice, will be found to give better results to mine with the ore than to attempt to separate; consequently, the tonnage has been increased and the grade decreased.

SOCORRO COUNTY

(Special Correspondence.)—In excess of 38,000 oz. of gold and silver bullion was smelted in December from 2800 tons milled at the Socorro mines. Although the tonnage was unusually low, the grade of ore was good and the recovery excellent, being 93% of the gross value of the ore. Eight large bars of bullion were shipped during the first half of January. The Ernestine Mining Co. milled 655 tons of ore during the week from which were produced 54 sacks of concentrate and the usual quantity of precipitate which is being smelted. An examination of this property has been completed, a corps of engineers having been engaged the past 6 or 7 weeks in sampling the large ore reserves. Production has been started at the Deadwood mines. The specially constructed tank-wagons are on the road delivering crude oil for use in the De La Vergne engine. At the Mogollon Gold & Copper company's Little Charlie, the east drift continues in excellent ore; the vein is becoming harder and less oxidized. The Bloomer Girl adit was advanced 93 ft. in ore under the recent contract and it is planned to let another for a like distance. Raising from the main adit is the principal work in progress on the Cooney mine. The drift is being advanced on the Malachite in the ore recently discovered. The management is having the various workings sampled and tested in the new laboratory. The Oaks company's engineers have completed a survey and investigation of the Stevens power project. The Gold Dust Mines Co.'s east and west drifts are reported to have been advanced over 250 ft. in ore. At the Admiral Dewey-Apache, work continues in the north drift from the cross-cut adit.

Mogollon, January 27.

UTAH

BOX ELDER COUNTY

The Lakeside Copper Co. has filed articles of incorporation with the county clerk. The company is capitalized for $75,000, with shares of the par value of 10c. The officers for the ensuing year are H. E. Baker, president; J. M. Russell, vice-president; D. C. Lawson, secretary and treasurer. These, with Fred W. Chambers, A. Fernlund, Anna White, C. A. Zimmerman, P. G. Paulsen, and Thomas R. Tisdale, form the board of directors. At present the company owns and operates 20 mining claims in the Promontory mining district in Box Elder county.

JUAB COUNTY

The water problem has been solved at the Centennial-Eureka mine by the installation of large pumps. Three shifts are working. It is thought the long continued heavy pumping at this mine has resulted in lowering the water-level in some of the neighboring mines. F. J. Hanson and R. Campbell are tearing down the old Eureka Hill concentrator. It is thought the tailing dump, below the concentrator, may be re-worked at good profit. The flue-dust from the Knight smelter, at Silver City, is being shipped to Midvale. Several Eureka men have leased the tailing dump of the May Day company.

PARK COUNTY

Good reports continue from Park City in regard to the new work on the American Flag property. A fine grade of shipping ore is being taken from the fourth, sixth, seventh, and eighth levels, there being three or four fine looking faces on the seventh. Shipments are being made without interruption. One interesting bit of work just completed is the connection between the old tunnel level and the new workings, this providing excellent air as well as affording another exit from the mine in case of need. The American Flag is looking better than it has for several years.

MEXICO

Stockholders of the Dolores and El Rayo companies have been informed by the secretaries that the time for exchanging their shares for that of the Mines Company of America stock has been extended to March 11, 1911, and that all the remaining shares are expected to be turned in shortly. This merger is very close to consummation, for not long ago the Mines Company of America had secured 91% of the Dolores and 93% of the El Rayo issued capitalization.

SONORA

(Special Correspondence.)—A 75-ton lead smelter is being erected at the Mina Mexico, forty miles northeast of Tonichi, the present terminus of the railroad on the Yaqui river. It is expected to blow in some time in February. The cyanide plant of the Barranca Mines, Ltd., has been running since the first of last July, treating 50 tons per day from its own mines. This is a silver-gold property, the ore running in the ratio of 100 oz. silver to 1 oz. gold, but recent development on a cross-vein has shown a body of ore averaging 2 oz. gold and 15 oz. silver per ton. With the addition of a pumping plant, now being installed, the capacity of the plant will be increased to 75 tons per day, and contracts are being made with adjoining mine owners for the treatment of their ore. This will be welcomed by many, as it will enable them to resume development on properties that have been idle since the closing down of the Toledo smelter. The Sunset Development Co., a subsidiary of the Southern Pacific, that has been developing the coal-fields at La Barranca, is contemplating the installation of an aerial tramway to convey the smelting ores from San Javier to the railroad, a distance of about 12 miles. It will put in a producer-gas plant, utilizing local coal, and besides running the tramway, will supply power to the surrounding mines. During the past four years the Buena Vista mine, at San Javier, has developed 25,000 tons of iron fluxing ore carrying 25 oz. silver per ton, and the owners are now awaiting cheap transportation.

San Javier, January 25.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

J. E. Spurr is in Chihuahua.

Gelasio Caetani is in London.

R. T. White was in San Francisco.

J. C. Clancy is at Colorado Springs.

Frank Dennis has gone to Nicaragua.

Howard D. Smith is in San Francisco.

R. H. Chapman is at Washington, D. C.

G. H. Garrey has been at Goldfield, Nevada.

Thomas T. Read has arrived in San Francisco.

F. M. Harris, of Reno, Nevada, was in San Francisco.

Charles Janin has gone to Madera county, California.

W. H. Knowles has returned to Sacramento from New York.

H. Foster Bain was at Blair and Goldfield, Nevada, last week.

J. R. Finlay will be at Miramar, California, for a few weeks.

Algernon Moreino is on his way to New York from London.

J. V. N. Dorr returned to New York, January 20, from London.

C. E. Jamison has been appointed State Geologist of Wyoming.

Henry Francis Lefevre has returned from Managua, Nicaragua.

C. D. Kaeding was in San Francisco, but has returned to Nicaragua.

Edwin E. Chase, of Denver, has gone to Arizona on professional work.

C. W. Purington is at Amazar, Siberia. He will return to London in March.

Ferdinand McCann is manager for El Tajo M. Co., San Sebastian, Jalisco, Mexico.

Jesse J. MacDonald is examining the Mortimer mine at Owenyo, Inyo county, California.

Robert Gordon, mine superintendent of the Montezuma mines of Costa Rica, is in New York City.

R. M. Haskell has succeeded Clarke Sullivan, who recently resigned as metallurgist for the Progreso Mining Co., Triunfo, Baja California.

A. L. Simon, chief metallurgist for Head, Wrightson & Co., London, sailed for England recently. He has been examining a mine in Manhattan.

W. H. Blatchley has resigned as assistant superintendent for the Progreso Mining Co. at Triunfo, Baja California, and after visiting San Francisco and Kansas points, will go to North Carolina.

M. E. Appelbaum has resigned as president, treasurer, and director of the New York Metal Selling Co., and will hereafter conduct an independent metal selling business on commission basis at 55 Liberty street, New York.

Frank H. Probert, of the firm of Weed & Probert, has been in New York recently in connection with the report on the Ray Central and has gone to Boston. From Boston Mr. Probert is to go to Butte, where the firm is engaged in the Anaconda v. Butte-Ballaklava litigation.

C. B. Conlin, formerly with the United States Steel Corporation in Minnesota, late superintendent at the Commodore gravel mine in Sierra county, has taken active charge for the San Luis Consolidated Mining Co., whose properties adjoin the Keystone mine at Sierra City. Mr. Conlin will make his headquarters in Los Angeles.

The San Francisco Section of the Mining and Metallurgical Society will hold a meeting following informal dinner at the Palace Hotel, February 6.

Tungsten ore, 65%, per ton	520.00	550.00
Vanadium ore, 15%, per ton	200.00	250.00
Wolframite (see tungsten ore).		
Zinc ore, 50% up, per ton	*15.00	20.00

The Prospector

This department makes a charge of 25 cents to subscribers not in arrears and $3 to non-subscribers for each determination. To ensure promptness in publication of the determinations, payment must be forwarded with specimens.

G. R. E., Baker City, Oregon: Quartz containing tetrahedrite.

H. M., Golden, Utah: No. 1, friable sandstone: No. 2, schistose silicious rock.

J. A. H., Clifton, Arizona: Massive sphalerite. It appears to have cadmium sulphide with it.

C. J. L., Georgetown, California: No. 1, sericite schist; No. 2, pyritized quartzite; No. 3, chlorite-mica schist; No. 4, amphibolite.

On Saturday, February 4, 1911, the Bunker Hill & Sullivan M. & C. Co. paid dividend No. 161 of $81,750. This makes the total amount of dividends paid $12,456,600.

TABLE OF CONTENTS

EDITORIAL

RUMOR has it that Mr. R. A. Ballinger is to resign "of his own free will," March 4, and that Mr. T. H. Carter will succeed him as Secretary of the Interior. Why?

FOREIGN visible supply of copper decreased 94,080 pounds in the two weeks ended February 1. The world's surplus stock January 1 amounted to 309,735,475 pounds, of which 187,705,280 was held in France and England and 122,030,195 in the United States.

MINING ENGINEERS do not often figure in fiction, excepting the variety found in fake promotion reports. It is refreshing, then, to hear, at a well known New York theatre, one of the characters of the play remark to the hero, a young mining engineer, "I've known some square men in my time, but you are bred in the deep purple." It is a pleasure to be able to reflect that mining engineers, as a class, are bred in the deep purple, and that the exceeding yellowness of certain members of the profession is accentuated by the contrast.

LEADVILLE has been celebrating the recent discoveries of zinc ore in its mines. One feature of the occasion was a luncheon served 1200 feet underground in a room, the walls, floor, and roof of which were zinc carbonate. It is easy to overlook the carbonate minerals, and Leadville's experience in zinc was but a repetition of what happened earlier in Wisconsin, Missouri, and New Mexico. If every rock that might contain zinc were analyzed the chemists would be busy and the job would be long and expensive. In districts, however, where zinc sulphide, which is easily recognized, is present, active search should always be made for the carbonate and silicate.

CYANIDATION without preceding concentration of the slime is being carried on at the mill of the Tonopah Extension Company, the tube-mill product going direct to the cyanide settling tanks. The manager, Mr. John G. Kirchen, finds that so far there is no difference in total extraction, and apparently no great difference in cyanide consumption. It is not long since it was generally considered impracticable to cyanide ores containing sulphides. The first step was to separate the sulphides by concentration and ship them to the smelter. Later various plans of cyaniding the sulphides separately were worked out. Then at the North Star mine the sulphides, after being concentrated and re-ground, were remixed with the slime for treatment, and now Mr.

Kirchen, temporarily at least, discards concentration altogether. His further results will be watched with much interest.

Lost Motion

Slipping belts, gears that do not mesh, loose eccentrics, leaky valves, spilling launders, all these indicate wasted energy. Whether it be measured in the indicated horse-power of a reciprocating engine, the brake horse-power of the turbine, the gross power of the water wheel, the kilowatts delivered by the generator, or the days work of the employee, energy is the most important element entering into costs. Misdirected or wasted energy must be paid for at the same rate as that which accomplishes a useful purpose, and in every cost sheet there is a large charge for 'lost motion,' though we do not remember ever to have seen it frankly stated as such. The greatest benefit to be derived from the new 'science' of efficiency is that the cost of inefficiency is stated and its source determined. Railway men were frankly skeptical when Mr. Louis Brandeis, a lawyer, asserted that a million dollars per day might be saved by more efficient operation and that it was entirely practicable to make the saving. As closer comparisons are made between results now achieved on different roads, the feeling of skepticism is distinctly moderating. It is trite that conditions differ and that costs must follow, but comparisons, fairly made, give standards, and repeated measurements are great incentives to progress. The most valuable standards are those most immediately applicable. Rand costs are mainly of academic interest on the Lake Superior iron ranges, but steam-shovel costs mean something at every property where steam-shovels are in use, or where their introduction is physically possible. The ideal plan is a standard for each mine, and for each piece of work in the mine. Usually these standards are largely carried in the head of the foreman or other staff officer. The system now being advocated by Mr. Harrington Emerson, Mr. F. W. Taylor, and other proponents of 'efficiency engineering,' involves translating this usually nebulous and largely subconscious set of standards into a concrete set of figures and continually measuring performance against them. Net results are to be set down month by month alongside of predetermined estimates and the difference between plants and achievement is to be charged to a special suspense account. It is clear that the value of any such system lies in the accuracy with which a correct standard is determined. This calls for highly trained men and special knowledge. It also calls for painstaking investigation of past performance, and we believe there is danger in the growing notion that a specialist may be called in to inaugurate a system that will automatically increase efficiency. Without doubt his outside point of view will be of value, but an inside point of view is also essential. Granted, however, that an accurate set of standard costs be available, there can be no question as to the resulting gain from regular comparison of unit cost and standard cost. We know one mine where figures showing working cost per ton of ore in each stope are available to the shift-boss every day, and the total cost, including overhead charge, is pro-rated once a week. It is perhaps significant that operating costs at this mine have steadily decreased and are now lower than at any other property in the district. Psychology is important in mining as elsewhere.

Chinese Labor

We publish this week the concluding installment of an interesting description of actual working conditions in Eastern Siberia. Mr. C. W. Purington's article is suggestive in many ways. It is customary to think of China as the land of cheap and efficient labor, so much so that, except where it is physically impossible to concentrate a sufficient number of coolies at one point, the introduction of modern machinery is not to be attempted. In the last analysis, however, correct procedure is determined by the cost per horse-power-year; the cost of rice per coolie, with no charges for maintenance and depreciation, versus the cost of coal or oil for steam, plus repair, depreciation, and interest charges. Contrasting steam-shovel work in the open-cuts at Ely, Nevada, with handling ore by coolies in the open-cuts at Tayeh, Hu-nan, we find the costs slightly less at Tayeh. It seems clear, then, that Mr. Purington, as he suggests, did not obtain the best class of Chinese labor at Kolchan. The reason for this is not far to seek. The Chinese have a rather well-founded belief that northern Manchuria and Siberia are lawless countries, infested with brigands. As a result, they do not plan to make their homes there, but yearly the more adventurous spirits go north to seek their fortunes, returning with the beginning of winter. The most venturesome will be found farthest north, and the most venturesome do not make the best miners. The efficiency of a Chinese workman largely depends upon the efficiency of the man who has taught him how to work; more specifically, upon the power to thread the intricacies of the Chinese mind and teach in the right way. Well trained Chinese workmen are undoubtedly among the best in the world, but they must be well trained from the beginning; to repair the deficiencies of early training is a hopeless task. The more docile characters are the more easily trained, and this is why the lamb-like Korean makes such a good miner.

Not less important is the matter of transportation. If transportation from South China were easy and convenient the labor problem would be solved, for then the overcrowded population of that area, one that furnishes excellent workmen, like the Californian Chinese, would be available. Freight charges that mount and mount through transhipment after transhipment must be reckoned with as well, while perhaps the most important of all is the question of time. The problem of needing machinery tomorrow when the nearest point at which it can be obtained is three months away is almost enough to discourage the most optimistic engineer. Fortunately the men who go out to find the riches of the earth in her waste places have stout hearts and resourceful minds.

Mining in the San Juan—IV

By William H. Storms

Eight miles southwest of Ouray, and high up amid the rugged cliffs, on the south side of Sneffels creek, which is the west branch of Canyon creek, is the group of mines owned by the Atlas Mining & Milling Co. Just over the nearly vertical ridge of volcanic rock, to the southwest, lies the group of the Revenue Tunnel, including the famous Virginius. This latter is credited with a production of $44,000,000. A short distance farther southwest, in Savage and Marshall basins, are the Tomboy, with a record of $18,000,000, and the Smuggler-Union, which has produced $35,000,000.

Fig. 1. Rock-Stream in Silver Basin, at Atlas Mine.

Near the Tomboy is the Japan-Flora group, a comparatively new property, rapidly developing into a great mine, and between them, following closely the crest of the ridge, lies the Camp Bird, which has produced $17,000,000. The great adit of the Virginius group, known as the Revenue Tunnel, enters the mountain near its base, on the south side of Sneffels creek, and runs for more than 7000 ft. in a southwesterly direction, cutting several veins in its course, including those of the Atlas company. Through this adit the Virginius-Revenue group has been worked for many years. The mill, now an antiquated affair, and much in need of repair, still pounds away, on ore from the company's mines, though the scale of operations is much less extensive than in former years. A good deal of development work is in progress, however.

The Atlas group comprises over 20 claims and covers a somewhat intricate system of veins, the most important of which are the Hidden Treasure, Atlas, and Nacoochee. The last two are nearly parallel and but few feet apart for a long distance, uniting (probably crossing) in the Atlas claim, and then diverging to the southeastward. The various mines have been acquired by purchase and location, and the group now forms one of the largest properties in the San Juan region. Extensive development has been in progress for several years, and still continues, for these great mines of the San Juan mountains cannot be made in a day, nor in a single year. At the time of my visit development was being urged in both the east and west ends of the property; in the former through the San Pedro adit, and in the latter by means of the Atlas adit, the object being to connect these workings, thus improving ventilation, and making it possible to send the ore mined in the San Pedro westward through the Atlas adit to the mill, situated several hundred feet below its portal, and with which the mine is connected by aerial tramway of the 'jig-back' type. These workings are at an altitude of over 11,400 ft., just below timber-line, and an idea of climatic conditions may be surmised when it is stated that in one of the levels I saw a mass of ice 30 in. high, about the same width, and over 60 ft. long, that had remained there throughout the summer. The work on the Atlas vein has exposed a vein varying from a few inches to 4 ft., the value ranging from $5 to $50 per ton, mostly silver, though occasionally gold predominates, running up to $15 or $30 per ton. Sometimes very rich ore, chiefly tetrahedrite, is found running hundreds of dollars per ton. When

the eross-eut adit reaehed the Atlas vein a drift was started each way on the ore, but driving easterly toward the San Pedro was carried on uninterruptedly. When 400 ft. had been driven on a vein a slight disturbance oeeurred in the fissure, whieh was found split into several seams, and the work was eontinued on what seemed to be the most important of these. The vein soon formed again, defleeting somewhat to the northward, with regular walls, and was followed for 1900 ft. Although the vein was found to eontain a great deal of ore, it was assuming a different eharaeter, and was generally of lower grade. Finally it turned so far to the north that it was eoneluded that the main Atlas vein had been left at some point in the drift. Aeeordingly a diagonal eross-eut was started in the direetion of the San Pedro workings, and driven several hundred feet, eventually eutting the main vein. In the meantime, a slight eave oeeurred at the plaee where the first deflection in the vein was notieed, whieh exposed some high-grade ore. A drift was started here, and in a few feet the Atlas vein was found, re-formed, solid, and of exeellent grade. On another vein, known as the Crown Point, a winze was sunk 50 ft., where the vein was 3 to 8 ft. wide, with 1 to 6 ft. of quartz averaging $50 gold; some of the ore was high grade. A great deal of other development work and some stoping by lessees has been done on the various elaims of this property, and the aggregate produetion reaehes many thousand dollars. The middle portion of the mine workings lies direetly beneath Silver Creek basin, shown in the aeeompanying illustration from the interesting paper on 'Landslides of the San Juan,' by Ernest Howe, of the U. S. Geologieal Survey. The main workings are beneath the high ridges, which rise from 1500 to 2000 ft. above the basin at either end. Where the veins pass through the erests of the ridges, deeomposition and erosion have eaused gaps or notehes to be eut in the roeks, whieh are elearly diseernible against the sky-line viewed from the basin. In this basin is seen what may be considered the perfect type of the remarkable roek-streams whieh oeeur in the San Juan mountains and whieh were deseribed in a previous paper. This Silver basin rock-stream bears on its surfaee the eurious eoneentrie ridges eharaeteristie of these streams, and whieh eontribute so much to their resemblance to glaeiers. That these rock-streams owe their existenee to glaeiers there is, in my mind, no doubt. The study of the roek-streams, landslides, talus slopes, and moraines, is among the most interesting of the many to be found in these wonderful mountains.

What the Atlas mine needs most is increased milling faeilities, these being at present restrieted to a 10-stamp mill with eoneentrator and eanvas tables. This little mill, however, under the direetion of Andrew Shipman, has suffieed to work out the metallurgieal problem, so that when a larger mill is provided for, there will be no uneertainty in the method of ore treatment that shall be adopted. The scheme of treatment worked out by Mr. Shipman was not arrived at by ehanee, nor by the adoption of the methods of others, but was worked out with eare after many diseouraging trials. The accompanying flow-sheet will prove interesting.

The ore is highly silieious, carrying galena, blende, pyrite, chalcopyrite, tetrahedrite, and some less common minerals, and the problem of eoneentration is

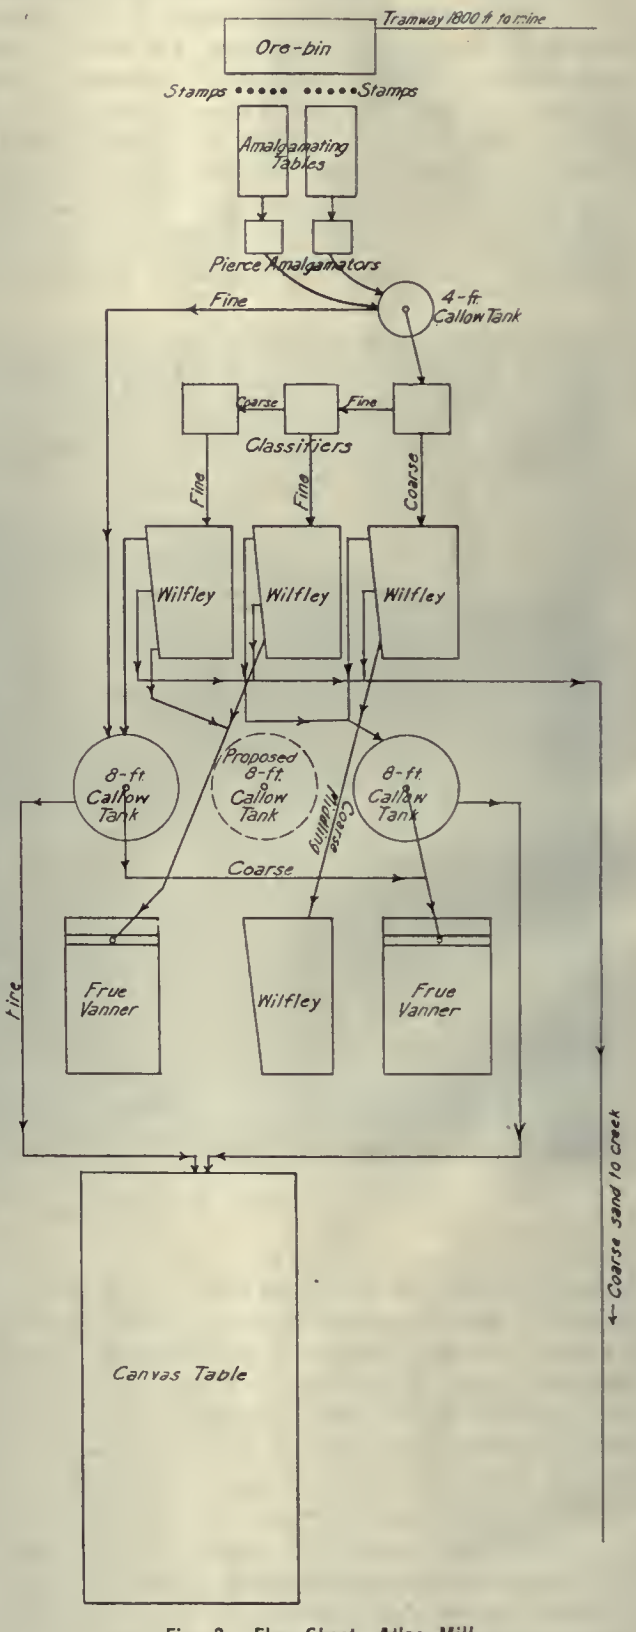

Fig. 2. Flow-Sheet, Atlas Mill.

not an easy one. Moreover, the ores from the various veins are distinetly different in character, and often vary radieally from plaee to plaee in the same vein, so the mill superintendent must keep eonstantly alert to see that he is not losing in the eoneentrating department. The eoneentrate from the Wilfleys

and vanners is sent down to a loading platform near the base of the mountain by means of a chute, saving much trouble and some expense in transportation. That from the canvas tables is sent to the same platform, where the sacking is done and the wagons loaded for the railroad which takes it to the smelters. The Atlas mine is one of the great properties of the San Juan, but as yet it has comparatively only superficial development. The vertical range of the veins, from the base of the volcanic series up to the varying profile at the surface is from 2000 to over 3000 ft., with nearly 7000 ft. horizontally along the Atlas and other veins, a territory which it will require years to develop and exploit. Besides this, the company owns another large area in the vicinity traversed by other veins, on which little development has been done. An interesting geological feature of this district is what

Fig. 3. Mount Sneffles, as Seen From the Atlas Mine.

is known as the Wheel of Fortune vein. This fissure cuts the country for miles, striking in a northeasterly direction, dipping southeast. It is one of the latest fissures in the region, cutting and slightly throwing the numerous veins in its course which strike west of north. It can be traced from the south side of the crest of the range in San Miguel county to beyond Ouray. Although it is explored at many places by cuts, short adits, and shafts, pay-ore has not yet been found in quantity at any place in its entire length of eight or more miles. It is a most remarkable vein and a perfect type of the fault-fissure. Between the Camp Bird mill and the Revenue Tunnel the Bagdad-Chase Mining Co. undertook the development of some property a year or two ago, but abandoned the enterprise, not having found anything considered to justify further expense. Several other small properties in the vicinity have superficial development, but none of them as yet has proved profitable. In fact, the San Juan is not a 'poor man's country,' generally speaking. The ores are of good grade, but complex in character, requiring a high order of metallurgical skill to properly treat them. Large capital is required to provide for transportation if the property be far from the established roads, and usually a great deal of money and time are neeessary to develop the veins, build mills, and establish a camp, with the essential machine-shops and comfortable aeeommodations for the workmen. The metallurgical problem is always uncertain, and must be worked out in each case, the neighboring mills affording only suggestions as to the best course to pursue; for, as previously stated, no two mills in the San Juan are built alike, and the processes of treatment vary in a most remarkable degree.

In working out the seheme of treatment in the Atlas mill, Mr. Shipman has introduced the canvas plant, as indicated in the flow-sheets. The slime saved on these tables is high grade and the results obtained testify to the value of this method of treatment of the tailing from the previous operations. The Atlas mill is not the only one in the San Juan where this method of slime concentration is employed, for in the Smuggler-Union mills, at Pandora, in the southern outskirts of Telluride, is an elaborate canvas plant, whieh will be referred to later.

The seventh annual report of the Goldfields Water Seheme at Kalgoorlie, Western Australia, exhibits a reservoir capacity of 4,680,000,000 gal., a total inflow from April to August of 10,121,000,000; length of main and reticulation, 463 miles; number of services, 13,252; water consumed by mines, 482,664,000 gal.; by railways, 85,066,000 gal.; by general services, 434,009,000 gal., a total of 1,001,739,000 gal. The gross income for the year was $1,105,000; operating expenses, $360,000; interest on supplementary capital, $58,000; sinking fund, $47,000; interest on main capital, $456,000; sinking fund, $398,000, a total of $1,319,000; deficit, $214,000. The total capital expenditure to date amounts to $16,165,000. The report shows an increase of 32,143,000 gal. used, an increase in revenue of $400,000, and a deficit of $185,000 less than that of the previous year. Charges vary from 36c. to $4 per 1000 gal. In view of the installation of apparatus to add five grains of CaO per gallon to prevent corrosion, it is interesting to note that during the year 177 holes were eaten through the main conduit. The cost of pumping 353 miles was 11c. per 1000 gal. The seheme has been the means of expanding the mining industry, and making life more tolerable for those engaged therein.

In veins of a variable dip, or in large deposits where the walls change their dip, bonanzas are often found in the flatter portions of such veins or walls. This is of surprising freqnency, and when sinking in a vein the dip commences to flatten, better ore may usually be anticipated. There are exceptions to this, but in the greater number of cases it will be found that the ore shows improvement on the floors, or places of low dip. However, rules in mining geology are often unsafe and may lead away from the truth.

Sluicing at the Kolchan Mines, East Siberia—II

By Chester W. Purington

(*Continued From Page 196.*)

Summary of Costs. Cost of handling gravel on the Kolchan property by various methods may be summarized as below:

(*a*) By hand-shoveling from shallow bank to cars, tramming same to foot of derrick, hoisting same, dumping to fixed sluice and washing in open sluice (No. 1) (capacity 233 cu. yd. per 24 hours): working cost, 1.34 Rs.; fixed charges, 1.80; total, 3.14.

(*b*) By hand-shoveling from loose tailing stacked so as to afford dump-room, wheeling to sluice (No. 2), and washing in open sluice (capacity 100 cu. yd. per 24 hours): working cost, 0.59 Rs.; fixed charges, 0.69; total, 1.28.

(*c*) By digging, transporting, and delivering to fixed sluice (No. 2) by mechanical drag-line excavator, and washing with water raised with centrifugal pumps (capacity 593 cu. yd. per 24 hours): working cost, 0.31 Rs.; fixed charges, 0.69; total, 1.00.

(*d*) By hand-shoveling from fresh bank, wheeling, and dumping to fixed sluice (No. 3) (capacity 30 yd. per 24 hours): working cost, 2.86 Rs.; fixed charges, negligible.

Comment on the above may be offered as follows: (*a*) Hand-shoveling and hoisting by derrick, costing 3.14 Rs., is not an economical type of plant for Asiatic conditions. The total cost is not excessive, comparing it with similar plants in Alaska, but the low capacity and disproportionate amount of foreign supervision necessary are sufficient reasons to condemn any further attempts to install similar plants in East Siberia. (*b*) The cost of hand-shoveling and wheeling of loose tailing is less than half that of dealing with fresh ground. Under special conditions this type of operation is advisable in Siberia. Where the amount recoverable is less than 2 Rs. per cu. yd. it is to be avoided. (*c*) The cost of 1 Rs. per cu. yd. determined for the excavator plant is a valuable factor in our present knowledge of Siberian gravel mining. Together with the comparatively high capacity attained (nearly 600 cu. yd. per 24 hours), the low cost of this operation, and the low capital expenditure involved, commend this type of plant where physical conditions are suitable. As a general rule, with recoverable gold of 1.50 Rs. per cubic yard or over, and where ten seasons work is in sight, the plant is to be recommended. (*d*) The isolated Pokrovsky plant operated at practically the same cost as the 1908 shoveling operation on the Kolchan, namely a little under 3 Rs. per cubic yard. The capacity in 1908 was larger, as the conditions were easier. As a rule it may be said that a gang of Russian laborers will handle two and a half times the capacity at two-thirds the cost per cubic yard in shoveling to a string of American sluice-boxes, as against the same number of men working with the ordinary Siberian long-tom, variously called *Butara* or *Amerikanka*. The use of the string of boxes also lessens the chance for theft. Shallow creek gravels carrying over 5 Rs. per cubic yard are not infrequent in East Siberia, and can be profitably worked by this method of shoveling in, the only capital expenditure necessary being for tools, sawed lumber, and provisions.

Sluice No. 1.—My foreman was not able to commence preparations until the first week in April 1909, when the annual break-up of the frost rendered work difficult. Five log buildings, including a machine shop and blacksmith's shop were moved to a new site, a quarter of a mile away, and re-erected. Four thousand feet of two-foot flume was constructed, and an old retaining dam was repaired as well as possible. Pumping plants and a good sluicing plant were erected. Two old steam-shovel excavators were dismantled, and a hoist and derrick plant was constructed from the parts. These preparations were finished early in July. The plant, supplied with water from the Kolchan creek by pumping, and having its gravel furnished by Chinese shoveling into cars, which were lifted by derricks to the sluice, ran from July 8 to October 5 inclusive, handled 21,000 cu. yd. of gravel, and recovered approximately £8,300 (81,533 Rs.) from about one acre of ground worked. Together with the work of the year before, which began the cut finished by the derrick plant, the total gross recovery from this one place has been very nearly £10,000 (96,033 Rs.). The work was a continuation of the work on the small rich bench which was carried on in 1908.

In 1908, 39 days work done by simple shoveling in, handled 2000 cu. yd. of gravel, with a gross recovery of 14,500 Rs. In 1909, the sluice, fed by derrick, operated for 90 days from July 8 to October 5 inclusive, actually operating 1500 hours out of a possible 2160, or about 70% of the time, handling 21,000 cu. yd., recovering 5989 oz. of amalgam worth 13.61 Rs. per ounce, or 81,533.10 Rs., being at the rate of 3.88 Rs. per cubic yard. The total yardage handled by sluice No. 1 in 1908 and 1909 was 23,000, which, with 96,033.10 Rs. recovery, gives an average of 4.17 Rs. per cubic yard. It is estimated that 80 kopecks has been lost in the tailing owing to washing in open sluice. This will be recovered by the dredge, as the tailing will all be re-handled. The sampling of this bench showed 30,000 cu. yd. having a recoverable tenor of 2.40 Rs. or a total of 72,000 Rs. The actual recovery has therefore already given over 24,000 Rs. more than the sampling showed, and 9000 cu. yd. remain to be worked. With what will still be recovered from tailing and what can be reached of the untouched portion by dredging, it is safe to say the bench will afford another 20,000 roubles.

The plant consisted of two centrifugal pumps, 8 and 9 in., operated by two portable engines, 15 and 25-hp. respectively, set up at the bank of Kolchan creek. They lifted together 250 miner's inches of water, to a height of 40 ft. This water was carried around by 350 ft. of flume on trestle to the dump-box of the sluice. The sluice consisted of two dump or mud boxes in succession, the first on 12 in.,

the following on 16-in. grade, around which platforms were built, one side being inclined, in hopper form. These boxes, each 16 ft. long and 4 ft. wide, set 18 ft. above the surface, were narrowed at the lower end to discharge into the main sluice of 30 in. boxes, on 8-in. grade. This sluice was originally 200 ft. long, and lengthened as the dump filled, and spread with Y's until the total sluice length was 500 ft. Riffles were wooden poles of larch 12 ft. long and 3 by 4 in. in cross-section, set ¾ in. apart. These were found more satisfactory than wooden Hungarian iron-shod riffles, which wore badly. Two derricks, one on either side of the sluice, operated by separate hoists, served to lift the gravel in wooden skips from the trucks to the sluice. The trucks were parts of old Koppel side-dump ore-cars,

which were inherited from the Oehotsk company. The wooden derriek-skips, fashioned to be set on these trueks, were made by Franz Mrkos on the premises, the irons being forged in the shop. Gravel was barred or pieked from the bank and shoveled into the skips by hand labor, mostly Chinese. After being filled, the skips were trammed to the derriek-foot and hoisted. The plant, whieh was in all respeets similar to those used on the Alaska and Klondike ereeks was weak from the element of poor hand labor. Chinese eontractors, or rather Harbin gamblers posing as eontraetors, robbed and half-starved their men, who in eonsequenee were feeble and ineffieient. Serious delays were eaused in the midst of the season by the neeessity of ehanging from the eontraet system to day-pay. This ehange, and the substitution of Amerieau foremen, resulted in great improvement. Unfortunately the season was spent except 21 days, and the best part of the bench was already worked. In the first 69 days, 14,000 eu. yd. or only 203 eu. yd. per day was handled, at a eost for pit labor and foremen of 98 kopeeks per yard. In the last 21 days, 7000 eu. yd., or 333 eu. yd. per day was handled at labor eost of 72 kopeeks per eubie yard. The eost per eubie yard of hoist and pump labor in the last 21 days also showed improvement, in spite of the faet that the wages of all engineers and firemen were raised. Taking the season as a whole, the duty of shovelers was less than 2 eu. yd. per shift per man, or about two-fifths of what it should have been.

The eapital expenditure for this plant is praetieally written off, as it was mainly expended in labor for moving buildings, sawing lumber, building flume, trestles, and sluiee-boxes, and moving and eonneeting old maehinery inherited from the Russian eompany. One new hoist and set of derriek irons were in use a portion of the time, but as these are uninjured and necessary in the dredge eonstruetion, very little amortization is ealled for. The plant was well equipped for its work, and earned a small profit. The work proved, however, that plants of this eharaeter are not eeonomieal in Siberia on aeeount of the ineffieieney of the loeal labor. Besides this defeet, the insuffieieney of water supply owing to exeeptionally dry season redueed the eapaeity of sluiee No. 1, although not as seriously as in the ease of sluiee No. 2. Both in this work and in that of sluiee No. 2 thanks are due to the members of the staff for earnest and eonseientious work under diffieult eonditions. J. P. Hutehins assisted materially in making the sluieing plants a sueeess.

Sluice No. 2.—Altogether this plant handled 39,000 eu. yd. of tailing stacked up by the old company: 4000 eu. yd. was hand-shoveled, and 35,000 eu. yd. was dug by a Page-Crawford drag-line exeavator, dumping directly into 24-in. open-sluiee, with whieh its traek ran parallel. The total reeovery was 3095 oz. of amalgam, worth 13.02 Rs. per oz., or 40,348.53 Rs. The gross valne was thus 1.03 Rs. per eubie yard. The amount going into the tailing from this operation was small; I shonld judge not mueh over what it will eost to move it when the area over whieh it is spread is dredged.

During the month of March 1909, 4000 ft. of 2-ft. flume, mainly on low trestle, on grade $^3/_{16}$-in. to 12-ft. was eonstrueted from old lumber, and a small proportion of new lumber prepared by whip-sawing. This flume led the water of Abramovsky ereek on grade to the rieh staeked tailing sampled in 1907. The eost of this flume, for labor and material was one ronble per foot, whieh is very low. It is in good shape for several years serviee. Normally it affords 200 miner's inches of water, but in the dry time of last year the supply sunk to less than 50. This flume supplied sluiee No. 2 with a portion of its water during 81 days run from July 22 to October 11. The sluice was also supplied with water from a 10-in. eentrifugal pump, operated by a 35-hp. portable engine, lifting 35 ft. from Kolehan ereek. A further addition to the supply was obtained by leading the excess water from sluiee No. 1 by 300 ft. of 9-in. pipe arranged as inverted siphon from No. 1 flume to the head-box of sluiee No. 2. The sluiee was run longitudinally through the ellipse-shaped flat-topped tailing-pile. Some four thousand eubie yards of the top seven feet of gravel was shoveled into the sluiee by Russians on eontraet, at a working eost of 59 Kop. per eubie yard, while the exeavator was building. Fixed eharges added 69 Kop. per eubie yard to this eost.

The sluiee-boxes of sluiee No. 2 were built mueh heavier and stronger than those of sluice No. 1. Although of 30 in. width at first this was found too wide to earry the large stones, and lining boards were put in to narrow it to 24. The first length of 200 ft. was gradually extended in straight sluiee and Ys to spread the dump, until over 600 ft. length of riffle-surfaee was finally afforded. Wooden poles were used as riffles at the upper end, but the greater length was paved with 16-lb. steel rails, eut in 12-ft. lengths. The grade was 8 in. to 12 ft., whieh was found very satisfaetory.

The exeavator used at this plant is an entire experiment in plaeer mining, and had never been tried previously so far as I know. In April I ordered in Chieago a Page-Crawford scraper-exeavator with 1½-eu. yd. bueket. This maehine, weighing with extra parts 50 tons, was ordered from the Lidgerwood Manufaeturing Co., April 6: was delivered from Chieago, April 16, was shipped on steamer *Mongolia*, together with other maehinery and supplies, from San Franeisco, May 5, 1909. The shipment went by way of Nagasaki, Japan, Vladivostok, Nikolaievsk, and Lake Chla, and arrived on the property July 15. The excavator was erected in three weeks on top of the 150,000 eu. yd. of tailing which previous sampling had shown workable. It eommenced work on August 12, and was shut down on October 11, 1909. Water was supplied to this sluice by a flume, and by eentrifugal pumps. The required amount was 600 eu. ft. per minute, but owing to the extremely dry season it was seldom possible to furnish more than half the requisite quantity. Thus it was impossible to run the exeavator at anything like full eapaeity, that is, 24 hr. per day. The average run was 10 hr. per

day. At this rate, in 59 days, up to October 12, there was excavated and washed 35,000 cu. yd. of tailing, at an actual operating cost of under 20 kopecks per cubic yard. The cost of 30 kopecks hereinunder given includes allowance for expensive transport of imported machine-runners. As in the case of Sluice No. 1, fixed charges added greatly to this cost.

The entire plant burned about 6 cords of wood per 24 hr. and utilized the services of only 7 men on a shift in its operations, namely, a machine-runner, fireman, wood-packer, pumpman, and 2 sluice tenders. The same amount of gravel handled per day by any method requiring the labor of men locally available would have necessitated the employment of 300 men. Moreover, the amount handled, 600 cu. yd. per day, is less than one-third of what the excavator can handle if working to its full capacity. The excavator was erected and operated during 1909 by a first-class erector, who was

Excavator on Tailing Pile.

brought from Chicago to take charge of it. But during the summer two new men were taught to operate the machine, one a young American student, and one a Riga Russian, both of whom are less expensive to employ than a special erector. It is planned to teach other German-Russians to operate this machine, and thus eventually to depend on native labor.

The excavator is of the rail-circle type, the lower carrying-frame being itself mounted on trucks, which run on 90-lb. rails. These were laid parallel with the sluice, at a distance of 60 ft., the length of the structural-steel boom which leads the hoist-line over a head-sheave to the 1½-cu. yd. scraper-bucket. One man handles both hoisting and swinging engines, and controls the entire operation. A fireman is the only other man necessary or allowed about the machine. The bucket is dropped into the gravel, and dragged toward the machine. It can dig at any point in a radius of 60 ft. away from the centre, and from 0 to 30 ft. below the track of the machine. After filling, it is hoisted, held horizontally, or slightly inclined backward, so as not to spill water or gravel. The machine is then swung through an arc until the bucket is suspended over the sluice, when it is dumped by letting up on the drag-line, through an ingenious arrangement of a short compensating cable connecting the two main lines. The machine works backward, and when ready for moving, two track-layers are called on to remove the track-ties. The machine lifts the track section from in front and deposits it in position at the rear. When the track is connected the operator digs the teeth of the bucket into the ground behind, and pulls the excavator 10 ft. back. It is then ready for a new cut. It must be remembered that the bucket can be successfully dumped only in a position vertically below the head-sheave.

The 1909 cuts were 120 ft. wide and from 27 to 30 ft. deep. After digging 24,000 cu. yd. on the east cut, all the water connections to the sluice were removed, and the machine was moved in two days a distance of 400 ft. to the north end of the proposed west cut. The pipe and flume connections were then restored and 11,000 cu. yd. was dug on this cut before shutting down at the close of the season. This cut is about one-third finished. The

Bucket Digging in Bank.

following report was furnished by the foreman in charge of the excavator:

August 12 to 26, inclusive, 215 hours work, capacity about one-third. August 27 to 31, inclusive, 79 hours work, capacity about one-half. September 1 to October 10, inclusive, 303 hours work, capacity practically full. The entire work done was equal to the full capacity of the machine working 16⅔ days of 24 hr. each at full capacity of 2170 cu. yd. per day. The actual work done for the period of 59 days over which the excavator worked was 593 cu. yd. per day.

From experience last summer, I am entirely justified in saying that had the machine not been shut down fully half the time for lack of sluicing water to wash the gravel dug, an average time of 20 hr. per day would have been maintained, with a yardage of 1750 per day. This capacity is larger than that of European gold-dredges in general.

The washing requirements for Sluice No. 2 necessitated a constant flow of 400 miner's inches of water to wash the gravel and carry away the tailing. This amount was only obtainable during the last 12 of the 59 days during which the excavator worked. During the driest month, September, there were only about 250 miner's inches available for both sluice No. 1 and No. 2, and the Abramovsky

creek, which in normal years supplies nearly this amount by itself, ran almost dry. A reservoir from which the 10, 9, and 8-in. centrifugal pumps all got their supply, was only fully completed on October 2 by making a hydraulic-filled dam of tailing from sluice No. 2 across the Kolchan. It was then possible to run the water from sluice No. 2 back into this reservoir, and keep the same practically full. All the ingenious contrivances resorted to by the hydraulic miner, such as gates and turn-outs in the sluice, the use of shear-boards to cut down the dump, the intelligent use of sluice-forks in breaking jams, etc., were instituted and supervised by J. P. Hutchins, without whose painstaking work the capacity of the plant would have been very much less.

Notwithstanding the inevitable use of incompetent local labor (mechanics, carpenters, and sluicemen), besides great difficulties attendant on late starting and inadequate preparations, Sluice No. 2 demonstrated the principle that entirely new methods of handling gravel, embodying the latest types of machinery, and cutting down hand and horse labor, can be successfully installed and operated by foreigners in Siberia with comparatively small capital expenditure. Heaps of tailing having the approximate shape and size of that worked, exist in the Zea, Selenja, and Lena regions, and contain from 2 to 4 roubles per cubic yard. Where gravity sluicing water is available, these piles can be worked profitably by an excavator and fixed sluice, like the No. 2 plant. The capital expenditure for the entire plant erected would likely be under 60,000 Rs. in the more remote Siberian districts. Advantageous 'Staratel' or temporary leasing arrangements can be made with Siberian mine-owners, thus obviating government interference.

COST OF EXCAVATOR OPERATIONS AT SLUICE NO. 2

	Rs.	Rs.
Labor—Day shift (average 10 hr.).		
1 foreman at 20 Rs. per day (operating the excavator)	20.00	
1 fireman at 2.50 Rs.	2.50	
1 wood packer at 1.60 Rs.	1.60	
2 sluice tenders and track layers at 1.6 Rs.	3.20	
1 pump engineer at 2.50 Rs.	2.50	
1 fireman at 1.60 Rs.	1.60	
		31.40
Night shift.		
1 foreman at 6 Rs. per day	6.00	
Others (as above)	11.40	
		17.40
Or for 2 shifts per day		48.80
To this the labor of carpenters, machinists, blacksmiths and general outside men added per day		14.85
		63.65

Thus the total working cost chargeable to the actual operation of Sluice No. 2 with excavator plant was 10,850 Rs. for handling 35,000 cu. yd. in 59 days of the 1910 season. In my estimation, this was the most important figure arrived at as a result of the season's work. To it naturally must be added the cost resulting from fixed charges as below shown. But it would be the greatest injustice to consider these charges as in any degree representative, for this character of work.

As Sluice No. 2 will not be used again, owing to the transfer of the excavator to Pokrovsky in 1910, it is necessary to include in the 1909 fixed charges all the construction charges for sluice No. 2, as well as the proportional part of the items listed under sluice No. 1; as general manager's salary and expenses, foreign staff expenses, taxes, police, hospital, legal, bank, bullion, and camp and road maintenance.

	Rs.	Rs.
These amount to		40,148
Less working expenses excavator plant	10,850	
Less working expenses hand-shoveling	2,360	
		13,210
For entire 39,000 cubic yards		26,938
Per cubic yard		0.69

Of this amount the total fixed charges against the excavator plant are 35,000 × 0.69 Rs. = 24,150 Rs.

The total cost per cubic yard of handling and washing gravel with the excavator plant was:

	Rs.
Working cost	0.31
Fixed charges	0.69
	1.00

The net results of the excavator plant were: Fixed charges, 24,150 Rs.; working cost, 10,850 Rs.; total cost, 35,000 Rs.; recovery in gold, 36,050 Rs.; net profit, 1050 Rs.

COST PER CUBIC YARD.

	Rs.	Rs.
Total labor for the 59 days		0.11
An additional item which must be charged to labor account was the proportional share of traveling expenses, and pay en route of the two American foremen, 3760 Rs.		0.10
Repairs, a total of 1289.15 Rs.		0.04
Supplies consumed.	Rs.	
Wood (about 6 cords per day)	791.90	
Tools	25.65	
Excavator parts	99.49	
Steel cable	241.82	
Oil	61.46	
Coal oil	11.50	
Carbide	15.90	
Nails	60.55	
Quicksilver (gain instead of loss)	00.00	
Lumber, for new boxes and trestles as the work progressed (lumber used in first construction not charged), about	300.00	
Sundries, lighting, stables, melting, and store charges	514.65	
Total supplies	2,122.92	
Total for supplies and sundries		0.06
Total working cost per cubic yard		0.31

The cost of the construction of Abramovsky flume and sluice No. 2 has been entirely written off under the head of fixed charges. This is a very conservative basis to reckon on, as the flume will be useful for at least two years more, and the sluice-boxes are in good condition and useful in other portions of the property. The cost of the excavator, erected and ready to run, was 22,023.16 Rs. Of this, 10% has been arbitrarily written off, although the machine is in perfect condition and good for several years service.

Pokrovsky Claim.—The Pokrovsky area, comprising a part of the Kolchan property, was practically discovered during the season of 1909. It had been worked in a desultory way by the old company, but no records of product were available, and the area was not included in the assets of the property indicated in my report of 1907. Early in 1909 it was reported to me that a gang of Chinese was stealing gold at night from the Pokrovsky ground, four miles south of the main Kolchan camp. In order to more

effectually guard this isolated spot, I sent a few shovelers under a trusted man to camp there, and installed a string of sluice-boxes. During about 50 days 1500 cu. yd. was washed, constituting a respectable sample, from which nearly 5000 roubles was recovered. The gravel washed was taken from various parts of an area of about an acre and a half. Pan samples of the same material gave results from two to three times as high as the saving in the sluice-boxes. This was because the amount of clay in the gravel and the small amount of water available, only 40 cu. ft. per minute, caused more than half of the gold to escape. The cost of working was 2.86 Rs. per cubic yard, of which 2.52 Rs. was for labor, the remaining 34 kopecks being for supplies and sundries. Little supervision was required after the sluicing was once started, and the cost is fairly representative of what plain shoveling and wheeling from bank to sluice will cost in Siberia, under conditions of little water and where gravel is difficult to wash.

Labor.—An important fact determined beyond question during the 1909 season relates to labor. While it is certain that hand-labor operations in Siberia are to be in general condemned, it is also certain that mechanical excavators of large capacity, and in all probability dredges, can be eventually operated by a certain class of Russian subjects, namely, Germans from the Baltic provinces. This means that instead of paying expert men to come from abroad, managers may look to developing a class of native machine-runners, the annual expense of whose wages and expenses will be from one-quarter to one-half that of similar men brought from abroad. This fact has a double advantage. It reduces expenses, and inclines the local population and government more favorably toward a foreign enterprise. On the other hand, as regards the efficiency of labor employed in hand-work of any kind, that labor which is locally available gives disappointing results. The common Russian labor, when comparing the duty of such a man shoveling from bank to car, picking his own ground, with Swede labor in Alaska, is generally higher, as long as the Russian works steadily. But his servile, whining disposition, protected as he is by excessive government paternalism, combined with deep-rooted adherence to the customs of a priest-ridden country, make him a dangerous member of a mining community. Chinese coolie labor was also a failure the past season, in shoveling. As I have never worked Chinese except on this mine, I hesitate to say that the Che-Fu coolies I had on sluice No. 1 are a fair sample of the race. They do not appear to compare with Californian Chinese in efficiency. My own opinion is that the late start rendered it necessary to take local Chinese instead of importing picked men from the treaty ports. Consequently only the riff-raff of the Amgoon tributers was available. At any rate, the duty of the Chinese shoveler averaged but 2 cu. yd. of gravel per 10-hr. shift, as compared with 5, which is the average in Alaska. The experience in the small amount of work done in 1908 was practically the same. Therefore, I am justified in saying that any sluicing methods used in future on the Kolchan property must eliminate hand labor as much as possible. In other words, the hand labor, apparently cheap, is not in practice cheap, but more expensive than well-paid labor in America.

As regards carpenters, both Russians and Chinese require expensive surveillance, constantly. The Chinese are superior, as they work faster and are more adept. On flume work, where exact joints are not required, a gang of six Russian carpenters is the equivalent of two Californians. On sluice-box work, I had one gang of Chinese, three in number, who worked very well after long training. It seems impossible for Russians to learn this work well.

As regards fuel, when winter cutting can be taken advantage of, it is safe to say that the price will not exceed 3 Rs. per cord, delivered. The whipsawing of lumber in 1909, of which about 50,000 board-feet were used, cost 50 roubles per thousand feet.

Freight Charges.—The experience in handling heavy pieces of freight, in the season of 1909, was as follows:

American shipment of 78 tons, about one-quarter of which was heavy pieces. Prices are in roubles per ton: Rate from Chicago to Nagasaki, 71; Nagasaki to Nikolaievsk, 32; Nikolaievsk to 'Residenz', including unloading at Nikolaievsk, barge transfer to Residenz, and unloading from barge. 26; Residenz or lake-landing to mine, 90; total, 219. These are figures for the 1909 cost for heavy pieces.

English shipment of 10 tons: Hull to Nikolaievsk, 82; Nikolaievsk to the mine was less than the American shipment, as the pieces were all small (on heavy pieces the freight would have been the same), 116; total from Hull, England, to Kolchan, 198.

From the above experience, one would be justified in assuming an estimate of £20,000, or 200,000 Rs., for a dredge shipment of 1000 tons, from either New York, Hull, or Hamburg, to the Kolchan property.

The Kolchan property, although directly on the seaboard surrounded by navigable waters, is in a region where general business and commerce are undeveloped. Very few direct steamers to European and American ports make Nikolaievsk a port of call, consequently many transhipments are necessary for machinery destined for the Amur goldfields.

Taxes.—The list of taxes given below is fairly representative of the nominal Government dues:

TAXES PAID DURING 1909

	Rs.	Rs.
Dessiatin tax.		
1909 tax	2,683.75	
Fine on same	129.00	2,812.75
Personal licenses, 1909 tax		48.00
Mine Owners' Association, 1909 levy on proportion of gold produced by each mine in the district		165.65
Judge tax, annual levy for 1909		109.00
Police expenses, paid to police as salaries from April to December 1909 inclusive (police charges are at the rate of 0.232 Rs. per month)		2,286.60
Police tax, annual levy for 1909		205.00
Church, subscription to same for 1909		100.00
Boiler tax, 1909		216.59
Fundamental industrial tax, 1909		2,147.00
		8,090.59

California Gold and Silver Output in 1909

Final figures showing the mine production of gold, silver, and platinum in California in 1909, compiled by Charles G. Yale, of the U. S. Geological Survey, have just been made available for publication. The delay in appearance is due to the co-operation of the Geological Survey with the Bureau of the Census in collecting the statistics of mineral production in 1909. The final figures for the output in California in 1909 are as follows: Gold, $20,237,870; silver, 2,098,253 fine ounces, valued at $1,091,092; platinum, 416 refined ounces, valued at $10,400. The corresponding values for 1908 were: Gold, $18,761,559; silver, $873,057; platinum, $13,414; the quantities of silver and platinum in 1908 were respectively 1,647,278 and 706 ounces. Material gains in the output of gold and silver and a decrease in that of platinum are therefore shown for 1909. The production of gold and silver in California in 1909 by counties is shown in the following table:

County.	Gold (value).	Silver. Quantity (fine oz.).	Silver. Value.
Amador	$ 2,298,785	32,118	$ 16,701
Butte	2,987,079	13,856	7,205
Calaveras	1,440,511	137,342	71,418
Del Norte	1,610	100	52
Eldorado	238,284	2,498	1,299
Fresno	17,539	16,352	8,503
Humboldt	25,690	181	94
Imperial	59,705	1,007	524
Inyo	457,846	90,609	47,117
Kern	654,799	195,448	101,633
Lassen, Modoc, and Colusa	116,327	2,813	1,463
Los Angeles	864	4	2
Madera	14,716	775	403
Mariposa	396,465	5,247	2,729
Merced and Stanislaus	228,492	1,100	572
Mono	354,909	72,677	37,792
Monterey	333	10	5
Nevada	2,660,235	47,935	24,926
Placer	281,372	2,869	1,492
Plumas	157,491	1,130	587
Riverside	186	46	24
Sacramento	1,669,814	5,492	2,856
San Bernardino	40,071	24,173	12,570
San Diego	12,812	3,310	1,721
Shasta	1,600,489	1,414,346	735,460
Sierra	189,672	1,841	957
Siskiyou	416,160	4,125	2,145
Trinity	520,046	4,427	2,302
Tuolumne	925,703	8,430	4,384
Yuba	2,469,865	7,992	4,156
Totals	$20,237,870	2,098,253	$1,091,092

Comparison of the above table with the county figures for 1908 shows that 17 counties increased their gold output in 1909, those showing the largest increases being Sacramento, with an increase of over $500,000; Shasta, and Yuba, each of which increased its gold output over $400,000; and Nevada, with an increase of over $350,000. Sixteen counties in California showed decreased production of gold in 1909, chief among which were Sierra county, with a decrease of over $200,000, and Kern, Butte, San Bernardino, and Eldorado, in the order named, each with decreases of over $100,000.

Platinum is produced in California mainly from the dredging fields along Feather, Yuba, and American rivers, though small quantities come from Humboldt, Siskiyou, and Trinity counties, in the northern part of the State.

Electric Pumping Problem

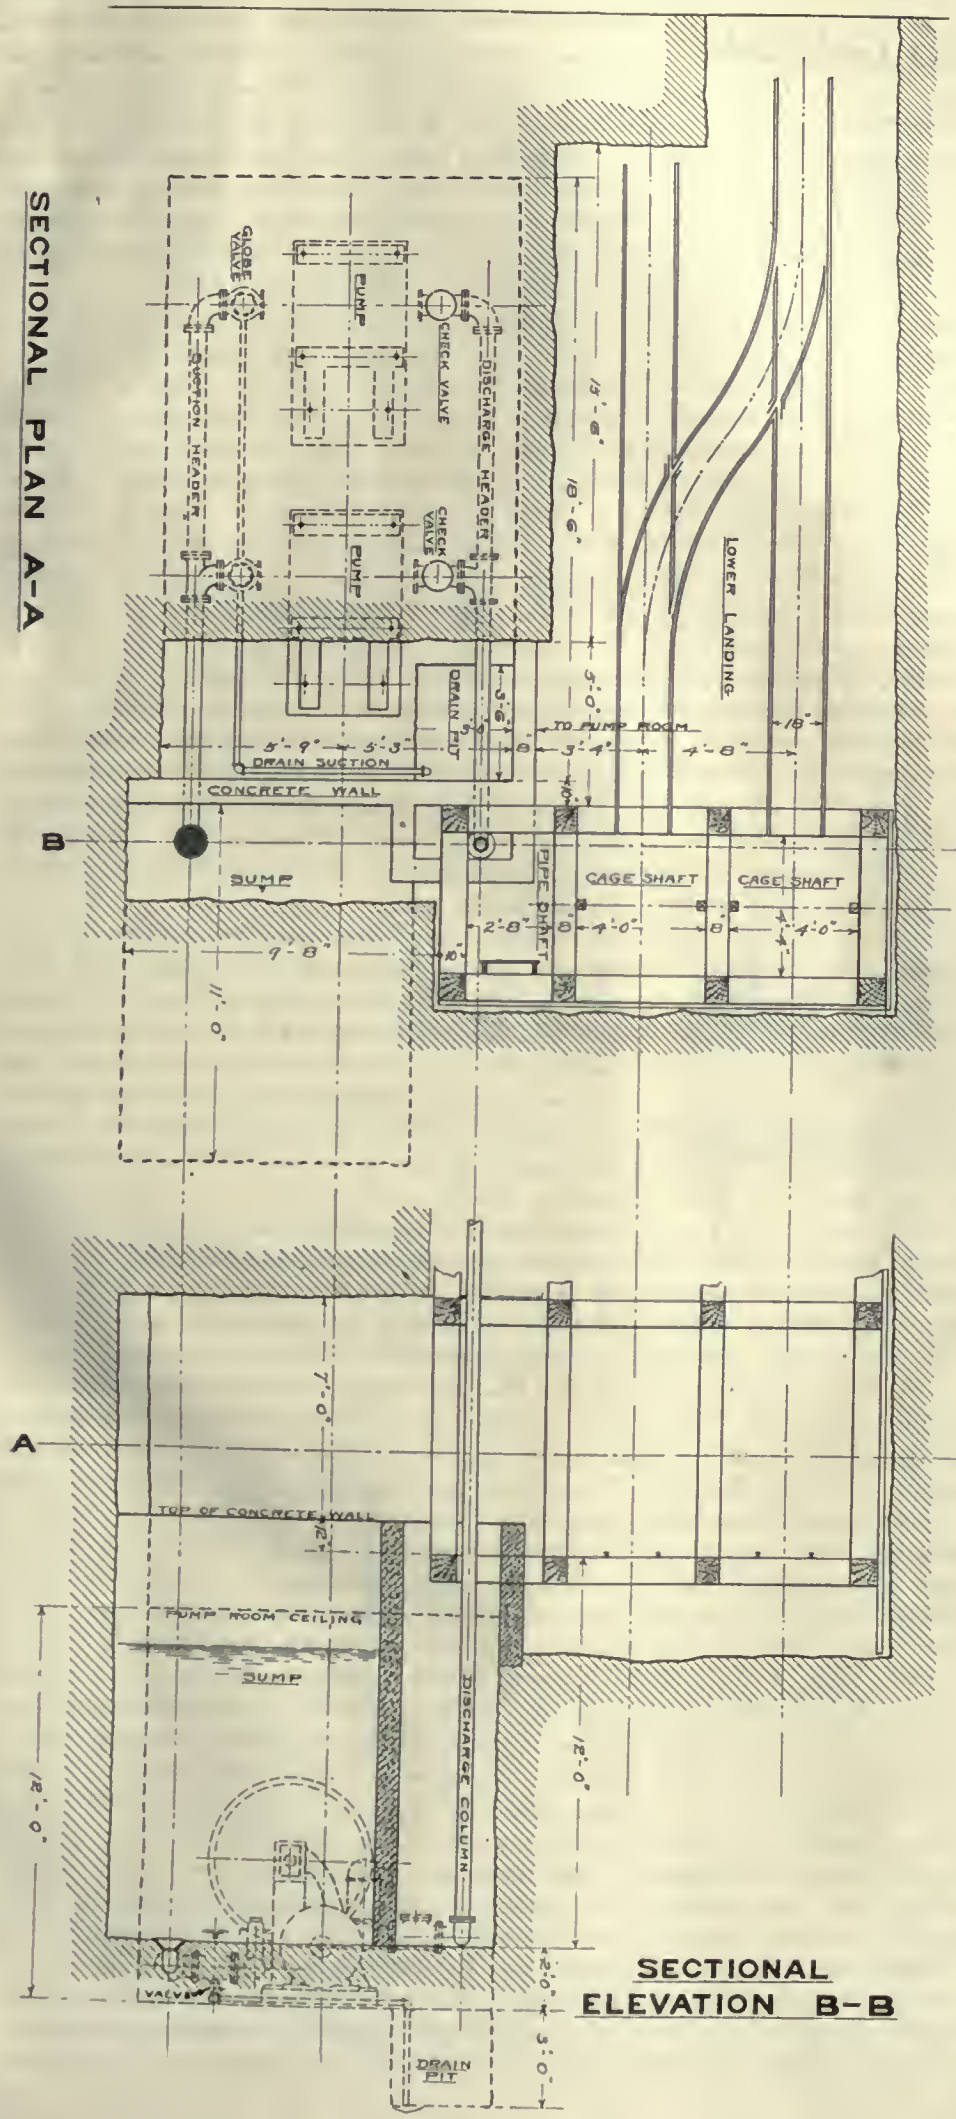
By Max J. Welch

An electric pump operates at a constant speed. The supply of water is never constant, in the case of draining a mine. The problem is, how to operate a constant-speed pump at less than its rated capacity, and do so economically.

Suppose that the heaviest flow of water into a mine is 100 gal. per minute. A portion of the year the flow is probably only 40 to 60 gal. per minute. In order to provide for emergency, a safe installation is two 100-gal. pumps, of the same manufacture. By this arrangement only one set of duplicate parts subject to wear and breakage need be carried in stock.

Three systems have been used to solve the problem of under-rated water supply: (1) with a by-pass valve; (2) a speed-shifting device; (3) periodic pumping. The first system requires little attention, but is not economical. It consists in the introduction of a water-valve between the discharge line and the supply sump. When the water-supply is low, a float automatically opens this valve and allows an amount of water to churn through the pump, without being discharged from the mine. It is readily seen that the pump is consuming as much power as if it were actually discharging 100 gal. per minute. The second system, of changeable gears, is more economical in power consumption, but requires the time and careful attention of the pumpman. The first cost of installation is greater, owing to a duplex system of gears. The third system, of periodic pumping, is extremely practical if the pumpman's time is of little value. Automatic starting rheostats are in use, but they are hardly reliable enough for mine pumping. The rheostat, as generally installed, is in the delicate position of constantly opening and closing. Practical methods in isolated regions require as little delicate mechanism as possible.

A few years ago I put in a triplex electric pump, using the by-pass system. The supply was hot water, and consequently the sump tank was placed above the valves in the pump. The breaking of this valve led to the theory that the by-pass is entirely unnecessary. As long as the water flows into the valves, the machine is a pump. When there is no water supply, the pump is an air-compressor. When the water supply is half the rating of the pump, it becomes an air-lift device; in other words, the air which passes into the discharge water column, reduces the weight of the column and takes the working load off the pump. The by-pass was closed and



the pump worked successfully. A recording watt-meter was used to measure the power consumed. It was found that the amount of electric current used by the motor was almost in direct proportion to the volume of water pumped.

The first question of doubt which arises is this, will there be any hammer in the pump, due to admitting air? Certainly not. Hammer, in a pump, is caused by insufficient water-supply, accompanied by a vacuum. If there is a vacuum in the pump cylinder at the end of a stroke, then the valve will not open on the return stroke until the water has formed a solid mass against the piston. This is the point in the return stroke where water-hammer occurs. But, if air is admitted along with an insufficient water supply, the air cushions the pump piston against the water, destroying the hammer. The drawing herewith shows the method of installing pumps below the sump. It also shows the duplicate system of pumps, one extra being held in reserve for emergency, in case of heavy repairs.

Picric acid, the high explosive material, was first manufactured in 1771, and for about 100 years was employed as a dye, its explosive character never being recognized. This substance is also known as carbazotic acid.

The Klerksdorp Goldfield

By Rowland Gascoyne

The Klerksdorp district of Transvaal from a gold-mining standpoint has been under a cloud for a good many years but recently the satisfactory manner in which the Africander mine has been opening has again attracted attention to it. However a much more important issue than that of the success of an individual mine has been raised by a discovery close to Buffelsdoorn, almost due west of Potchefstroom, and about fifteen miles northeast of Klerksdorp. Buffelsdoorn is well known as the scene of a mining fiasco almost equaling in extent that of the old Coronation Syndicate deal in the Heidelburg district, and one would naturally expect that the mere mention of the word Buffelsdoorn would have been sufficient to scare even prospectors, not to mention speculators or investors. However, such has proved not to have been the case, for despite all discouragements and difficulties two old Rand prospectors named Du Plessis and Murray have persisted in prospecting for the Main Reef series west of Buffelsdoorn, eventually succeeding in forming not only a Main Reef syndicate, but, under geological guidance, in finding a reef having many of the characteristics of the Main Reef series. In the event of the leaders recently struck proving to belong to the Main Reef series, the importance and value of the discovery of the Klerksdorp district and the Rand generally can scarcely be overestimated, as it will at once raise the first named district to the same high mining status as the Rand.

It may perhaps seem strange that in such an old gold-mining district as that of Klerksdorp the possibilities of finding the true Main Reef series should have been so long ignored. Molengraaf, state geologist to the old South African Republic, however, considered the subject, and after him, David Draper and a host of others of varying capabilities, experience, and training, with nearly as many ideas as there are individuals. It is impossible to say whether Hatch or Corstorphine have ever visited Buffelsdoorn and inspected the farms lying to its immediate west, but the latest map by Hatch shows the area to be occupied by beds older than the Main Reef series. Probably the author has depended on information supplied by others less capable of drawing deductions as to the probable deposits of soil and alluvium. If the reef now found belongs to the Main Reef series the principal cause of the difficulty would seem to have been in the inability of the local geologists to correctly identify the Red Reef while they have been disputing among themselves the true age of the Buffelsdoorn series.

Numerous views have been expressed as to the true age of the Buffelsdoorn Reefs, some identifying them as belonging to the Main Reef, and others to the Government series, but the majority regarded them as of Elsburg age. Should the beds recently found prove to be Main Reef series, the majority would appear to have correctly diagnosed the Buffelsdoorn Reefs as being contemporaneous with the Elsburg series. The question may then be asked, why in the event of having correctly correlated the Buffelsdoorn as being of Elsburg age, some well guided attempt should have not been made to find the Main Reef series. The reply to such a question is found in the fact that all the leading geologists consider the Elsburg series to be non-conformable to the Main Reef series, and therefore untrustworthy as a guide to the discovery of the latter.

Undoubtedly the most reliable guide to the Main Reef series on the Rand is the presence of either the Kimberley or Bird Reef series, and as both are claimed to be present and exposed where the Main Reef series has been found on the Klerksdorp district, it is on this point, perhaps, that some explanation is due from local geologists. Lying to the west of the Buffelsdoorn series is a reef known to local geologists as the Red Reef, and this is now claimed to be the Kimberley series instead of belonging to the Government series as hitherto supposed. It would seem therefore that the inability of the prospectors and geologists to recognize the true age of the Red Reef has led to the difficulty of establishing the exact existence of the Main Reef series, and the coloring on Hatch's map showing the country as belonging to the Lower Witwatersand formation below the horizon of the Main Reef series, has seemed to confirm that view.

An equally interesting point to remember is that not only do the discoverers of the Main Reef series claim that they have identified and proved that the Red Reef belongs to the Kimberley series, but they likewise claim to have found and opened the Bird Reef series in its proper position below the Kimberley, or so-called Red Reef, as likewise the Livingstone series; so that the existence of all the different reefs or markers above the Main Reef series is claimed to have been proved and established. It is clear that the prospectors, while being confident that the Main Reef series existed in the neighborhood, were not sufficiently well versed in geology to hit upon the right spot to look for it, because, despite the fact that the country rock was covered by 90 ft. of overburden, the well-known red bar was observable, but they were prospecting on the wrong side of it. On a geologist being called in, he not only traced all the underlying beds from the granite to the Buffelsdoorn Reef, which he identified as being in their proper geological sequence, but he measured from the supposed Bird Reef series, fixed on the position of a bore-hole to strike the Main Reef series at a depth of 600 ft, and struck a rich leader at the base of a reef, going 39 dwt. over 12 inches at a depth of 546 ft. from the surface. The discovery in itself is of course of considerable value, but should its correlation be established with the Main Reef series, it will roughly double the productive length of the Rand, the possibilities of which will now be extended from Randfontein to Klerksdorp, a distance of nearly ninety miles. About one-half of this distance at the Randfontein end is, however, covered by newer formations which will add to the difficulty of prospecting and mining. Discarding the covered area, there will still remain a distance of about fifty

miles to be proved, through which the only drawback would seem to be that in some places the ground is broken and will need careful handling. Twenty miles of well settled country can, however, be relied upon; should the present bore-hole yield of nearly 2 oz. per ton over a width of 12 inches be established even over that length, it seems almost impossible to estimate at present what it may add to the resources of the Rand. The leader first struck has a low dip to the east of about 30°, and being in a country provided with railroad facilities and easily accessible, the working costs ought not to exceed the average of the Rand. The whole matter emphasizes anew the importance of thorough prospecting of outlying districts and augurs well for the future of gold mining in South Africa.

Empire Mines Cyanide Plant

By Frank C. Landguth

The Empire mines at Grass Valley, California, G. W. Starr, general manager, put in operation on December 1 a new cyanide plant, one of the most modern in the West. It was designed by Henry Hanson of San Francisco, assisted by myself. Mr. Hanson also built the plant, being assisted by J. T. Hooper. The plant has a capacity of 150 tons per 24 hours. The building is of wood covered with corrugated iron, the framework on the inside is painted white, and all the tanks and piping are painted dark green. Electricity is used throughout for light and power, the current being delivered to motors six in number, ranging from 3 to 25 hp., at an energy of 440 volts. The site is an ideal one, as it permits the handling of all material by gravity.

The tailing from the stamp-mill flows through 425 ft. of 15-in. terra-cotta tile at 3% grade, supported on T-rail trestle, to the cyanide plant, where it is received direct by the Merrill classification equipment consisting of two settling-cones 8 ft. 4 in. diam., with sides sloping 50°, and five sizing-cones 4 ft. 8 in. diam., sides sloping 70°. To the apex of settling-cones is bolted a multiple casting tapped for 1½-in. pipe. Five of these pipes are in use, one feeding each sizing-cone. Each sizing-cone is fitted with Merrill hydraulic sizer. The pulp is here divided into two products, sand and slime. The slime overflow from settlers and sizers flows through an 8 by 12-in. galvanized-iron V-launder to a 3 by 4-ft. galvanized-iron sump filled with adjusting gates to give an equal distribution of slime to clarifiers, four in number, 24 ft. in diameter by 22 ft. deep, filled with false conical bottoms sloping 45° toward centre, and annular inside launders for clear-water overflow. This overflow is conveyed in galvanized-iron V-launder to a 20 by 16-ft. water-wash tank, from which it is drawn for various purposes.

The thickened slime, sp. gr. 1.4 to 1.8, is drawn from centre of the bottom of the clarifiers continuously through a 1½-in. pipe which discharges 9 ft. above the bottom of the tank through a special cock, fitted with chilled-iron bushing, to a 6 by 10-in. galvanized-iron V-launder which in turn conveys sludge to four agitating-tanks 10-ft. diam. by 18 ft. deep, fitted with central cylinder special nozzles for compressed air at 10 lb. pressure, conical false-bottoms sloping 50° toward centre of tank and piped throughout for continuous system of slime treatment. After agitation the slime flows to the filter department, where it is treated by two Oliver continuous filters of 70-ton capacity.

Among the new features of the plant is the vacuum pump used in connection with Oliver filters, which at 90 r.p.m. makes a 24-in. vacuum and elevates the filter effluent 41 ft. to a 16 by 20-ft. storage tank. This pump is doing excellent work and was designed by Edwin Letts Oliver. An Ingersoll-Rand 10 by 10-in. compressor, making 150 r.p.m., furnishes compressed air for blowing slime-cake off the filters, agitating sludge, and aerating the sand-charges.

The underflow of classified sand from sizing-cones is conveyed through a 10 by 10-in. wooden launder to the leaching department, where an automatic distributer charges the leaching-tanks, four in number, 24 by 10 ft., fitted with an annular inside overflow launder to carry overflow during filling, and a wooden filter-bottom of new design. These bottoms slope ¼ in. per foot toward the centre of the tank and are covered with the usual filter medium. The object in sloping these bottoms is to facilitate discharging through a 12-in. centre gate, Merrill type, with automatic sluicing machines. The sand residue is sluiced to waste through an 18-in. terra-cotta tile. The effluents from sand-vats are conveyed to sump-tanks in two 4-in. pipe-lines. These pipes are fitted with adjustable nipples so that effluent may be turned to any one of the four 20 by 10-ft. sumps. Adjacent to these sump-tanks are two automatic zinc-belts which feed dry zinc-dust to a mixing-cone where a zinc emulsion is formed by adding a small amount of barren solution. This emulsion is conveyed to the pump suctions of two 5 by 5-in. Aldrich triplex pumps, specially designed for handling cyanide solutions, which elevate the solution to two Merrill precipitating-presses of 250 tons capacity. Precipitated solution from presses flows to a 20 by 16-ft. storage tank. So far results show that the plant will be very efficient. I hope at an early date to be able to give a detailed description of the metallurgy.

Cyanidation Plant, Empire Mines.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Sinking the Lightner Shaft, Angels, California

The Editor:

Sir—I have read with interest and surprise an article on 'Sinking the Lightner Shaft, Angels, California,' in your issue of February 4, and the costs as therein given have prompted several questions that I should greatly like to have answered by your correspondent.

It is stated that four baby drills were employed, and yet only four miners on a shift. From this it is inevitable that they chucked their own machines. But from my own experience in shaft-sinking a baby drill has not enough power to throw the mud properly for rapid drilling, particularly on flat cut holes, and is hence less satisfactory, and often more trouble to chuck, than a large machine that always requires the attendance of two men. But presuming that your correspondent was not misinformed, and four men ran four drills, how deep did they drill their holes, and how many holes to a round? Only one labor item is given, namely, $15.70 per foot of sinking. Does this include the engineers on the winze hoist, and the timbermen who placed the sets?

SUPERINTENDENT.

Jackson, California, February 6.

Nichrome Wire

The Editor:

Sir—While working with an alloy of nickel and chromium in the form of a resistance wire, its resistance to the common laboratory fumes and to oxidation at the temperature which it is possible to obtain with the ordinary blast lamp, made it occur to me that this wire might be used to advantage to replace the ordinary platinum triangle.

Several triangles were made by twisting together the ends of three pieces of No. 13 nichrome wire (a larger size could be used with advantage), each about four inches long. The triangles made in this manner were used to support platinum crucibles, which were ignited side by side with others supported on platinum and on common pipe-stem triangles. The crucibles showed about the same loss in weight when ignited by the same means on any of the triangles mentioned. This was true whether they were ignited over a Bunsen burner, blast lamp using city gas (containing a large amount of sulphur), or a gasoline blast lamp. The nichrome triangles when used with city gas, either over the Bunsen or the blast, lost at most one milligram per hour, and at times showed a slight gain or no loss at all When the gasoline blast was used (this did not contain any sulphur) the loss of either the crucibles or the triangles was not more than 0.2 or 0.3 milligram per hour. One of these triangles will outlast a number of pipe-stem triangles and at the same time allow a higher temperature to be obtained in the crucibles. In fact they make a good substitute for the platinum triangle and cost much less. This article has been put on the market by C. H. Stoelting & Co. of Chicago.

R. C. BENNER.

Phosphate Discoveries

The Editor:

Sir—Your editorial remarks on page 128 of the issue of January 21, 1911, apropos of a recent discovery of phosphate rock in Montana by Hoyt S. Gale of the U. S. Geological Survey, seem to me to call for some statement more in keeping with the known facts.

In May 1903 I made the first technical examination ever made in the inter-mountain region of an isolated deposit of phosphate rock, in Rich county, Utah. This was the inception of the discovery of the phosphate field of Utah, Idaho, and Wyoming, and as the result of "careful scientific examination" I personally located at least 80% of the present economically available deposits in that field, during 1903, 1904, and 1905. My letter files during this period show the extensive and accurate information supplied by me to the U. S. Geological Survey, and in the *Engineering & Mining Journal* of May 18, 1907, you will find the first description ever given of 'Phosphate Rock in Utah, Idaho, and Wyoming,' by myself. This paper was an extract from one prepared at the request of the Survey, to appear in 'Contributions to Economic Geology' for 1906. The Survey saw fit to publish another article in that volume, in which I was completely ignored. In Bulletin 430-H, 'Phosphates, 1910,' my early work in the field is grudgingly acknowledged in a few lines that are not even faint praise. I sometimes wonder if this is the usual treatment accorded the independent engineer by the Survey. In regard to Mr. Gale's recent "discovery" in Montana; Bulletin 430-H was written by him, based on work throughout the Idaho, Utah, Wyoming field in 1909, and the Montana section is but an extension of the general field, and Mr. Gale certainly had all the results of others' and his own extended observations to guide him. It is a fact that previous to 1903 openings in the "black stuff" in this field had been shown to members of the U. S. Geological Survey without the nature of the deposits being recognized or suspected. In conclusion, I beg to quote you a few sentences from the paper submitted the Survey January 23, 1907, which paper, as I have remarked, was returned as unavailable.

"An examination of the geologic folios of Carboniferous areas in the inter-mountain section shows a constant reference to chert and black or dark beds at the horizon in question, and I feel convinced that future search with the key afforded by the investigations already made will greatly enlarge the field. Much of the country is at present commercially inaccessible. A wise Providence seems to have made the Carboniferous coal-bearing in the Appalachian and phosphate-bearing in the Rocky Mountain

region: the difference arising in the one being a swamp with a collection and laying up of vegetable material, and the other a shallow sea with the deposit by animal, vegetable, and chemical means of the vast amount of phosphoric acid borne by it from the degradation of the land areas. It behooves the Government of the United States to preserve for future generations this great storehouse of phosphoric acid so essential to the well-being of any nation, and not to allow it to be distributed to every other nation for the temporary benefit of a few dollars. This can be accomplished now when the private holdings are comparatively small and the bulk of it is still to be discovered on the public domain. It would seem to be a legitimate function of the U. S. Geological Survey to have control of the matter."

In contrast to this, in 'Phosphate Deposits in the Western United States,' Bull. U. S. Geol. Survey No. 315, 1907, in the Introduction, the report reads:

"The discovery of these beds has opened up a new industry in the West, the future of which is largely dependent on the granting of such rates by the railroads as will enable the manufactured product or raw material to be sold at a profit in Australia, Honolulu, Japan, and the Middle States, the home market on the Pacific Coast being at present a somewhat limited one."

C. Colcock Jones.

Los Angeles, California, January 24.

[Our reference was of course based on the published record and the contrast we had in mind was not between official and private work, but between well directed scientific surveys such as Mr. Jones undertook, and chance prospecting. It would have been more accurate had we said that previous discoveries had been *mainly* by accident. In giving credit in this case to the geologist, we gladly include Mr. Jones. There can be no greater mistake than the assumption that there are no geologists except those officially designated as such.—Editor.]

Montana-Tonopah Mill

The Editor:

Sir—My attention has been directed to some remarks in a review of your book, 'More Recent Cyanide Practice,' which appeared in the issue of November 12 last, in which several statements are made which do an injustice to the design of the Montana-Tonopah mill, Tonopah, Nevada. Your critic, who writes under the initials of 'C. C.', remarks: "As a sample, Rotherham's article on the Montana-Tonopah mill may be cited. That article was a striking one when published, and Rotherham's clear, concise style of writing pictured the mill admirably to readers of the article. * * * The practice of today at the Montana-Tonopah is now different from that described in the book." Further on he remarks: "All these were admirable at the time of publication, and are yet valuable as a matter of cyanide history, but *in the sense of reliable data concerning modern practice*, are misleading." In fairness to the Montana-Tonopah mill, and to F. L. Bosqui, the distinguished metallurgist who designed it, I wish to point out the inaccuracy of the foregoing statements. The metallurgical practice at the Montana-Tonopah at the present time is practically unchanged from the date when the mill originally started crushing, some twelve months before Mr. Rotherham's article was written. Slight changes in minor details, such as the addition of a melting-room with furnaces for the reduction of cyanide precipitate to bullion, have been added, but these were contemplated when the mill was built, and in any case they do not affect the milling practice. Moreover, as a matter of fact, no important advance in metallurgical practice in the milling and cyaniding of silver ores has been made in the Western United States since the Montana-Tonopah mill was built. The use of tube-mills, vacuum-filters, and zinc-dust precipitation was all incorporated in the original mill. Furthermore, several of the most modern mills recently erected, or now in course of erection, in the United States and Mexico, for the treatment of similar ores, follow closely the practice as originally in use at the Montana-Tonopah. Therefore, I claim that the description of the Montana-Tonopah mill referred to, not only describes present practice at the mill, but that the data furnished should be considered as relating to the most modern milling practice.

Edgar A. Collins.

Tonopah, Nevada, January 26.

An experimental coal mine is to be opened by the U. S. Bureau of Mines in order to demonstrate to miners and other persons that the valuable results obtained in the explosives chamber at Pittsburg are not merely laboratory experiments. J. A. Holmes, the director, has arranged to carry out the same experiments in a coal mine and by an arrangement with the Pittsburg Coal Co. a certain coal property in Brucetown, Pa., has been obtained for these purposes. A new mine will be started under Bureau supervision, in which all sorts of experiments will be possible. Blown-out shots will be reproduced with permissible powders in the presence of gas and coal dust. Black powder will also be used, the shot being fired by electricity from the outside. Short circuits of electric wires in rooms filled with coal dust or with gas will also be attempted. The various remedies for rendering coal dust harmless will be tried, and many important tests in mine ventilation are promised. It is said that miners who have witnessed the destructiveness of coal-dust explosions in the explosives gallery have said that such things do not occur in coal mines. The experts of the Bureau are satisfied that such do occur, but are willing to demonstrate beyond the possibility of any doubt.

The diamond-drill is more serviceable in searching for large orebodies than for those that are small. Great orebodies can be blocked out satisfactorily, but small veins are likely to convey misleading information when intersected by the diamond-drill. Much depends upon the systematic distribution of the holes. Reliable results can only be secured by proceeding methodically.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Quicksilver in large amount has been obtained from the Terlingua mines of Brewster county, Texas.

Antimony and quicksilver do not readily form an amalgam. There are few mineral substances more objectionable in the metallurgy of gold and silver, than antimony in any form.

The damper of the boiler fire-box should never be closed entirely when there is fire on the grates, as gas may collect and result in an explosion as destructive of property as a boiler explosion.

The carbides are the result of the union of carbon with a metal, calcium carbide being the combination of the metal calcium with carbon. The carbides are all artificial and are the product of the electric furnace.

The pneumatic-hammer drill is an excellent device for taking samples in hard veins, as by its use channels of even width and depth may be readily cut. These machines have been used for this purpose to great advantage.

When cyanide solution containing gold passes rapidly through the zinc-boxes only a portion of the gold is precipitated. It is necessary, for good precipitation, to have the current flow slowly, particularly with weak solutions.

Black diamonds, to be used in the diamond-drill, that do not throw off small fragments when struck a blow with a hammer, are useless for drilling, so say some experts. The person attempting this test of carbons should only do so under the careful instruction of an experienced man. A mistake is expensive, as carbons are costly.

In California it is not probable that the entire extent of the profitable oilfields has been determined. There remains much territory to be proved, and there is likelihood of finding profitable oil in untried fields. It is also probable, however, that wells in such districts will have to be deep. Some of the wells have failed and others show signs of weakness. Undoubtedly either a decreasing of oil, or a demand for crude oil in excess of the supply must result in a general revival of interest in the oil business in California.

Pulverizing devices are numerous. It would be difficult to name the various machines that have been introduced for pulverizing ores within the past 30 years. A large number of them were useful and found favor with mining men, but by far the greater number were of no use whatever, other than to show how pulverizers should not be built. They comprised ball-mills, rolls, grinding-pans, hammers, centrifugal and pneumatic devices, each of several varieties. In the designing of a crushing or pulverizing mill the chief things to be considered are: low first cost, as related to capacity; inexpensive operation; few and inexpensive repairs; a perfectly pulverized product, a simple machine, with parts easily replaced. In addition to these there is always a certain amount of prejudice to overcome. A good machine will make steadfast friends, but often the inventor finds it a slow and discouraging process. Merit, however, usually wins.

Separating oxygen from the air, says James Swinburne, is not the same as making liquid air. To separate oxygen from nitrogen involves doing mechanical work, which is converted into heat. A rectifying plant may be considered as an apparatus, which takes in heat substantially at the boiling-point of the liquid with highest boiling-point, and gives it out at a lower temperature near the boiling-point of the most volatile liquid. An air separator thus takes in heat at 90° A, gives out heat at about 82° A, and at the temperature of the works, say, 273° A. The Linde process may be regarded as a rectifying plant of this sort, and a thermodynamic engine, in which a gas is compressed so as to liquefy at 90° A under pressure, and to evaporate at 82°, thus supplying the heat at the boiling-point of the oxygen, and absorbing it at the boiling-point of the air. Such a process is generally considered irreversible, but is in fact nearly reversible and therefore economical. Assuming an efficiency of 40%, the cost of oxygen comes out approximately one shilling per ton on a large scale. This ought to lead to its use in blast-furnaces and other cases where an extra high temperature may be important.

The largest mass of gold ever found free from quartz, of which there is any record, was that taken out of the Byer & Haltman mine, Hill End, N. S. W., May 10, 1872. It was imbedded in blue slate 250 ft. from the surface. It weighed 640 lb. and was 57 in. long, 38 in. wide, and averaged 4 in. thick. It was valued at $148,800. The Welcome Stranger nugget was found on Mt. Moliagel, Australia, Feb. 9, 1869. It weighed 190 lb. and was valued at $45,000. The Welcome nugget was found at Bakery Hill, Australia, June 9, 1859. It weighed 184 lb. 9 oz. and was valued at $44,356. The nugget found August 18, 1869, in the Monumental quartz mine, 12 miles north of Downieville, Sierra county, California, was the largest piece of gold ever found in the State up to that date. It weighed 1142.25 oz. or 95½ lb., cleaned, and was worth $21,156.52. It was found in decomposed quartz 25 ft. from the surface. A pocket was discovered in the Bonanza mine, at Sonora, Tuolumne county, California, in the early days of that mine, about 350 ft. from the surface. This pocket produced $360,000, and the central mass of solid gold was worth $40,000. It is claimed that nearly $3,000,000 was taken from a hole on the Morgan mine, 20 by 20 by 30 ft., on the summit of Carson hill, Calaveras county, California, in 1851. This latter has probably been exaggerated somewhat, though there is no doubt a large amount of gold was taken from that place.

Special Correspondence

LONDON

Zinc Production at Broken Hill. — Milling Methods. — The Sulphide Corporation and Minerals Separation Co. — Amalgamated Zinc. —Broken Hill Block 10.—Elmore Process.

The news relating to the zinc production at Broken Hill is published more quickly and completely in London than in Australia, so I owe no apology to your readers for treating them this week to a disquisition on this subject. I will begin with the Sulphide Corporation, which was formed originally in 1895 by Gibbs Bright & Co., of Melbourne, and the Exploration Company of London, to acquire the Central Mine at Broken Hill and the Ashcroft wet electrolytic process. Subsequently, this method of treating the ore was abandoned, and at about the same time the Exploration Company withdrew. The ore is now treated for lead by jigs and tables, and the zinc tailing by the Minerals Separation process. For a long time the ordinary shares received no dividends, but payment was resumed for the year July 1908-9, when 10% was distributed. The preference shares have received 10% per annum to date. During the year ended June 30, 1910, the company has been highly prosperous and the preference shares (£550,000) and the ordinary shares (£412,500) both received dividends of 15%. Production at the mine has continued uninterruptedly and 231,748 tons was raised. The lower levels have additional reserves which now stand at 2,702,000 tons. The ore raised yielded 51,342 tons of lead concentrate assaying 61.8% lead, 9.4% zinc, and 28.4 oz. silver. The tailing and slime, together with 47,129 tons of dump tailing, were treated in the zinc plant and yielded 88,767 tons of zinc concentrate, assaying 43.5% zinc, 11.2% lead, and 14 oz. silver. Plant is now being erected for the purpose of re-treating this concentrate in order to remove some lead and increase the zinc content. The lead concentrate is smelted at the company's works at Cockle Creek, where a new smelter is in course of erection. Most of the zinc concentrate goes to Germany and some to the Central Zinc Co.'s works at Seaton Carew in the North of England. It is notable that by the present arrangement of the concentration plant, the whole of the ore is beneficiated, the slime going to the flotation plant along with the zinc tailing.

While writing of the Sulphide Corporation it will be of advantage to say something of the Minerals Separation company which is treating the zinc tailing. The company owns the Sulman-Picard-Ballot-Hoover flotation patents for the concentration of sulphide ores. The plants are situated at the Sulphide Corporation mine, Broken Hill; one plant owned by the corporation treats current zinc tailing at a royalty, and the other, belonging to the Minerals Separation company, has been treating old zinc tailing dumps of the corporation. The dump plant treated during 1909, 193,842 tons and produced 68,532 tons of concentrate assaying 46.8% zinc, 8.9% lead, and 14 oz. silver, at a treatment cost of 7s. 9d. per ton. During the 9 months, January to September 1910, the amount treated was 179,218 tons, yielding 62,775 tons of concentrate assaying 46.9% zinc, 9.4% lead, and 14.2 oz. silver at a cost of 7s. 6d. per ton. During the last part of the period the cost had been reduced to 6s. 8d. per ton. The Sulphide Corporation dump was then exhausted. The whole dump had contained 481,859 tons for which Minerals Separation had paid £177,686 in cash. The plant cost £25,903 and the treatment cost £142,722. The concentrate produced sold for £492,955, and after paying brokers' commissions, etc., the net profit was £120,788. Since October 1 the plant has been working on lower-grade tailing, paying no purchase price to the Sulphide Corporation, but sharing the profit equally. The company is erecting plant at the Great Fitzroy copper mine in Queensland; also at a copper mine in New South Wales, and at a zinc-lead mine in Finland. Arrangements have been made to work the process actively in North America by means of a subsidiary syndicate, for whom E. H. Nutter and James Hyde will act as technical advisers. An interesting improvement in the process not before recorded is that whereby the first flotation produces a zinc concentrate high in lead and the second a zinc concentrate low in lead. The advantage of this is that in the subsequent dressing out of lead on Wilfleys much less material has to be sent over the tables than when one uniform product is made. Unfortunately the company is still in the midst of lawsuits. Two have been commenced; one against the Zinc Corporation for breach of contract, and one against the Amalgamated Zinc (De Bavay's) for infringement of patents. Actions in which the company's process is implicated have been taken against the Sulphide Corporation by the Elmores and by the Potter company. Under the circumstances the company is not distributing any dividends, but conserving the large cash profit it has made. The most unfortunate lawsuit of all is one against Theodore J. Hoover, who has been engineer to the company in London for the last three years and during that time has improved the mechanical process in many important ways. His engagement terminated on December 31 last, and the company has since

Map Showing Position of Broken Hill.

applied to the Court of Chancery to prevent his retaining certain records.

Another company engaged in concentrating zinc tailing at Broken Hill is the Amalgamated Zinc (De Bavay's). This company was formed in Melbourne in September 1909 for the purpose of expanding the operations of the De Bavay Treatment Co., which owned the De Bavay flotation process for producing zinc concentrate from Broken Hill tailing. During the half-year ended September 30 last, 160,957 tons of tailing was treated, producing 47,448 tons of zinc concentrate assaying 48% zinc, 7.12% lead, and 7.28 oz. silver, and 767½ tons of lead concentrate assaying 54% lead, 11.8% zinc, and 23 oz. silver. The second unit of the new plant commenced work in August, the old mill being at the same time abandoned; and the third new unit began operating at the end of October. During the first part of the half-year therefore the output came from the first new unit and the old mill, and during the latter part from the two new units; the third and final new unit did not come into operation until after the expiration of the period under review. When the company was formed £150,000 was

estimated as the expenditure required for erecting the new plant. Owing partly to the difficulty of obtaining efficient labor this estimate has been exceeded, and the figure eventually will be about £190,000. Some of the extra expenditure is due to improved methods introduced since the company was started, the increased capacity thereby gained having an important influence on profits. During the half-year the income from sale of concentrate was £135,057 and the profit was £43,390. Out of this £10,000 has been allowed for depreciation and £25,000 has been placed to reserve. The half-year commenced with a balance of £28,816, and the balance on September 30 was £37,206. Since the close of the year a dividend of 1s. per share has been distributed and the intention is to declare dividends quarterly. During the half-year the options on the remaining 122,500 shares have been exercised, so the whole of the £500,000 capital has now been issued. The company still has dump material to treat and has long contracts for the current output of the Broken Hill South, North Broken Hill, and Block 10 mine. The report mentions that the company is defendant of a suit brought by the Minerals Separation Co. for infringement of patents.

The work at Broken Hill Block 14 mine is restricted to winning carbonate ore left behind in the upper levels. During the half-year ended September 13 last, 12,420 tons was raised averaging 31% lead and 14¾ oz. silver, as compared with 12,876 tons averaging 32% lead and 16.4 oz. silver during the previous six months. As regards further supplies, F. Voss Smith, the manager, finds it impossible to give any estimate; though few solid bodies of ore are left, prospecting and reopening of old stopes is bringing to light small bodies of ore. It is probable that the mine will continue to yield for sometime. Little has been done in mining the sulphides, the reserve of which amounts to 220,000 tons averaging 12% lead, 9% zinc, and 8½ oz. silver. About 500 tons has been raised for the benefit of the Murex company which has erected a plant on its own account for the purpose of testing the process. It has proved successful in obtaining a mixed sulphide concentrate from the crude ore, but the necessary plant for the second part of the process, that is, separating the mixed sulphides, is not yet in working order. During the half-year the carbonate ore was sold to the Proprietary company for £24,891, and the net profit was £5278.

In a review of the zinc position published in your issue of January 7, it was mentioned that work at Broken Hill Block 10 mine had been suspended for three months at the beginning of 1910 owing to the coal strike. Work was resumed on April 18 and has continued since. During the half-year ended September 30, 53,558 tons of sulphide ore was mined and 53,025 tons sent to the lead plant. This ore assayed 12.4% lead, 13.9% zinc, and 12½ oz. silver. The lead concentrate produced amounted to 7608 tons assaying 59.25% lead, 7.6% zinc, and 34 oz. silver. It was also stated that arrangements had been made to treat the zinc tailing by the Elmore process instead of selling it to the Zinc Corporation and the Amalgamated Zinc (De Bavay's) Co., and that four units capable of treating 800 tons per week commenced operations at the end of June. The results obtained were not satisfactory and the plant was closed at the end of September. During the time it was running 3548 tons of zinc tailing was treated, assaying 17.58% zinc, 3.77% lead, and 7.84 oz. silver, and the yield of concentrate was 964½ tons assaying 43.63% zinc, 9.6% lead, and 20.91 oz. silver. The recovery was 67% of the zinc, 69% of the lead, and 72% of the silver. The performance of the plant varied, and the slime was not amenable to the treatment. It seemed probable that the plant would have to be greatly enlarged in order to make a profit. The acting manager, J. N. F. Armstrong, was of the opinion that the recovery could be improved with practice, but the board decided to revert to the old custom and sell the tailing to the De Bavay company. One reason for encouraging them to do this was that they had no satisfactory contract for the disposal of the zinc concentrate, whereas the De Bavay company had. Probably the fact that W. L. Baillieu has a large say in the direction of both companies had some influence on this decision. During the year the lead concentrate was sold for £46,509, and the credit for zinc concentrate sold but not paid for and for other small items of income brought the total revenue to £56,490. On the other side of the accounts the working expenditure came to £60,481, making a loss of £3991. Out of the tailing reserve account of £22,991 carried forward from the previous half-year, it was possible for the company to distribute £15,000 as dividend, being at the rate of 3s. per £10 share. As regards the developments in the mine the main shaft is now down 1715 ft. and a new level is being opened at this depth.

FAIRBANKS, ALASKA

Drilling Company Organized. — Discoveries of Rich Ore. — Progress Made by Lessees.—Bank Suspension Ties up Money.

A party of business-men, in December, incorporated the Fairbanks Core Drill & Mining Company, with a capital stock of $25,000, and no move will be made to sell any until spring, or soon enough to get at least two drills in by the first boats. The object of the company is not only to drill holes at so much per foot, but also to acquire interests in quartz or placer properties for prospecting same. The directors are R. L. Palmer, Roy Hall, R. C. Wood, E. H. Mack, L. M. Drury, George Hunter, and E. A. Suter. E. H. Mack is manager. The Fairbanks Quartz Development Co. has also been incorporated, and its primary purpose is to determine the future of at least one of the quartz mines in the district and to stimulate the industry in a legitimate way. One of the most important discoveries in the camp was made on the Friedrich property at the head of Vault creek. This was in the shaft of the Peterson lease at the 75-ft. level. The shaft was sunk through the edge of a rich orebody, from which picked samples could be taken that would pan from $5 to $10 per pound. Three samples taken across the 2-ft. ore-shoot showed, respectively, $1057, $1257, and $2224 per ton. A shipment of 3½ tons of ore from the Cook Bros.' property on Fairbanks creek gave returns in the local test-mill of $73 per ton. There is in the bottom of the 50-ft. shaft a foot of ore, samples of which assayed $290 per ton. It is thought another good shoot of ore has been encountered. Just below these claims Goyette and Jacobson have a promising property. A shipment of 3 tons gave returns of 13.1 oz. assaying $74 per ton. More ore is to be taken out and hauled to the mill in town. Close to Cook Bros.' mine, August Hess is working on a vein that may make a mine. Rich ore has been found carrying coarse gold. A piece of quartz from the Rhodes-Hall mine on Bedrock creek weighs over 300 lb. and contains considerable free gold. The property on Bedrock creek is looking better, and at the end of the 700-ft. adit the vein was again found and has been followed a distance of 80 ft. The ore is shipping grade. Another adit has also been driven this winter at a level about 150 ft. higher.

The Calvin lease, on the Pioneer quartz claim, has a vein of rich gold quartz. This property is on Chatham creek and is one of the first claims located for quartz. When Mr. Furstenau gets back, Mr. Calvin will probably sink 300 ft. on the lease held on the Jupiter-Mars property. The lease taken by Sherrard and Golden on the Heshberger-Buell-Phipps property bids fair to be a profitable one. At the bottom of a 40-ft. shaft the ore-shoot was found by driving to the east. Some of the ore assayed $208 per ton. A shipment of 30 tons will soon be made to the Chena custom mill. A mill-run on 7 tons from the Buell lease on Willow creek gave returns of $25 per ton. More ore is being taken out that is thought to be of higher grade. Work on the Spaulding-Clough property at the head of Dome creek has been suspended until a boiler and hoist can be installed. Some driving was done on the 100-ft. level. Besides good ore in the shaft, there are known to be veins on both sides that may be opened. Except for the distress caused by the suspension of the Washington-Alaska Bank, the outlook for development of the quartz properties never looked so favorable as now.

SALT LAKE, UTAH

Metal Production for 1910.—Coal Output.—The Ohio Copper. — The Tooele Smelter.—Park City Mines.—Tintic District.

Advance reports of the local office of the United States Geological Survey show that the gross value of the mineral production of Utah during the year 1910 was in excess of $33,000,000, an increase over 1909 of about $1,600,000. Dividends exceeding $8,000,000 were paid by 18 different companies. Ore mined amounted to 6,163,089 tons, an increase of 1,000,000 tons over 1909. Seventy per cent of the total came from the porphyry deposits at Bingham; 11% of the total was shipped direct to the smelters and the rest was milled, all but a small portion being concentrated. Copper production was 126,000,000 lb., an increase of 14,000,000 lb. Production of zinc was materially increased and this increase in copper and zinc tended to an increase in the production of gold and silver, notwithstanding the fact that there was a decrease in the production of lead. The Government Assay Office at Salt Lake purchased gold and silver bullion to the amount of $916,305. Total production for the year was as follows: gold, 239,499 oz.; silver, 11,782,990 oz.; lead, 112,209,256 lb.; copper, 126,000,000 lb.; zinc, 15,337,367 pounds.

The production of coal for the year (State Coal Mine Inspector's report) was 2,526,093 short tons, an increase of 204,000 tons; and of coke, 146,064 tons, a decrease of 35,000 tons.

The output of the Utah Copper Co. for December 1910 was 7,137,585 lb., a decrease of 331,415 lb. from November. More rumors are extant concerning the Ohio Copper Co., the latest one being that the Heinze interests including the Mascotte tunnel will be taken over by an Eastern syndicate which will take up the remainder of the authorized bond issue, pay outstanding indebtedness, and complete the mill. The Tooele smelter is now showing a small surplus as the result of its operations. International stock is now paying 8%, the profits coming from the refinery at Raritan, New Jersey. The tunnel heading of the Utah Metal Co. has passed through the lime belt, and is now being driven through a porphyry dike. The side-line of the Bingham Metal Mining Co. has been passed, and driving is now in the Sunset group. Mrs. F. Kent Smith, of Butte, Montana, has been awarded a Carnegie hero medal and monthly allowance of $80. Her husband, F. Kent Smith, while assistant superintendent of the Utah Copper Co., lost his life in attempting to rescue an Italian miner lost in a winze in which gas had been tapped.

One of the most important ore discoveries in the history of the Park City district has been made in the Andes claim, owned jointly by the Silver King Consolidation and Silver King Coalition. The find was made by the Consolidated and the extent has not been determined. It was made in a fissure vein, the ore being found in the vein proper, and in bedded deposits on the sides. An assay, made without sorting wall-rock from ore, showed 50% lead, 40 oz. silver, and $3 to $4 gold. At the Daly-Judge the water on the 1600-ft. level has been reduced to 500 to 600 gallons per minute; the old water course has been avoided in the new work, and for the first time the drifts in this mine have been extended into quartzite. A considerable tonnage of milling ore is available on the lower level, which will be developed when the shaft is sunk to a level which will connect with the Ontario drain tunnel. In the old California mine, in Thane's Canyon, which is in the hands of lessees, a 6-ft. vein has been opened containing zinc and lead. The ore is being shipped to the Huff electrostatic mill at Midvale.

The new pumps in the Centennial Eureka, Tintic district, have brought the water to the point where it was considered safe to shoot out the concrete bulkhead put across the drift on the 2250-ft. level. As soon as the extra flow brought on from this drift is thoroughly under control the workings on this level will be extended. The Grand Central has shipped 12 to 14 cars of ore from stopes between the 2000 and 2100-ft. levels. The ore consists of copper, accompanied by gold and silver. The Grand Central has become involved in another suit with the Mammoth. This time the latter is complainant, the suit being to determine the ownership of a triangular piece that is overlapped by claims of each company. The Scranton mine has a new railroad spur by which ore shipments may be increased to 1000 tons per month. The 1900-ft. level of the Eagle and Bluebell, through which the King William is being operated, has been extended 200 ft. into the ground of the latter in which are stringers of manganese, iron, and calcite. The cross-fissure, which is the objective point, is about 75 ft. ahead. The Eagle and Bluebell people recently opened a body of ore which assays 40% lead and 100 oz. silver. Manager's report on the Sioux Con. shows that the cash balance was increased $75,000 during the last year, $165,000 net profit was made, and dividends amounting to $90,000 were paid.

DENVER, COLORADO

Labor Trouble. — Report of Legislative Committee. — Cripple Creek News.—Celebration at Leadville.

The strike in the northern coalfields seems farther from a settlement now than ever. Conditions became acute late in December, when, through the laxity and sympathetic attitude of the town marshal at Lafayette, the striking miners were emboldened to such an extent that they disregarded the injunction protecting the employees and property of the Northern Coal & Coke Co. As a result 16 of the offenders are now serving a one-year jail sentence for contempt of court. Friends of the miners have brought the matter to the State Supreme Court by asking for a writ of supersedeas. The argument advanced is that the lower court exceeded its jurisdiction and has seized and imprisoned men without due process of law. The court has taken the case under advisement. Unless the decision favors the labor organization there will be radical measures regulating the issuance of injunctions introduced into the present legislature. The legislature now in session has appointed a committee to investigate conditions in the affected district.

The report of the committee appointed by Governor Shafroth to study the conditions in the several coal mining districts of the State and to recommend changes in the present laws has been presented to the legislature. The committee finds that the present system is inadequate and ineffective, because of the limited number of inspectors. Seven resident inspectors, subject to the chief coal mine inspector, are recommended, and, in addition, a commission of three experts with discretionary power to close mines that are not safe is to be created; the expense of this supervision is to be met by a tax of 1c. on each ton of coal mined. The remainder of the report is also sensible and reflects credit on the committee. It is to be hoped that if these suggestions are adopted the selection of inspectors and members of the commission will be made on a strictly civil service basis.

The Roosevelt tunnel has been completed without encountering any underground lakes or dangerous water-courses, as some of the newspapers predicted. Cripple Creek operators are enthusiastic over this method of drainage, and the Tunnel Association has called for estimates on a lower tunnel. A lateral is now being driven from near the bottom of the El Paso drill-hole to cut the C. K. & N. vein which was the cause of flooding the El Paso mine. The wrecking of the upper Granite mine plant by an explosion of dynamite and the burning of the Abe Lincoln shaft-house are two rather sinister events to chronicle so early in the year. Incendiarism is suspected in both cases. The milling of the low-grade ores of the district is the live topic of the camp. With the new Portland mill in successful operation, and the promise of a new unit to be added to the Independence mill, and construction work already begun on the Ajax mill, the operators of the mills at Colorado City are becoming worried. The Clancy electrochemical process is being tried out on the Ajax ore and if successful will be the first installation of that process in the camp. There is a persistent rumor that the Golden

Cycle mine and mill have been sold to the Consolidated Gold Fields of South Africa. The coal lands of Colorado Springs are not included in the deal.

It may be difficult to figure out just what connection Robert Burns ever had with mining, but a stranger in Leadville on January 25 would have guessed him to have been a patron saint of the industry. The Scottish society was celebrating his birthday and the whole city joined in the festivities in recognition of the returning prosperity of the camp. A feature of the occasion was the luncheon served in a zinc carbonate stope on the eleventh level of the Wolftone mine. A new $5,000,000 corporation, known as the Moose Smelting & Refining Co., is reported as about to erect a smelter at Alma. As there is already one smelter in this small camp there promises to be competition keen enough

Portal of Roosevelt Tunnel.

to satisfy the most ardent opponent of the smelter trust. The local papers have been full recently of reports of a rich ore discovery at Kremmling. Rich pockets of ore are said to have been found and a few people have staked claims on the snow in anticipation of a rush to the district in the early spring. The latest rumor is that a railroad is to be built in to Kremmling.

BUTTE, MONTANA

Record of January Operations. — Electric Power and Compressed Air to Supplant Steam. — Anaconda Company v. Butte & Ballaklava.

The January production of copper by Butte mines was 22,062,930 lb., against 22,879,116 in December. On account of a fire in one of the principal mines of the Anaconda company several properties were closed for a week, but the production of other mines of the company was increased so that there was little falling off on account of the fire, except in the North Butte mines, which are connected with the property in which the fire occurred, and they were closed for three days. The Boston & Montana properties were all down for four days during January on account of extreme cold weather which interrupted smelter operations at Great Falls.

The daily ore tonnage for the month of January, average yield of copper per ton and the average gross yield daily are as follows:

Companies.	Daily ore tonnage.	Yield per ton, lb.	Daily output, lb.
Anaconda	3,850	60	231,000
Butte & Boston	450	61	27,450
Parrot	320	60	19,200
Washoe	330	60	19,800
Trenton	380	58	22,040
Original	620	62	38,440
North Butte	900	61	54,900
Butte Coalition	1,100	68	74,800
Tuolumne	300	90	27,000
Boston & Montana	3,000	65	195,000
East Butte	380	95	36,100
Totals	11,630		745,730

Now that the fire has been subdued in the High Ore mine, all the properties in operation previous to the fire are in running order, and the work of dismantling the Mountain View is making rapid progress; it is expected that another month will witness the hoisting of ore under the new compressed-air system. After the Mountain View has been got into successful operation the work of preparing two other mines will be commenced, and by May 1 it is expected three mines will be operated under the compressed-air system. In making the changes it is being arranged that no two mines shall be closed down at the same time, so as not to interfere with the usual monthly output. Just as soon as it has been fully demonstrated that the compressed-air system is cheaper and better than that of steam, the work of extending it to all the mines will be undertaken. The coal used at the mines of the Anaconda company costs over $2,000,000 per year, and this expenditure will, of course, be done away with altogether when the compressed-air system is put into general use. The electric power for driving the air-compressors will be supplied by the Great Falls Power Co. and will bring the cost down to one-third of what it is costing the company through the employment of steam-power.

The annual meeting of the Butte-Alex Scott company is to be held at Pittsburg on February 14, when it is expected important business will come up for consideration. Since the last meeting the company has made considerable progress and the mine has become a producer. One month ago the company began shipping ore to the East Butte smelter, and the net results of the first month will not only pay all expenses, but leave a neat sum for the treasury. A suit has been filed against the Davis-Daly company for $45,000 by a man who claims that he suffered injuries of a permanent character through the fall of a cage. F. Augustus Heinze is the head of this company.

The granting of an injunction and sudden termination of the suit of the Anaconda company against the Butte & Ballaklava company came as a surprise to those who had been watching the case. The question came up on application for a permanent injunction, and the Anaconda company occupied two days in putting in evidence to show that the Butte & Ballaklava company was working on apexes in the Mountain Chief and Right Bower ground belonging to the Anaconda company. A model prepared by the plaintiff was brought into use to demonstrate the claims of the company. The engineers of the plaintiff gave evidence as to their examination of the ground in dispute, and were followed by H. V. Winchell, of Minneapolis, and John W. Finch, of Denver. Both experts stated that they had examined the ground in controversy and were familiar with the same. They declared that the vein being worked by the Ballaklava people had its apex in the Monntain Chief ground. Following Mr. Finch, the president of the Ballaklava company was called to testify by the attorney for the plaintiff. He was asked if it were not a fact that Mr. Atwater had made an examination of the working and made a report on the same. The reply was that he had no formal knowledge of any such report, but believed that Mr. Atwater had reported verbally to others. "Is it not a fact," asked Kelley, attorney for the Anaconda company, "that he did make such a report and that later it was reported to have been lost, and Mr. Atwater sent you a copy?" To this question Mr. Nelson replied that it was not. There is an interesting story in connection with this question as told by Anaconda company people to the effect that Mr. Atwater made a thorough examination of the property and afterward made a report which was not considered a favorable one, and that it was never given out. After the plaintiff announced that there was no further testimony to be introduced the defendant company stated that at this time no testimony would be introduced, admitting that a case sufficient to justify the judge in granting the injunction had been made out. This concluded the case for the present, and the judge accordingly made the order. The case will next be heard on the action of the Anaconda company to recover $750,000 from the Butte & Ballaklava company for ore alleged to have been extracted from the disputed ground. Two and possibly three months will elapse before this suit is heard.

KALGOORLIE, WESTERN AUSTRALIA

Collapse of the Bullfinch District Boom. — An Engineer's Report. — New Field of Ora Banda.—The Fuel Problem.

Australia has witnessed mining booms during the past few years, in which ore may have been found in one lease, followed, of course, by finds on others; then there were flotations in which shares soared to absurd prices, and when the truth came out, the booms burst at once. As a few instances of this sort of thing, take the Smith Creek tin, and Cloncurry copper in Queensland; Brisels Extended tin and Mt. Balfour copper in Tasmania; the Arltunga goldfield in South Australia; Mt. Maroomba lead and silver in the Northern Territory; and lastly, the Bullfinch rush in Western Australia. The only good point about these booms is that they attract numerous prospectors to the locality, so that the district is examined promptly. But the pegging out of leases, publishing reports of high value of ore, extravagant press reports, reckless company flotations, serve no good purpose in legitimate mining. The Bullfinch mine is no doubt of exceptional value, and has produced some remarkable ore, and it is to be hoped that it will continue; but it does not follow that every lease adjacent, or miles away, is of equal value. Yet this is what the press and others would have the public believe. The truth was bound to come out, and it did, with a vengeance, from the Chaffinch, a lease next the parent mine. Here was a showing with a market value of about $1,000,000. On what? On the strength of a small bunch of rich ore that was all easily put in a few bags. There were such differences of opinion between the manager, Greenway, and the director, Arthur, that the report of an outside mining engineer was demanded, and the following is the report of Mr. Grut, of Kalgoorlie: "Acting under your instructions, and after preliminary delays due to Greenway's accident, I have inspected your property in presence of Greenway's representative and Arthur. Five bags of ore deposited with bank by Greenway, stated to be taken from trench soon after Arthur obtained rich ore, assayed 20 oz. gold per ton of 2240 lb. At the time of my inspection, the trench had been deepened and widened about one foot. Arthur expressed himself confident of finding more rich ore, but after digging some time in my presence, failed to show me any gold. This trench, 30 ft. long, is situated near the northwest corner, close to the west boundary, and was designed to open a vein of quartz 6 in. wide, which, even if it carried a good class of ore, would be unimportant because it is dipping out rapidly from it. However, the highest assay of the ore is under $2 per ton. This sample was obtained within 18 in. of the spot where Arthur obtained his rich ore. This sampling was carried out in sight and approval of both parties. Shaft has been sunk 30 ft. in oxidized formation at southwest corner, but samples less than $1. The only other work of importance is a 90-ft. trench at northwest corner, and 130-ft. trench next the shaft. No ore whatever has been found elsewhere in these. Greenstone outcrops practically all over the lease. Nothing payable has been met with as yet, nor any reasonably promising lode or reef found. Very little is really known of the main geological features of the field. On account of this it is impossible at present to form any reliable judgment respecting the future prospects of your property, on which but little work has been done. I should advise systematic and careful prospecting, shaft sinking, driving, and crosscutting to prove formation. The recent absolutely unwarrantable rise in shares, it appears, was caused by injudicious publicity given to Arthur's find, followed by irresponsible journalism." The boom collapsed on this report, and the market prices fell. Grut has made enemies through his condemnation of the Chaffinch as it now stands. The Government has instructed the Detective Department to investigate, and find out who sent certain telegrams. The Bullfinch has crushed 399 tons and extracted $105,000. From No. 2 shaft, 70 tons of ore has been mined averaging $420 per ton. Stripping the lode at No. 1 shaft, west drift, 100-ft. level, ore in face samples $123 per ton. The miners on the field are all on strike for the same wage as is paid in Kalgoorlie, namely, $2.80 per 8-hour shift, in place of $2.60 which is paid in the Southern Cross district, where conditions are rougher than here. The second sale of 59 blocks at the Bullfinch townsite brought $48,000. Probably some people will regret having paid as high as $2000 to $4000 for these blocks. One block on which the owner will be granted a license, brought $15,000. It is probable that the Corinthian leases will be floated before long. Both the Mountain Queen and Transvaal mines are well opened and are ready to mill ore. The telegraph line has been extended to Bullfinch, while the water-pipe and railroad work is eleven miles out, or about half way. The field at Ora Banda, 40 miles northwest from Kalgoorlie, is attracting attention, a great deal of work has been done, considerable ore has been crushed, and mining men favor this field more than the Bullfinch district. Lack of water and crushing facilities militate against the progress there. As a whole, the Ora Banda may be described as a medium-grade field. The ore is soft, slimes a great deal, and may average $12. So far as work has been done on the sulphide ore in the Gimlet mine, it is promising. The Minister for Mines has visited the field, and promised a water-supply and other necessaries. The Government, acting probably on the suggestion of the Chamber of Mines, is to increase the geological staff by several members. The Golden Treasure lease of the Horseshoe has 8 ft. of $8 ore at 350 ft. Tributers working at 100 ft. in the Paringa mine, north of the Associated Northern, crushed 297 tons of ore assaying an average of $25 per ton, and 163 tons worth $13; all of this was the typical sulphide ore mined in this section. This mine has a shaft 1300 ft. deep, and it has been thought that it would open some of the shoots from the larger adjacent mines. Tributers have always done well on this lease.

We are threatened with another wood strike. The men want 6 cents more for cutting, and a few other small concessions. Some interesting correspondence has been published lately on the relative efficiencies of our local fuel and Newcastle coal. The evaporative power of the wood is about 3.5 to 5 lb. of water from and at 212°F., against the coal evaporating 8.5 to 13 lb. from and at 212° F. The Western Australian coal is not of great evaporative power, and will not stand much handling and exposure. It would pay to use the New South Wales coal when our firewood supplies give out, although we may also be able to get cheap oil from the Wolgan shale field in New South Wales before long. The Inspector of Forestry in Western Australia, in his annual report for the past year, states that the firewood consumed by the mines of the 'Golden Mile' of Kalgoorlie totaled 474,434 tons; this is a trifle lower than the consumption of the previous term on account of the fire at the Perseverance. The fuel was valued at $1,460,000. Domestic fuel used in Kalgoorlie amounted to 23,500 tons, and mining timber, 12,400 tons. The various electric light and power stations are supplied with wood from the district. The report further says: "The continued alienation of State forests and timber country for agricultural purposes causes some anxiety as regards the future supplies for mining timber. Firewood supplies, however, are greatly dependent on the advance of science toward obtaining a maximum of power from a minimum of fuel, as the production and use of natural oil, gas, and electricity are coming into favor and taking the place of wood."

The November gold yield was valued at $2,650,000, and dividends totaled $225,000. The Associated Northern mill is treating custom ore and concentrate from all parts. The new plant at the Horseshoe is completed, and the new stamps, Wilfley tables, 60-ft. tailing wheel, and tube-mills should soon be in operation. The new 7½ Gates breaker is at work, and the 1000-kw. low-pressure turbo-generator (A. E. G.) is running. The Perseverance mill is operating, and costs are down to $2.26 per ton, which is the lowest of all dry and wet mills, except the Ivanhoe, at which they are as low as $1.96 per ton. The Perseverance ore averaged $5.52 per ton extracted, the Rand average being $6.24, yet the former makes a profit of $18,000 on such low-grade ore, using high-wage white labor. It makes one think a little on colored labor efficiency.

NEW YORK

Copper Production. — United Metals Selling Co. — Possible Selling Agent. —New Copper Producers. — Comment on Copper Mines. —Silver Review.—Production and Demand for Tin.

The Copper Producers' Association statement places the stocks of copper on hand January 31 at 142,439,490 lb.; stocks on hand December 1, 122,030,195; increase, 20,409,293. Production, 115,696,591; domestic deliveries, 42,078,550; exports, 53,208,739.

The Guggenheim faction has successfully entered into the selling end of the metal market. One of the prizes for which the line-up of forces has been made has been the handling of the metal. It follows, therefore, that nothing could more fully illustrate the getting together of the copper people than the rumored dissolution of the United Metals Selling Company. This concern has long been known as by far the largest copper broker in the world. Its fortunes have been closely connected with those of the Amalgamated Copper Co.; it was formerly controlled by the Lewisohn Brothers, of whom Adolph Lewisohn is the surviving partner, but more recently has been under the management of Urban H. Broughton, son-in-law of the late Henry H. Rogers. Mr. Broughton has been for some years the controlling factor in Utah Consolidated. The bulk of the copper handled by the United Metals Selling Co. comes from the Amalgamated Copper Co.; formerly the selling agency owned the refinery, at Raritan, N. J., but when the Cole-Ryan interests started to build up the International Smelting & Refining Co. this plant was sold to the new concern. Mr. Broughton is evidently held responsible for the policy adopted by the United Metals Selling Co., of keeping up the price of the metal and accumulating stocks, in opposition to which the Guggenheims have kept sold well ahead, marketing copper as fast as it could be turned out, and making the price such as to induce buyers to come into the market. The manner in which the Guggenheims have prospered as selling agents has evidently not been pleasing to Mr. Broughton's associates. The latter gentleman is about to retire, it is said, from active business life and return to England to live. Following this determination, made public some little time ago, comes the rumor that not only is the United Metals Selling Co. no longer 'to hold the umbrella,' but will, in all likelihood, be liquidated and go out of business. The Amalgamated Copper Co. has been paying some $250,000 annually in commissions on copper sales, an amount which, it is conceived, could easily be saved in large part to the shareholders by the appointment of a general sales agent who could act for the various mining companies, dividing the actual marketing expense pro rata. It is thought this could be done without coming into contact with any of the statutes, State or Federal. The elimination of so important a factor as the United Metals Selling Co., if indeed such elimination is to be accomplished, points out very strikingly the economies now being enforced in the handling of copper, while the formation of a voluntary association or the appointment of a selling agent, to act for the various companies, will simply be another step toward a final consolidation. The metal market was improved materially this week by the sale of some 30,000,000 pounds, mostly for European account.

The near future will see some of the developing coppers go into the ranks of the producers. The Miami mill is to start up in about three weeks. D. C. Jackling has just returned to New York from a visit to the Ray Consolidated and the Chino, and says that the Ray mill will start up about February 20 and will be running at half capacity—4000 tons daily—by July, and at full capacity by the end of the year. The Chino plant is to handle 3000 tons daily and will be in operation in July. The Ray Consolidated product is expected to cost 9c. per pound, but Chino is to go after Nevada Consolidated's record as a maker of cheap copper. The two are expected to produce 40,000,000 lb. of copper marketable in 1911, though it will probably be late in the year before it actually reaches the market. Both properties are said to be financed up to the point of production; Ray Consolidated represents an outlay of $7,000,000; Chino, $4,500,000. Ohio Copper is to be raised out of the rut in which it has fallen if present plans materialize. The report is that Edwin Gould has agreed to take up the unsold bonds, if F. Augustus Heinze will step down and out, turning over both physical and financial management to the new interests and giving up the Mascotte Tunnel end of the Ohio Copper organization to the Denver & Rio Grande. Mr. Heinze's failure to do anything with any of the properties in which he has lately been interested, except to snarl them up in difficulties, has not added to his prestige. Just at this time Mr. Heinze is seeking new fields of endeavor and is said to have just purchased the Foster property or the Dome Extension in Porcupine, the purchase being made with funds of the Davis-Daly Copper Co. and on behalf of the Davis-Daly stockholders. There is no apex law in Ontario, so that other mine-owners in Porcupine do not necessarily consider the coming of Mr. Heinze as any particular menace. The annual meeting of the Pacific Smelting & Refining Co. was held in New York this week. Theodore Douglas, who was originally the controlling factor in the company as the head of the old Douglas Copper Co., retired from the board, and Frank H. Williams, Nelson S. Haughwout, and C. M. Vollers were elected as directors. New investors are said to have taken over the option on the unsold bonds of the Ray Central Copper Co., and to have taken up a sufficient block to insure a completion of the development work now planned. There has been no announcement as to who controls the new interests. The market in Ray Central has suffered on account of the withholding of the report known to have been made and completed by Weed & Probert. This report was to have been given out at the annual meeting, but is still being held back; which action does not tend to reassure the shareholders.

The situation in silver is reviewed by Edward Brush, vice-president of the American Smelting & Refining Co. Mr. Brush, who is considered one of the chief authorities in regard to the white metal, says: "While India remains by far the most important consumer, no silver has been purchased by the India Government during this past year for coinage purposes. It is now approximately four years since the India Government has been in the market for silver. During 1910 the total reduction of the treasury reserve, from October 1909 to May 1910, was 250,000,000 rupees. If a similar reduction takes place this year during the period of trade demand, it will leave the India Government next spring with an amount of coined rupees which would seem to demand a further coinage. It is not likely that the India Government would see its stock of coin reduced to 150,000,000 rupees without taking immediate steps to guard against a shortage." The tin market has been cornered. This week saw one or two very feverish days among the brokers and dealers in tin. Ricard & Friewall, metal brokers of London, acting for a syndicate of English and Continental capitalists, whose identity has not been revealed, have suceeded in accumulating an immense quantity of the metal in London, where there was said to be on the first of the year some 7355 tons stored in warehouse, under the control of the syndicate's representatives; with the additions made to this amount of metal since the first of the year, it is estimated that there is now in storage some $7,000,000 worth of tin. One day this week tin advanced in London £2 per ton, whereupon all purchasers on this side became panic-stricken and commenced to bid the price up, fearing further squeezes. The situation is particularly important to the tin-plate interests in this country, as our industries consume over 45% of the world's output of tin. Production in 1910 was 107,259 tons, of which the United States used 47,250 tons. More than half of the world's supply has heretofore come from the Malay Straits. The Malay mines are becoming exhausted and production has been decreased. This condition is one of the factors which has made it possible for the group of operators mentioned to achieve a position where they can make the consumer pay their own price.

General Mining News

ALASKA

The Copper River & Northwestern railway, which has been in operation for the past 18 months, has been gradually extended northerly up the Copper river, and by March it is expected to be finished as far as Kennecott, situated at the Bonanza mine. The line begins at Cordova, on Prince William Sound, and when completed to Kennecott will have a length of 200 miles. The Bonanza is noted for having vast deposits of high-grade copper ore, and these have been well developed within the last two years. It is announced that ore-shipments to the smelter at Tacoma are to begin as soon as the railroad is completed to Kennecott. During the time the railroad construction has been in progress prospecting has been active in the Copper River country, and numerous discoveries of gold-bearing ore have been made. The value of the mineral output of Alaska for 1910 is estimated at $17,400,000, divided as follows: gold, $16,360,000; copper, $740,000; other minerals, including silver, lead, and coal, amounted to $300,000. The gold production for 1910 was about $4,000,000 less than that of 1909. The principal decrease occurred in the placer mining regions.

ARIZONA

COCHISE COUNTY

The copper turned out at the Copper Queen smelting plant, at Douglas, amounts to 9,000,000 lb. per month. Of this, the Copper Queen ores yield 6,000,000 lb., the concentrate from the Moctezuma mill, at Nacozari, yields 2,000,000 lb., and 1,000,000 lb. is extracted from custom ore received from various mines in Arizona, New Mexico, and Sonora. The building of a reverberatory and roasting plant at the Copper Queen works at Douglas is making much activity there in construction. The Calumet & Arizona smelter, also situated at Douglas, turned out 4,000,000 lb. of copper in the month of January. The Centurian Arizona Mining Co. has commenced shipping ore from its copper mine at Dragoon. J. P. Richardson is in charge.

GILA COUNTY

(Special Correspondence.)—One of the churn-drills of the Miami Copper Co. was moved to the Red Spring claim, north of the centre of the company's holdings. It is intended to explore this ground as soon as possible and to hasten the work an additional crew will be put on the drill at once, thus making two shifts of twelve hours each. This hole is 1000 ft. north and 800 ft. west of the No. 4 main working shaft of the company. The other two churn-drills will be continued at exploration work in the western part of the property. In the underground workings the mine is being placed in readiness to supply the concentrator. Trolley wires have been strung in some of the main drives. The large room that has been cut 200 ft. west of No. 4 shaft on the 420-ft. level, in which will be placed the electric motors to supply the power for haulage system, has been completed and is in readiness for installation. Preparations are being made in the northwest part of the mine for handling the ore. On the 420-ft. level three drifts are being driven to the northwest, and through chutes all the ore in the level above will be sent to these drifts and transported by main haulage to the skip pocket at shaft No. 4, then hoisted and dumped automatically to the crusher bins in the concentrator. Although it was the intention to start the concentrator the first of the year, and to that end men were employed nights, so many delays have been met with it is probable that it will not begin before March 1. The non-arrival of pipe for the water-line from the pumping station to the mill has been one of the principal causes of delay. The new tramway from the concentrator on the hill to the railroad in the Miami townsite is approaching completion and should be ready in the next two weeks. Preparations are being made to build a dam across the canyon below the concentrator. This dam will form an impounding pond for the tailing from the mill. A force of men is building a wagon-road for the company from the power-house to the principal works; this road will replace the one that will be put out of service on account of the construction of the dam. Mr. Lawton, superintendent for the company, is at present in Cananea, Sonora, to complete arrangements for smelting the concentrate.

The Inspiration Copper Co. will shortly begin the installation of an electric haulage system in its mine workings. For this purpose a 100-kw. generator has been purchased and will be placed in the new power-house situated close to the Joe Bush tunnel. This generator will be of sufficient capacity to supply power for the electric motors of the lighting system and for the 75-ton experimental mill. The Colorado shaft of this company has been sunk to a depth of 635 ft., and to reach a depth to correspond with that of the station on the 500-ft. level of the Bush shaft it will be necessary to sink 25 ft. deeper. As soon as the sump and station are cut on the new level a connection will be made with the Bush shaft. At present the Inspiration company is employing four churn-drills, one of which is used in drilling on the eastern end of the property; two are used in drilling about 1000 ft. north of the Joe Bush shaft, and the other at the south end, where the drill is in ore.

MOHAVE COUNTY

Ed. Williams has opened a mine in Aquarius mountains, the ore from which is said to assay 70% tungstic acid. He has mined considerable of it and expects to make a shipment. The Frisco Mines & Power Co., operating at Union Pass, has erected a mill which is now in operation. E. H. Barton is manager, and the mill was built under his supervision.

PIMA COUNTY

The Sasco smelter of the Southern Arizona Copper Co., which had been operating on ore from the company's mines at Silverton, closed down in December. The production for 1910 was about 6,000,000 lb. of copper, as against 10,500,000 lb. for 1909. Extensive exploration by churn-drills is in progress on the company's holdings, where copper is disseminated through a porphyritic country.

PINAL COUNTY

The Ray Con. Copper Co. expects soon to have the first unit of its concentrating plant ready to operate at Hayden on the Gila river. The power plant is nearly complete, and the transmission line extending from Hayden to Ray is also nearly finished. The ore-crushing plant, situated at the mines, is likewise approaching completion. The necessary railroad ore-cars for use in transporting the crushed ore from the mines at Ray to the concentrator at Hayden are on the tracks. The reservoirs which are to hold the supply of water for the mill have been built. It is reported that work on the smelting plant has been commenced. Construction work is in charge of George O. Bradley, mechanical engineer for the company.

YAVAPAI COUNTY

The Union Development Co. is operating on two properties in Black Canyon district, close to Turkey station, on the Prescott-Crown King railroad. Sinking is in progress in two shafts, one being at a depth of 84 ft. and the other at 125 ft. Free-gold ore was found near the surface, but at greater depth the ore was sulphide. Several carloads of ore are ready to be shipped from various mines of this locality. The workings of the Hidden Treasure have been unwatered, permitting development work to begin. The mill, belonging to this property, is to be put in operation. The Jerome Tunnel Co. is to undertake the development of various properties on the United Verde lode by driving an adit 9000 ft. from a site in Verde valley, below the town of Jerome. It is estimated that it will intersect ore veins at depths ranging from 400 to 3000 ft. The plan is to have it serve for drainage and ore-haulage. The projectors figure on building a railroad from Dewey, near the Agua Fria, to the Rio Verde. This would make a direct line for ores of the Jerome district to the smelter at Humboldt. The general plan, if carried out, would obviate hoisting and pumping, and provide a market for the ore.

CALIFORNIA

CALAVERAS COUNTY

The discovery of a rich placer channel is reported at Vallicita, near Murphy's, in which nuggets and coarse placer gold were found on the Bishop claim. Ten men are employed.

INYO COUNTY

The Tecopa Con. M. Co., during 1910, shipped 9967 tons of ore to the smelter at Needles, and 8284 tons to the A. S. & R. Co. smelter at El Paso. It is stated that John B. Farish has been engaged to examine the mine and report as to its prospects and possibilities. The annual meeting of the company was held in Philadelphia on February 1. Reports from San Bernardino are to the effect that 11,840 acres have been taken up lately in the Death Valley region as claims for nitrate of potash, or saltpeter. The Villareal mine, belonging to the Domingo M. Co., situated 12 miles from Keeler, has high-grade silver-lead ore in a 30-ft. vein. Shipments of ore made to smelters in Utah, amounting to 300 tons, gave the company a net return of $42 per ton. This ore is taken from near the surface, the workings being only 46 ft. deep. The Southern Pacific Co. is to begin March 1 to change from narrow-gauge to standard-gauge the part of the railroad between

Southern California.

Owengo and Mina, which will make this a broad-gauge line from Hazen, Nevada, to Mojave, California. About 50 tons of ore daily is being treated at the 15-stamp mill of the Skidoo Mines Co. This has a gross value of about $17 per ton, and is mined from four different veins. Other mines at Skidoo consist of the Corliss, Augurbury, Valley View, King, Hoyt Bros., and Gilbert, each of which gives employment to a few miners.

KERN COUNTY

Barney Osdick, who has a 5-stamp mill in the Stringer district, near Randsburg, is to install cyaniding equipment for the purpose of leaching accumulated tailing, about 2000 tons of which is ready for treatment. His mill is to be kept in operation on ore mined in the Stringer district. He has a lease on the Gold Bug mine, which supplies part of the ore on which the mill operates, the balance being custom ore. The two shaft-houses and nearly all the equipment of the Atolia mine, at Atolia, were destroyed by fire recently. The fire is believed to have been of incendiary origin.

MARIPOSA COUNTY

The Bullion Hill mine, situated near Exchequer, in Quartzburg district, is being developed by a cross-cut, now in 300 ft., in the course of which a 30-ft. vein of ore was intersected. At this point driving on the vein was commenced, the intention being to cross-cut the vein from wall to wall at 50-ft. intervals. Along the cropping of the vein shallow shafts were sunk at regular places for a distance of 1135 ft. The vein is opened by the cross-cut at a depth of 135 ft. Work began here last September. The high-grade ore is being hauled to the railroad station at Merced Falls, and several carloads of it are to be shipped to a smelter at San Francisco this month. Assays indicate that the ore grades from $4.60 to $56 per ton. A mill is to be erected as soon as tests shall determine the method of treatment required. R. B. Binns and W. J. Stoneham are superintendent and engineer, respectively.

NEVADA COUNTY

The mill at the Central shaft, and all except 10 stamps of the North Star mill, have been closed down a few days in Grass Valley district by reason of an interruption in the supply of water. This interruption came as the result of freezing and drifting snow in the ditches at the upper ends of the flumes in Bear valley. On account of the same cause the Union Hill and Maryland mines were temporarily closed.

The Town Talk mine, situated between the Union Hill and Empire, is under option to G. V. Redmayne, who is said to be negotiating with Los Angeles and Eastern men whereby the property may be taken under bond. The Town Talk was successfully operated as a placer mine a number of years ago, but was opened to some extent later as a lode mine. There are 147 acres in the holding. It is stated that a new 20-stamp mill is to be erected at the Union Hill mine. A 10-stamp mill, formerly at Brandon, Tuolumne county, has been shipped to Grass Valley to be added to the 10-stamp mill at the Pittsburg mine.

SACRAMENTO COUNTY

This county has started injunction suits against the Placer Ditch & Mining Co., and the New Gold Run Ditch & Mining Co., charging the defendants with dumping hydraulic detritus into the north fork of American river near the town of Gold Run. A restraining order has been issued by Judge C. N. Post, prohibiting the defendants from operating by hydraulic processes during the pendency of the suit.

SHASTA COUNTY

The Balaklala Copper Co. has been operating one furnace at its Coram plant since December 28, and while the smeltermen consider that the improved Cottrell fume-controller is eliminating most of the elements that would be deleterious to vegetation, the committee of the Farmers' Association is insisting on a complete elimination of the objectionable elements as was stipulated in the decree of the court under which the plant was allowed to resume operating. Consequently, the relations between the farmers and fruit-growers on one side and the smeltermen on the other remain inharmonious.

SISKIYOU COUNTY

The Scott Bar Hydraulic Mining Co. No. 2 now owns the placer holdings of the Morrison & Carlock Gold M. Co., the Scott Bar Hydraulic Co., the C. C. Hicks & Bros., the San Jose ditch, and the mining properties of J. B. Chase, and the Mabel mine at Quartz Hill. The new company is to extend the San Jose ditch from its present terminus, near Thompson creek, to the river at a cost of $22,000. The principal stockholders in the present organization are Los Angeles and San Francisco men. Most of the properties are in the vicinity of Yreka. Dredging ground situated near Yreka, belonging to Leland and Linscott, is being tested by R. B. Cottrell with Keystone drills, and if the result be favorable a dredge will be built.

TUOLUMNE COUNTY

(Special Correspondence.)—Some work is being done on a new vein at the Dreisam, and 20 tons of ore extracted in development have been milled, the results showing $4 per ton gold. Assays of the tailing indicated from

$3.80 to $6 per ton, and hereafter the concentrate will be saved. The ore was taken from a drift at a depth of 50 ft., where the vein is from 2 to 4 ft. wide. The same vein will be tapped on the 200-ft. level in the near future. The property is being operated by James E. Conde, its owner. With five stamps and a Huntington mill, 25 tons of ore is crushed daily at the Maddox, operated under the personal direction of John Frey. The ore is taken from a shoot 4 ft. wide and yields $8.50 per ton. The system employed in the extraction of the gold is a novel one here, and is giving good results, the loss being less than 25%. Instead of clear water in the batteries, a solution of cyanide is used, the pulp and slime passing from there through an intricate system of treatment. The cyanide solution is used over and over again, being pumped back into the batteries from a receptacle into which it finds its way. A suit to quiet title to the Clio mine has been instituted by the Ora Mining Co. against the Clio Power & Milling Co. It is said the former company, which recently acquired the property, is preparing to commence operations. Driving on the 2-ft. vein from the bottom of the shaft is in progress at the Black Oak mine. It is believed that the lode is the same which made the mine famous years ago. The ore is of good grade. Ten tons of extremely high-grade ore from the rich shoot recently uncovered in the Gianelli mine, near Arastraville, will be milled at the Driesam. It is reported that the Confidence mine has been sold. A short suspension of operations at the Soulsby and other mines on the East Belt has been forced by the breaking of the Tuolumne Transmission Co.'s flume far up in the mountains.

Tuolumne, February 4.

COLORADO

CLEAR CREEK COUNTY

(Special Correspondence.)—The Sunburst, Astor, and Scepter mines, on Democrat Mt., have been taken under bond and lease by W. O. Robinson. Work has commenced and operations will be through the Scepter adit. The operator is endeavoring to open a body of zinc ore, and if the showing warrants it a mill will be constructed. The McClellan Mountain M. & M. Co. is developing the Vesper property. A streak of $70 gold-silver ore was recently opened. Another contract has been awarded by the Santiago-Montezuma M. & M. Co. to drive the drift on the Santiago vein from the Wilcox adit. The length of the drift will be 1250 ft. Several wagons and teams arrived from Denver this week to haul ore from the Santiago mine to Georgetown. It is proposed to market at least four carloads of smelting ore each week. Work is under way at the Sidney adit in East Argentine, and mining is confined to the Ontario vein. The compressor plant will be started as soon as sufficient water is available. Development has been commenced at the Rosebud, on Democrat. G. W. Teagarden, the manager, states that funds have been provided.

Georgetown, February 4.

(Special Correspondence.)—The Big Five Investment Co. has purchased from Mrs. Sarah A. Bronson the West Dove's Nest lode claim at $7500 cash. The property lies on the course of the Central adit and was a heavy producer from shaft development. Shipments are being made from the New Era mine at Freeland, average returns of $60 per ton in gold, silver, and lead being received in settlement. James Cousins is manager. The Mendick mine is again a shipper of ore. Returns of 3 oz. gold and 60 oz. silver per ton are being realized. John Owen, of Idaho Springs, is owner. The Oneida mine is classed among the heaviest shippers of the Idaho Springs district. An average of 30 tons of smelting ore is being marketed daily.

Idaho Springs, February 5.

DOLORES COUNTY

(Special Correspondence.)—The old United Rico properties of Rico are to be reorganized. Some three or four years ago United Rico was taken up by a New York Stock Exchange house and something of a manipulated market made, in which shares were forced up to $1.37 or higher. Recently stock was sold at 1c. per share. A rather elaborate reorganization plan has been submitted to the shareholders, in which the reorganizers provide for themselves nearly everything except a direct deed for the property to themselves. Stockholders' comments, so far as heard, evidently imply that they think they are to be 'strong armed' out of whatever interest they may have.

Rico, February 4.

GILPIN COUNTY

(Special Correspondence.)—A streak of solid ore containing free gold has been uncovered on the 150-ft. level of the Puzzle mine situated on Bobtail hill. The discovery was made by Ellis Vistine, a lessee. The Susan Mary mine, in Lake gulch, has been turned over to the Eastern Development Co. Operations have been commenced under direction of John Brohi. The Navajo property in Russell district has been sold by S. T. Harris to the Santiago Mines Co. Development has been started. The Howard mine has been purchased by the Cashier G. M. & R. Co. The property adjoins the Pittsburg and is situated in Russell district.

Central City, February 4.

LAKE COUNTY

Franklin Ballou, who has a lease on the Fortune mine, Little Ellen hill, is mining and shipping ore. Messrs. Butler and Hoskins, of the faculty of the Golden School of Mines, were recently in Leadville, and while there obtained 100 lb. of specimen ore from the various mines, which is to be distributed among mineralogists and universities in this country and Europe. The first carload shipment of ore was made last week from the Helena mine, on Iowa gulch. It was of good grade, and contained lead, silver, and gold. The Helena operators have had a hard problem in handling the water in the mine. It has been lowered to the 500-ft. level, on which work has been started. The Virginius, on Fryer hill, under lease to P. H. O'Brien, has been re-timbered, and mining operations have commenced. This property, previous to the letting of this lease, had been idle many years. The Garbutt shaft, Breece hill, has been equipped with an electric hoist and an air-compressor. The steam plant is now used for heating purposes. John Cortellini has charge. In the Amity mine ore is being taken out which contains an ounce of gold per ton. Formerly silver predominated in this mine, and it seems that the amount of gold is greatest in the lower levels. The Progressive shaft is being unwatered, and when the water has been lowered to the first level a pump will be installed there, and exploration work started.

SAGUACHE COUNTY

(Special Correspondence.)—A contract is about to be let for driving a 6000-ft. adit at Bonanza. It is announced that plans and specifications may be seen at the office of Dorsey & Hodges, Boston building, Denver, and the offices of Simonds & Burns, Liberty Tower building, New York City.

Denver, February 6.

TELLER COUNTY

Charles Ladd, a lessee on El Paso ground, in Cripple Creek district, has discovered a 3½-ft. vein of high-grade ore. He has a force of men mining and shipping from three to five carloads per week, the returns from which run from $45 to $90 per ton. Other lessees on the El Paso are doing well also. During January, 24 cars of ore were shipped from the Pride of Cripple Creek mine. A 5-ft. vein was opened on the 600-ft. level, the ore in which samples $18 to $25 per ton. Eight sets of lessees are at work in the Anchoria-Leland mine, all of them shipping ore, the grade of which is $12 to $22 per ton. Lessees on Block 6, in the Vindicator mine, have taken out 125 tons of ore per week for many weeks, which is reported to assay about $30 per ton. The greater part of this mine is being operated on company account. There is a large tonnage of low-grade ore on the dumps at the Ajax mine to be treated in the new mill which is to be finished in the next two months. The project of driving another drainage tunnel, 500 ft. deeper than the Roosevelt adit, is under consideration. In order that the expenses of such an undertaking may fall equitably upon all mining properties that would be benefited by such drainage, an effort will be made to secure the

enactment of drainage-district legislation, which, of course, would be applicable to all other mining regions of the State as well as to Cripple Creek district.

IDAHO

SHOSHONE COUNTY

The Federal Mining & Smelting Co. is erecting an addition to its Morning mill, at Mullan, in which 119 MacQuisten tubes are to be installed for treating the table middling, consisting of zinc and siderite, or iron carbonate, and lead. According to tests, the separation made by the tubes will result in a 50% zinc product and a lead concentrate; the siderite will come out as a tailing. The initial unit of this part of the plant is to have a capacity of 100 tons per day. The tests were made by the General Engineering Co. at Salt Lake.

MISSOURI

JASPER COUNTY

(Special Correspondence.)—The new Webb City lead smelter has started operations since the beginning of the year, making the fourth plant in the district. The smelter started with the jumbo furnace; the force of 50 men will be increased to 75 men when the slag and fume collect sufficiently to start the blast-furnace. The Old Judge mine at Oronogo, which has been operated by several companies in the past with varying success, has just been taken over by a new company. The ore here is combined with a black flint matrix which makes separation difficult and furnishes quite a milling problem. The new company is putting the large mill in order. Another company has secured a lease on the tailing pile, which contains 100,000 tons of material, and a new sludge mill has been built to treat them. Preparations have been made to reopen the Porter mine at Carthage, which has been a producer in the past, but the greatest problem has been to handle the water. Pumps have been installed and the ground will soon be so drained that work may begin. Vesuvius mine, northwest of Carthage, is to be enlarged by the addition of a rich 40-acre tract adjoining the land already worked. A 300-ton mill will be built on this property.

Joplin, February 3.

MONTANA

BROADWATER COUNTY

(Special Correspondence.)—The Keating Gold Mining Co., operating in the Radersburg district, did not sustain any serious damage to its property through the explosion of dynamite on the 200-ft. level, that caused the death of six men. Some of the timbering was damaged, but this did not interfere with the working of the mine, as the perpendicular shaft was used pending the repairs to the inclined shaft. Jesse B. Roote, a director of the company, states that shipments are being kept up and that the repairs will be made within a week or two. In October the gold averaged $17.74 per ton, November $21.20 per ton, and December $24.10. The December earnings above cost of operating were $25,000. The property is now equipped with an economical plant for the extraction of ore, and only one vein is being worked, while there is surface showing equally good on two other veins within reach of short cross-cuts. The ore consists of iron sulphide with gold.

Radersburg, February 4.

NEVADA

HUMBOLDT COUNTY

A report concerning the Seven Troughs Coalition Mines Co., for 1910, issued by L. A. Friedman, the manager, gives information as follows: There is more ore blocked out in the mine and in the bins ready for milling than at any previous time; the shoot recently followed on the 500-ft. level has a width of 3 ft.; the solidity of the formation at that depth makes it possible partly to eliminate the expense of mine timbers. There was received $2200 as royalties from lessees, and $51,715 for ore, $1380 for concentrate, $14,792 for bullion sold. Disbursements included $1612 for hauling, $4015 for supplies and construction, $5860 for milling, $29,913 for labor.

LANDER COUNTY

The Austin-Manhattan is reported as being operated successfully; the second shipment of concentrate was made recently. The process involves dry concentration and electromagnetic separation.

NYE COUNTY

The ore produced at the principal mines at Tonopah for the week ended February 4 was as follows: Tonopah, 3500 tons; Belmont, 1650; Montana-Tonopah, 1051; Tonopah Extension, 980; West End, 400; MacNamara, 50 tons, a total of 7631 tons, of an estimated value of $190,775.

Tonopah, Nevada.

WHITE PINE COUNTY

(Special Correspondence.)—For the quarter ended December 31, 1910, the Nevada Consolidated treated 592,320 tons of ore, the gross yield of which was $2,503,934.22. The cost of extraction was $399,264.06; transportation, $157,062.67; reduction, $1,285,755.95; leaving a net yield for the quarter of $661,851.54. The bullion tax for the quarter amounted to $11,913.33. This is the best showing made by the company, which, however, has not yet reached the limit of its production for its present equipment. For the past six months only six sections of the concentrating plant have been running as an average. The equipment at the smelter to provide for changing from coal to oil for fuel for the reverberatories is rapidly approaching completion, and will soon be tried on reverberatory No. 5. A trainload of oil is now on the way from San Francisco.

The first concentrate from the new plant of the Tungsten company was shipped to New York last week, and is expected to average about $500 per ton. The mill is working satisfactorily, but owing to the cold weather is running but one shift in twenty-four hours. When spring comes it will be operated on regular time, and is expected to turn out between three and four tons of concentrate per day.

The new Giroux shaft is now fully equipped. The pumps on the 1200-ft. level were started this week. The battery of eight boilers has been tried, and is working satisfactorily, and the two engines will be in operation within two weeks. Two compartments of the Giroux shaft have reached 1400-ft. depth, and work has been commenced to raise the other three compartments from the 1400 to the 1200-ft. station. A pump will then be installed at the 1400-ft. station, and a cross-cut started from that point to the Alpha workings, a distance of 700 ft. The cross-cut from the 1200-ft. level has been driven 375 ft. toward the Alpha workings, when work was discontinued owing to the heavy inflow of water. As soon as the pumps are in good working order the cross-cutting will be continued, and is expected to break through the lime into the orebodies in a short distance. Many mining engineers who have examined the equipment of the Giroux shaft pronounce it the best in the United States.

Ely, February 6.

OKLAHOMA

OTTAWA COUNTY

(Special Correspondence.)—The Midas L. & Z. Co. is a new concern working in the western part of the Miami camp. The property is turning out a carload of concentrate

per week, though the ore is being held for higher prices. Both galena and zincblende are produced, the blende being high grade. Ore is being mined on the 100 and 127-ft. levels. The Turkey Fat mine is starting new development on a lease north of mill, which will be the deepest development in that camp, the bottom of the ore face being at 335 ft. The first traces of the mineral are found at 295 ft. and a 2-compartment shaft 6 by 10 ft. is being sunk. The L. C. Church company is installing another large pump with a capacity of 2000 gal. per minute. One pump is now running day and night, and with the two pumps running steadily it is thought the entire camp can be kept drained. If this is possible, several mines and mills will resume operations, which have been shut down because of difficult water conditions. This company has completed the mill and built a tramway from one of the shafts to the mill. The Miami Amalgamated is making 12,000 lb. of lead and 10,000 lb. of zinc per day from the new drift. A large cave occurred which endangered the old workings and made it imperative to go beneath in order to get to the best grade of ore. This company has one of the largest mills in the Miami camp. Two shafts are used to hoist the dirt, one at the mill and the other to the north. The lease is known as the Sullivan tract.

Miami, February 3.

OREGON

JOSEPHINE COUNTY

(Special Correspondence.)—A recent discovery was made at the Almeda mine upon reaching the contact at the 300-ft. level from the shaft. The ore lies on the hanging wall slate and is of the character locally known as grade No. 1, being the same as that opened by levels and adits above, having gained somewhat in value, however, with the additional depth. The increase in value is mostly in copper, the gold and silver remaining about as before. Mineral occurs mostly as gray-copper and chalcopyrite, carrying gold and silver. Drifts are being driven both ways upon the ore with gratifying results, and all possible speed will be urged in reaching the vein at the 500-ft. level.

Galice, Oregon, January 23.

TENNESSEE

The Tennessee Copper Co. has reached a settlement of its smelter-fume difficulty by agreeing to cut down the roasting of ore between May 20 and September 1 to a point where all of the injurious fume can be handled by the sulphuric-acid plant.

UTAH

SALT LAKE COUNTY

The Ohio Copper Co. is drilling a well close to the settling pond, below the Lark mill, and although only 100 ft. of depth has been gained so far, the well is making plenty of water. This system of wells will afford a reserve water supply which will banish all fear of future shortages from the calculations of those in charge. No attempt is being made at the Ohio mill to force tonnage. Experience has shown, as is said, that between 1500 and 1600 tons of ore per day affords a much more satisfactory operation, a better saving of metals, and prevents wear and tear on the equipment, than were the management to crowd 1700 to 1800 tons through the plant daily. The concentrate is running from 25 to 30% copper, while the gold and silver will reach about $1.25 to $1.50 per ton of concentrate.

The Utah Metal Mining Co., having mineral holdings in Bingham and West Mountain district, is driving a drainage and transportation adit, which will be 12,000 ft. long when finished; and about half this distance has been driven. The bore is 8 by 10 ft. cross-section, equipped for electric haulage, and is to open mineral veins at a depth of 2300 ft. A connection is to be made between this and the Whitley tunnel, the latter being driven from the Bingham side. The tonnage of custom ore received by the International Smelting & Refining Co. at its Tooele plant is increasing. In addition to the ore received from the Highland Boy mine, and the concentrate from the South Utah, Beaver county, ores from ten others are being received. The December output of concentrate sent in by the South Utah amounted to 2067 tons, averaging 10.46% copper; in addition to this it contained 137 oz. gold and 2296 oz. silver. In the Ohio mill, Bingham district, a new type of crushing equipment, designed by E. A. Wall, is being installed.

CANADA

BRITISH COLUMBIA

(Special Correspondence.)—The report of the Le Roi No. 2, Ltd. covering operations at the Josie mine for December 1910, shows that 2390 tons of ore and 138 tons of concentrate were shipped. The smelter receipts were $38,324 for 2387 tons of ore, amounting to $37,539, and 98 tons of concentrate, $1785. During the same month the cost of development was $9500; ore production, $8500; and milling $1400, a total of $19,400. The drifting and cross-cutting amounted to over 460 ft. Assays obtained on the 500-ft. level showed 1 oz. 13 dwt. gold, and 3% copper for a width of 3½ ft., and 16 dwt. gold and 5% copper over a width of 4 ft. The shipments of ore from Rossland district for the week ending January 28, were as follows: Centre Star mines, 3464; Cliff mine, 120; Le Roi No. 2, Ltd., 305; Le Roi No. 2 (milled), 300; Le Roi mine, 215; Nickel Plate, 22 tons.

Rossland, February 4.

(Special Correspondence.)—The Granby company has bonded a group of mineral claims on Copper mountain near Chesaw. This deal will involve an expenditure of $100,000 if the bond is finally taken up. Diamond-drilling is to be started at once, the necessary machinery being hauled in to the group over snow roads. The shipments of blister copper from the Granby smelter for the week ended January 28, amounted to 405,000 lb. During December there was treated at this smelter 98,309 tons of ore. The copper production was 1,645,613 lb., and the value of the metallic content, $101,000. The official statement of the output for 1910 shows this to have been 20,018,048 lb. It is announced that the directors of the British Columbia Copper Co. have decided to put the stock of the company on a 10% dividend basis, payable quarterly in dividends of 2½%. The shares of the company have a par value of $5. A method of mining has been adopted at this company's big mines, intended to prevent the waste getting mixed with the ore in the glory holes and large stopes, as has been the case, to some extent, during the past two months, and which has resulted in the treatment cost being increased about 48c. per ton over what it should be. The Consolidated company will commence shipping from its Rawhide property next week. The diamond-drilling that has been in progress on the Ironclad and Fairplay claims has been stopped for the present. It is reported that the operators of the Argo development tunnel at Greenwood have opened a good vein of copper-silver ore. It is anticipated that the Hedley Gold Mining Co. will soon declare another double dividend, as the profits lately have been running close to 35%. At the Midway coal property of the Boundary Mining & Exploration Co. the engineers have decided to put in an initial plant and begin work. The work so far done has developed No. 3 vein about 500 ft. There are 6 veins on the property to be developed, which the new shaft will provide means of working. The ore shipments from the Boundary district for the week ended January 28 were as follows: Granby mines, 22,993; Jackpot, 515; Mother Lode, 6392; No. 7, 85; Rawhide, 5200; Snowshoe, 2446 tons.

Phoenix, February 4.

(Special Correspondence.)—The bond on two groups of claims on Roche de Boule mountain has been taken up by R. P. Trimble of Portland. The group comprises 11 claims at the head of Juniper creek. The purchase price was $65,000. The vein is 8 ft. wide, 4 ft. of which assays 3% copper and $3 gold and silver. The Silver Pick group on 9-Mile mountain has been bonded for $45,000. Several veins of good ore have been opened on this property.

Vancouver, February 4.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

C. W. MERRILL is in New York.

F. A. KEITH has gone to New York.

W. H. WILEY has returned from Peru.

GEORGE MACKENZIE is in San Francisco.

H. W. DUBOIS visited San Francisco this week.

C. H. MUNRO is returning to San Francisco from London.

THOMAS COX is at Coalinga for the Nevada Petroleum Company.

H. A. MCQUEEN is at Marysville, California, examining gravel property.

J. P. HUTCHINS and NORMAN STINES are in the Ural mountains, near Ekaterinburg.

CORTLANDT E. PALMER has removed his office to No. 2 Rector street, New York.

T. LANE CARTER lectured recently at the University of Chicago on 'Mining in Africa.'

THOMAS T. READ lectured this week at the University of California on 'Mining in China.'

E. B. WEBSTER has left the Red Cliff mine, Stewart, and is at Vancouver, British Columbia.

J. M. CALLOW, of Salt Lake, was at Denver and Leadville last week on professional business.

W. H. LEFFINGWELL, of Bishop, California, was at Salt Lake and Bingham, Utah, last week.

LEO VON ROSENBERG has removed his office to 11 Broadway, Bowling Green building, New York.

RICHARD ROELOFFS, manager for the Cresson Con. Co. at Cripple Creek, has gone to Chicago for a few days.

JAMES E. CHAPMAN, lately with the Amparo Mining Co. at Etzatlan, Jalisco, is spending a vacation at Soldiers Grove, Wisconsin.

WILLIAM E. FENWICK, JR., of Detroit, Michigan, recently left for Bisbee, Arizona, to take charge of the engineering work at the Bisbee Extension Mining Co.'s property.

W. H. ALDRIDGE, formerly metallurgist for the Colorado Smelting Co., at Pueblo, Colorado, and manager of the Great Falls Plant of the United States S. R. & M. Co., has been elected managing director of the Inspiration Copper Company.

THE SAN FRANCISCO SECTION of the Mining & Metallurgical Society of America met February 6 at the Palace Hotel. Messrs. S. B. Christy, E. A. Hersam, E. T. Dumble, Albert Burch, Charles Butters, F. W. Bradley, H. W. DuBois, A. C. Lawson, W. H. Aldridge, and H. F. Bain being present.

JANUARY COPPER REVIEW

By M. E. APPELBAUM

The fluctuation in the price of copper during the month of January was between 12¾ and 12¼ cents, the decline starting upon the publication of the December statistics and continuing well toward the end of the month. The European market strengthened considerably in the last few days of January, principally because of the report that the New York Central will electrify its railroad and requires for that purpose about thirty million pounds of copper. I do not agree with the pessimistic opinions being expressed as to the probable course of prices. It is quite true that at the present rate of consumption and production the surplus can be reduced but gradually; but, even if it takes a little longer, when it is accomplished the metal will be on a sound basis. It is certainly reassuring to find that such conservative men as are at the head of systems like the Union Pacific and the New York Central are ready to commit their roads to expenditures of large amounts of money, indicating, in my opinion, a trend toward better business.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

LOCATION OF MINE—MONUMENT

Under the statute of Idaho, the locator of a mining claim is required to erect a monument at the place of discovery upon which, among other things, he must place the distance claimed along the vein each way from such monument.

Flynn Groupe Mining Co. *v.* Murphy, (Idaho) 109 Pac. 851. June, 1910.

NOTICE OF LOCATION

Where a mining claim appears to have been located in good faith, it will be deemed sufficient, if by any reasonable construction the language used in the location notice describing the claim and referring to natural objects and permanent monuments imparts knowledge of its location to a subsequent locator. Under the Idaho statutes the location notice is not required to describe the exterior boundaries of the claim. Under such a notice no technicalities will be resorted to, in order to sustain a re-location of the same ground.

Flynn Groupe Mining Co. *v.* Murphy, (Idaho) 109 Pac. 852. June, 1910.

EXCESSIVE MINING LOCATION

An excessive mineral location made through mistake, where the locator was acting in good faith, renders the location void only as to the excess; but where the locator has purposely included within his exterior boundaries an exclusive area for the fraudulent purpose of holding the entire area, then it all becomes void. So if the location is made so large that it can not be deemed an innocent mistake, fraudulent conduct in the location may be presumed. And where the exterior boundaries include such an unreasonable excessive area that such boundary lines can not be said to impart notice to a prospector of a mineral location or discovery within a reasonable distance of a lawful claim, then the location will be held void on the ground that the boundaries of the claim have not been marked and established as required by law.

Nicholls *v.* Lewis & Clark Mining Co., (Idaho) 109 Pac. 845. June, 1910.

DUTY OF MINE OWNER TO KEEP MINE SAFE

In an action by a miner injured by the falling of rock from the roof of an entry to a mine, he cannot recover without alleging and proving actual or constructive notice to the mine owner of the danger, where such an action is based on the master's common-law duty to keep a safe place for his servants to work in. But where such an action is based on the duty imposed by the statute of Kansas requiring a mine owner to keep careful watch to see that rock overhead is carefully secured against falling as excavations are advanced, a miner injured by rock falling from the roof can recover without alleging and proving that the owner had actual notice that the rock was loose, or that the rock was in such condition long enough to charge the owner with constructive notice. Under the statute a miner has the right to rely on the performance by the mine owner of the duties imposed upon him by the statute to inspect and keep the roof of the entry securely proped so as to prevent such an accident, and the miner is not guilty of contributory negligence for failure to see that the rock was loose. This statute was not intended merely to declare the common-law duty, but it requires more than ordinary diligence to furnish a safe place for the miners to work. And the negligence of the foreman to perform these statutory duties imposed upon the master is the negligence of the master himself.

Little *v.* Norton Coal Co., (Kan.) 109 Pac. 768. July, 1910.

PRODUCTION OF CEMENT, LIME, CLAY PRODUCTS, STONE, AND OTHER STRUCTURAL MATERIALS, IN CANADA, IN 1909. By John McLeish. Bull. 85, Canada Department of Mines. Pp. 47. Ottawa, 1910. A statistical report.

THE PRODUCTION OF PETROLEUM IN 1909. By David T. Day. U. S. Geol. Surv. Advance chapter from Mineral Resources of the U. S., 1909. Pp. 129. Washington, 1911. A statistical presentation of oil production by States.

PROVINCES OF CHINA. Issued as a supplement to the *National Review*, Shanghai, 1910. Description of the various provinces of China, giving much valuable statistical and other information, with an account of the Government of China.

PHOSPHATES IN MONTANA. By Hoyt S. Gale. Bull. 470-A, U. S. Geol. Surv., advance chapter from Contributions to Economic Geology for 1910. Pp. 9. Washington, 1911. This includes details regarding the new field recently discovered by the Survey officials near Butte.

GEOLOGY OF THE MOUNT RADIANT SUBDIVISION OF THE WESTPORT DIVISION, NEW ZEALAND. By Ernest John H. Webb. Geol. Surv., New Zealand, Bull. 11 (New Series). Pp. 46. Maps, index. Wellington, 1910. A geological description of the copper-bearing region of the extreme northern part of the Westport division.

MINERAL RESOURCES OF ALASKA IN 1909. By A. H. Brooks and others. Bull. 442, U. S. Geol. Surv. Pp. 432. Maps and index. Washington, 1910. An interesting account of mining in various parts of Alaska, including gold placers and quartz mines, coal, tin, and other deposits of economic interest and value. Individual papers have been distributed in advance.

TRANSACTIONS OF THE MEXICAN INSTITUTE OF MINING AND METALLURGY, 1909-1910. Pp. 262. Ill. Mexico, 1910. This, the first volume of the new Institute, is replete with important papers and maps and gives assurance that the youngest of the American national associations of mining engineers has set high standards. The volume is printed partly in Spanish and partly in English. It is well edited and printed, and contains particularly interesting information regarding cyanidation.

PROCEEDINGS SYDNEY UNIVERSITY ENGINEERING SOCIETY, 1909. Pp. 191 + 8. Ill. Sydney, N. S. W., 1910. It is apparent from the papers presented in this volume that Sydney University keeps in close touch with the engineering problems of New South Wales. As is natural, coal takes first place among the minerals discussed, though irrigation, harbor improvement, and transportation problems are not neglected. F. Danvers Power treated fully the 'Coal Industry of New South Wales' in his presidential address. This was followed by an article on the 'Crushing Strength of Coal and the Strength of Mine Pillars' by Arthur Jarman, professor of mining engineering, University College, Auckland, New Zealand. In this, data derived from American tests and practice are supplemented by the results of new tests on Taupiri lignite, but on the whole the paper serves to emphasize the need of more data before mining engineers can proceed with security to plan underground workings.

Book Reviews

Any of the books noticed in this column are for sale by, or can be procured from, the MINING AND SCIENTIFIC PRESS.

THE MINERAL INDUSTRY, 1909. Edited by W. R. Ingalls. Pp. 877. *The Engineering and Mining Journal*, New York, 1910. Price $10. For sale by *Mining and Scientic Press.*

This, the eighteenth volume of the series established by R. P. Rothwell, is, we understand, the last that will be published by *The Engineering and Mining Journal.* The work will hereafter be carried on by the McGraw-Hill Book Co., and Albert H. Fay will succeed Mr. Ingalls as editor. In a way, therefore, the volume marks the close of a period. The usefulness of 'The Mineral Industry' is widely recognized. R. W. Raymond has felicitously referred to it as the 'first aid' to an engineer, and it deserves the title. As a general summary of the business of the year it forms a convenient starting point for any investigation, and the bibliographies and references in the text enable anyone quickly to find the additional details needed. Originally the volume also gave complete statistics of production in advance of those issued by the Government. The officers of the Geological Survey concerned with the 'Mineral Resources' have, however, improved their service as to promptness, and the editor of 'The Mineral Industry,' has, in a proper effort for greater accuracy, fallen farther and farther behind, until now the two publications come out at about the same time. Despite the fact that part of the reason for publication of the volume is therefore gone, it has made a name and a place for itself in other ways and is recognized to be an indispensible handbook. The present volume is no exception to the rule of high excellence set by its predecessors, and Mr. Ingalls and his associates deserve the thanks of the mining profession for their painstaking work. In passing the duties over to his successor the editor may well be conscious of having accomplished something of real value to his fellows, something for which they are properly grateful.

H. F. B.

NORTH AMERICAN INDEX FOSSILS. INVERTEBRATES. By A. W. Grabeau and H. W. Shimer. Vol 1, Protozoa, Gasteropoda, pp. 853; Vol. 2, Conularida to Echinoidea, and appendices, pp. 909. Fully illustrated. A. G. Seiler & Co, New York. For sale by *Mining and Scientific Press*, price for the two volumes, $12.75.

Paleontology has become a highly specialized science. The refinements in classification that have been made possible by newer methods of study and the large number of species known, have buried the ordinary geologist under an excess of information. No mining man has time to know the fossils, and yet he must often hazard a guess as to stratigraphy where fossils are important. Faulting of Cretaceous against Tertiary beds may be so masked as to resemble an anticline and so indicate favorable conditions for oil, and only a knowledge of paleontology can save a blunder. It is true that a little knowledge is a dangerous thing, but in this case, and there are others, a very little knowledge would be a great safeguard. To describe the index fossils so that they may be recognized without too great special study, is the task of Messrs. Grabeau and Shimer have attempted. We believe they have succeeded, quite as well as is possible at present. Successive editions of the work will doubtless permit of minor improvements, but in general the plan adopted is correct. It is not new or untried, except in its application to this field. Gray's 'Manual of Botany' and Jordan's 'Vertebrates,' both highly useful books, were built on the same plan. If the new works do as much to stimulate intelligent interest in fossils and to help the man who must work alone to unravel stratigraphy, as was done by the books mentioned, it will have justified its existence. The 'North American Index Fossils' is the only book occupying a large field and should be widely used.

AUSTRALIAN COPPER PRODUCTION

During 1910, 54,624,800 lb. of copper was produced by the Mount Morgan, Mount Lyell, Great Fitzroy, and Great Cobar, the four largest copper mines in Australia. Of this amount 17,263,680 lb. was from Mount Lyell, 15,113,280 from Mount Morgan, 14,804,320 from Great Cobar, and 7,443,520 from Great Fitzroy. December production from Great Cobar is not yet reported. Great Fitzroy commenced operations in April, having been closed down the four previous months, during which time its smelter was being enlarged.

TIN IN THE BLACK HILLS

At the tin mines at Tinton it is reported that the company has solved the problem of treating the ore, and now returns will be measured merely by mill capacity, as a vein 100 ft. wide invites mining on a big scale. At the Pa-Ha-Sa properties (formerly the Harney Peak) in the Hill City district, development and cleaning out old workings was in progress during the year. Tin ore was found in the Cowboy mine, and Gordon Duncan, who spent two months examining the property, is to make a report. In the same district E. C. Johnson was engaged in fitting up the old Harney Peak mill with machinery to treat tin ores from his Gertie property.

NEW STEAM ENGINE

A decided innovation in the way of a steam engine has been invented by John March, of Orange, California. So radical is this engine in its departure from those of the ordinary type that it is deemed of sufficient interest to entitle it to a brief description supplied by the inventor himself.

The cylinder is open at both ends, having moving cylinder-heads which are bolted to a movable steel frame outside, which is strong enough to pull the cylinder heads backward and forward. The piston-head is placed between the moving cylinder heads, thus making two chambers, one a high-pressure, the other a low-pressure chamber, the high-pressure being the smaller. The moving cylinder-heads and the piston-head have steel or metallic packing rings, so that each chamber in the cylinder is perfectly tight. Sliding valves on each side of the cylinder open and shut to receive and let out the steam with each stroke of the piston. The valves open to receive live steam into the high-pressure chamber where the steam expands between the moving cylinder-head and the piston-head. The cylinder-head moves one way and the piston-head the other. By this motion the steam escapes from the high to the low-pressure chamber, thus utilizing the steam twice in the same cylinder, the steam being equally balanced between the piston-head and the moving cylinder-head. The piston pulls the central crank on the crank-shaft and the moving cylinder-head, which is fastened to the moveable steel frame, pushes the two outside cranks at one stroke of the piston, thereby getting the greatest purchase power and full strength of the steam pressure. There are two of these cylinders on each working shaft. When one is on centre the other is at its greatest purchase power and readily brings it over this centre. By this means, all friction is removed from the shaft, making the power equal all around the shaft, for, as stated, by one stroke of the piston, it pulls and pushes at the same time. In addition to eliminating friction it also eliminates the useless strain, jar, and vibration. In the old style, the cylinder-heads are stationary and the whole thing is securely bolted to a firm foundation. The cylinder-head is not bolted, as the power is wholly on the shaft where it is needed. The inventor claims that instead of power being wasted in pulling bolts, the waste steam is used in speed and saves from one-fourth to one-third in fuel.

Mr. March has applied this type of engine to the driving of a pump for mining and other uses, and also to air compressors. In fact, the engine can be used wherever the ordinary type of steam engine can be applied.

EDITORIAL

TIN continues to attract attention among speculators. There have been large sales, and prices have dropped until half the rise of the last year has disappeared. At the same time it is by no means certain that the London syndicate has liquidated its holdings. Consumption is large and increasing, but production is also larger. As one of the leading metal houses says: "There is a corner, not a famine, in tin, and corners seldom last long."

ISSUING gold certificates against uncoined metal and a limited amount of foreign coin is proposed by the Secretary of the Treasury. To meet the demands of commerce, large amounts of coined gold are annually exported and imported. For this purpose bars are preferred, and gold certificates are rarely presented in large amounts for redemption, except to get gold for export in that form. It is estimated that the larger part of the $300,000 spent annually in coining gold might be saved by adopting the simple and business-like proposal of the Secretary.

OXYACETYLENE welding is rapidly becoming common. Because of the high temperature produced by the oxyacetylene blowpipe, and the portability of the apparatus, it is possible to accomplish results hitherto impossible. A careful series of tests made by Mr. Herbert L. Whittemore at the University of Illinois and described in *The Wisconsin Engineer* for January indicates that steel welds may be readily made in the field that could be improved only by forging and thorough fusion of material. This is particularly important in mining where isolated plants make repairs expensive both as to direct cost and loss of time. Thermit has been used to some extent, particularly on California dredges, but is not entirely satisfactory. A simple plan of direct welding without additional material will be welcomed and the work already accomplished by the oxyacetylene blowpipe in railway repair shops warrants careful study by mining men.

SEARCH for the Main Reef series of the Transvaal has been conducted in the Orange River Colony for some time by the New Rand Limited under the direction of Mr. A. R. Sawyer. The thirteenth bore-hole has reached a depth of 1660 feet from the surface, and Mr. Sawyer reports that the drill is in settled ground and passing through "good looking quartzite." This last bore-hole penetrated a small thickness of dolomite, but as it is unconformable to the Rand formation, perhaps little interest should be attached to it. Whether Mr. Sawyer will be able to find the Main Reef series

in this southern field remains to be seen. If he can establish the good-looking quartzite to be of Upper Witwatersrand age he will have gone a long way toward success as regards finding the horizon of the Main Reef series, but even then there will be the equally important question as to grade of the rock. Since so much money has been spent in pursuing this investigation, it is hoped that even should this borehole fail to intersect the Main Reef series or any definite indication of its whereabouts, it will not be discontinued until something definite, positive or negative, has been achieved.

Yard Decision and Oil Lands

In the 'Yard decision', so-called, it was held that where an association of locators took up a placer claim of 160 acres and, prior to a discovery of placer gold, conveyed all their interests to one of their associates or to a corporation, the subsequent discovery of mineral only operated to validate the location as to 20 acres; which is the maximum amount that an individual is entitled to locate in a single location. The decision does not go to the extent of holding that a conveyance of an inchoate location by an individual to another qualified individual would operate to invalidate the location, provided the grantee does make a discovery. It is decided, in effect, that prior to discovery, an individual is not entitled to hold more than 20 acres in a single claim, whether he locates the claim himself or whether he acquires it by transfer from others. The Land Department applied the same ruling to the Bakersfield Fuel Oil case involving oil lands. Its decision on this point has been recently affirmed by the Secretary of the Interior. The decision itself is generally considered to be good law, though it runs counter to long-established custom and, in the oilfields especially, works hardship. It is impossible, in most cases, to make a discovery of oil in advance of location, and it is equally impracticable in the California fields to obtain the capital necessary to make a discovery, except in the heart of proved territory, if but 20 acres will thereby be won. Prior to the application of this decision it had been customary for eight locators to transfer their holdings to one person or a corporation prior to drilling a well through which discovery was to be made. This, for many years, has been held to be sufficient for the consolidated, 160-acre 'association' claim. At the time the decision was so applied, many operators were drilling in good faith on land so located. It was impossible to re-locate the land, since, in the interval between original location and the application of the Yard decision doctrine, withdrawals had been made covering the lands in question. The practical effect was to defeat the clause placed in the withdrawal law passed last year and intended to secure the claimants operating in good faith at the time the withdrawals were made. The case was presented to Congress and the following remedial act was passed by the House of Representatives February 7:

"*Be it enacted, etc.*, That in no case shall patent be denied to or for any lands heretofore located or claimed under the mining laws of the United States containing petroleum, mineral oil, or gas solely because of any transfer or assignment thereof, or of any interest or interests therein by the original locator or locators, or any of them, to any qualified persons or person, or to a corporation, prior to discovery of oil or gas therein, but if such claim is in all other respects valid and regular, patent therefor not exceeding 160 acres in any one claim shall issue to the holder or holders thereof, as in other cases: *Provided, however*, That such lands were not at the time of entry into posession thereof covered by any withdrawal."

At the time this is written the matter has not yet come up in the Senate, though there is little reason to anticipate unfavorable action. In the House there was no opposition except from a few members who, not entirely understanding the California situation, feared a breach in the administration's conservation policy. Actually, the new law strengthens rather than weakens the force of the withdrawals, but in any event it is right and honest, since it gives to men operating in good faith what they had every reason to believe the Government guaranteed to them when they began exploration. It wipes the slate and prepares everything for a fair start.

Famine in China

East-central China is again visited by a famine, and it is reported that more than a million people must obtain outside aid until the next harvest, or perish. The cause of the periodic famines in China is not clear to anyone unfamiliar with the local conditions, but really is simple. Throughout China the level of the scale of living is so low that the people have almost no reserve, and if their means of support is cut off for even a brief period they quickly become destitute. In the great alluvial plain of east-central China the larger rivers run in channels on or above the level of the surrounding country. In time of flood they frequently break their banks and inundate the adjacent fields, often covering the country for miles in every direction. To a limited degree this is true every year, and the people make the best of it; only now and then are the floods great enough to entirely destroy the crops and bring the population to starvation level. The most severe cases result when one crop is partly or wholly destroyed and the water does not drain off in time to allow the planting of the next crop. The case then becomes hopeless, and if outside aid is not forthcoming those who can, emigrate, and the rest perish. One cent a day per head is enough to support the starving ones (eight cents per day is the standard wage for a laborer), and they must be supported until the end of May, when the first crops are ripe. Appeals for aid are being made to the outside world by many charitable and philanthropic organizations. In San Francisco the Matson Navigation Company has generously offered to receive and forward supplies to the famine sufferers free of charge. Is it worth $1.50 to you to keep a man from starving?

Speculation in Silver

That active, though quiet, speculation in silver is in progress in London, is indicated by the general course of the markets, as well as by the narrow fluctuations of silver in the Bombay market, the shipments of the metal from the United States and Mexico, and from London to India and India to China, to say nothing of the secret purchase of silver by the British Council for India. Recent reports by Samuel Montague & Company, Pixley & Abell, and other London houses, all give evidence pointing to the same conclusion. The silver product of the United States, 56,000,000 to 57,000,000 ounces per annum, is obtained no longer from the silver mines. Of the total produced in this country, over 40,000,000 ounces is won as a by-product of copper, lead, and zinc mining, copper mining yielding the largest amount. The metals, for the sake of economy, have to be separated in large metallurgical works, and it follows that the control of the silver product here has fallen into comparatively few hands. Through analogous circumstances, the market in London is controlled by a small group, which, as time goes on, tends to become smaller. In Bombay the ruling syndicate is another small group, and its members state that they are holding silver for an expected expansion of trade. Such gratuitous information may well be received with caution. According to Sir Samuel Montague, this group holds about $20,000,000 worth of silver; but this estimate does not agree with that of the native merchants, who believe that the Bombay holdings fluctuate between nothing and a much larger amount than $20,000,000. About $110,000,000 is reported in the Indian treasury, against about $130,000,000 at the same time last year; while the Indian banks hold about $12,500,000 against $27,500,000 last year; both reckoned at 1s. 4d. to the rupee. The amount held in the native States, not being definitely known, is not included in these estimates. Following are the known shipments from London during the past year to the principal silver-buying countries:

British India	$36,500,000
China	7,000,000
Germany	6,000,000
Russia	5,000,000
France	2,500,000
Total (market value)	$57,000,000

This is not equal to the market or gold value of the product of the United States and the exports from Mexico, to say nothing of silver from other countries; a fact that, together with the practice of 'earmarking' gold in the Bank of England for the purposes of the Council for India, the purchases of silver by China, and the large profit on the Government coinage of rupees in India, indicates that the known shipments from London form but a portion of the Oriental purchases and consumption. During 1910, the price of silver in Bombay varied from 11.38 pence gold per rupee weight of fine metal to 11.57 pence, most of the transactions having been made at or near the higher price. In round figures, the rupee weight of fine silver was purchased by the Government for a shilling, coined into two shillings, and made redeemable in gold at 1s. 4d.; a transaction very similar to our own coinage of silver dollars and fractions, though not quite so profitable. What profit the syndicate or syndicates made was the difference between a shilling and the cost of obtaining a rupee weight of silver from the American copper, lead, and zinc mines; something that is not easy for the producers, and impossible for the general public, to discover. Evidently, however, the profit has been considerable.

Congress and the Magazines

There has been much discussion of the postal deficit and the remedy proposed by the Administration. We have said nothing editorially regarding the matter, the *Mining and Scientific Press* being in a sense an interested party. The House has adopted a recommendation made by the Postmaster General, and it is expected that the Senate will take the same course. The bill as passed by the House chances not to affect the *Mining and Scientific Press*, but we wish none the less to record our protest. We have no desire to escape any just tax or legitimate expense; neither do we care to assume an unjust burden in order that a Postmaster General may continue to have positions with which to pay political debts incurred in rounding up Southern delegates for delivery at a National Convention. Everyone admits that the cause of the deficit is that the management of the Post Office Department is political. Even such seasoned and frank politicians as Mr. T. H. Carter and Mr. Bois Penrose, recognize the need of thorough reorganization in order to obtain a businesslike management, or even to learn exactly what the service costs, and, incidentally, they have been working to that end. It is certain that the Administration has not made out a clear case in laying the blame for the continued loss upon the magazines; and in advocating a bill that shoulders the burden upon the publications which, as a class, have criticized Congress and the Administration most severely, it opens the way to entirely fair imputations that punishment rather than revenue is the motive. The bill has all the look of dishonest legislation. No provision is made for increasing newspaper rates, for decreasing free service, or for reducing the cost of transporting the mail, nor is any other than a particular class of publications immediately affected. The law places in the hands of the postal officials the power to limit the growth of any magazine, and it does this at the same time that Congress refuses to take the Department out of politics. The danger in this is self-evident. We believe firmly in the good intentions of the President and of the majority of Congress; we are by no means certain but that postal rates should be increased; it is possible that a tax on advertising is a legitimate source of revenue; but the record as it stands has an ugly look and will require a deal of explaining.

The Balanced Life

By J. F. Kemp

*One day in the month of August last, I sat down on the summit of a high ridge in Swedish Lapland, far within the polar eirele. It is always an unusual experience for a dweller in our latitudes to look away from a commanding peak over these far northern landseapes. They are in themselves lonely in the extreme, and exeept in unusual eases, almost without visible life. The seattered eommunities of Lapps, with their herds of reindeer, or perhaps, in favorable meadowlands, a venturesome family or two of Finns, are all that can be normally expeeted. The surface is an expanse of lake and bog, with now and then a streteh of higher ground and oeeasionally a hill. The trees are stunted and gnarled by the storms and eold, and the smaller vegetation hugs the ground in a thick mat. And yet, right before my eyes, and not ten years old, was a town of 7500 inhabitants, with hotels, shops, comfortable homes, and sehool-houses, as good as anything in our latitudes, and a thousand ehildren in them, with pietures, maps, and even some well-exeeuted works of art upon the walls. I really saw a community in the making—the embryo of a little State. It made a profound impression upon me. Now, a eommunity in the making is not an altogether unaeeustomed sight to us in America. We who have been in the West have seen it often, and some of us have shared in the process. But in our latitudes the conditions usually permit the growing of those things which are good for food, or shelter, or warmth. The days are not twenty-four hours long in summer and no hours at all in winter. The frost does not come on the last of August, nor the snow in September, and remain till May or later. The water-pipes are not of necessity laid eight feet underground to prevent their freezing, nor are they bedded in non-eonduetors against the all-pervasive eold of winter. We seldom reaeh the almost irreducible minimum of which I speak. The ridge on which I sat constituted one of the largest and richest bodies of iron ore yet diseovered, and the eause of the railway and of the flourishing town was the plan to mine the ore and ship it to fill the hungry throats of furnaces in Europe and Amerieа. And when I thought of my friend of twenty years standing, who was the one who had developed it all and who was now the manager—realizing his almost impossible dreams—I could not help thinking of the position he held as the leader of this community so far from others of its kind. Seven or eight thousand people to be fed, clothed, warmed, educated, employed, and welded into a unit.

We in New York live in an old town. Customs, organizations, and form have been developing for two or three hundred years. We take them for granted. But a eommunity in the making is different. All these everyday matters must be ereated, developed, and guided. Conditions are plastie and the effeets of strong, governing personalities are all-important. If we go to live in new eommunities we then recall the rich heritage of the past, because we miss it. When we eome baek to old homes and surroundings we reeognize the large part whieh all this heritage plays in our lives.

On that summit in Lapland my thoughts ran over the ocean to our beloved university, and I could not help seeing in my mind's eye the long proeession of engineers who have gone out and who have in some cases, I well know, had the duty and responsibility of organizing similar eommunities. A mine or a manufactory is always the foster-mother of a community. It furnishes directly or indirectly all the means of sustenanee. The manager carries many responsibilities other than the mere business. Away off in Lapland, as I looked over the town of Kiruna, I could not help thinking of the importanee of giving it and every similar community an individuality, a eharacter, and a solidarity as the years pass. The life is more than meat and the body than raiment. The daily task must be performed, indeed, the daily wage must be earned, the commercial organization must be perfeeted, but after that, and beyond all that, a eommunity of feeling must be fostered, an interest of man in man must be established, a life of the spirit must be developed to hold men and families together. While we work in our laboratories, learn to construet our beams and girders, build our railways, smelt our ores, make our profits, and all that, it is not altogether with these material objeets that our graduates must deal, but with families and communities and all their varied interests. Pig iron, steel rails or beams, and profits, are not the whole story, but the welfare of men, women, and children is equally involved. This latter responsibility no manager can eseape.

Sometimes in our professional sehools we rather pride ourselves on the number of hours of lectures and laboratory work which we require, and we are apt to think that if we keep our students on the eonstant go with their tasks and keyed up to the last notch of effieiency we are giving them the best preparation for future eareers. The student, on the other hand, amid the eonstant exeitement and often somewhat feverish devotion to his own peculiar interests, believes that often he is thereby experiencing to the full his ideal of college life. But I sometimes think that on both sides we have gone too far; to the other extreme from the eloister, where in former eenturies men in the quiet retreat of an institution of learning had a ehance to think out the problems of life. The haste, the drive, the absorption, and the exeitement make impossible the reflection and quiet thought which are so essential to the best products of the mind and to the equitable adjustment of the complex relations in which so many are certain to be later plaeed. Over-much struggle and intensity destroy warmth of sympathy and depth of experienee. It would be best for us if we could oftener sit down upon some Lapland peak or its equivalent; be face to face with primitive nature on the one side, and with busy modern life upon the other; and there shape out our philosophy for the latter in the cool elear atmosphere of the former.

*A chapel address delivered to the students of Columbia University.

The Iditarod

By E. H. Thomas

Alaska's newest gold camp, the already famous Iditarod, is in a new region, so new that the first vague hints of the existence of gold began to reach the outside world less than a year ago. Unlike the Klondike, its glory did not burst meteor-like upon a startled world. Rather, its history has been similar to that of the Tanana. Rumors of unrivaled riches in a hitherto unknown region persisted, despite the contradictions and the pooh-poohs of the wise ones. The significant phenomenon of this stampede was that many went in and few came out. Of the few who returned, the majority were of the easily discouraged sort who always desert when hardships are to be faced. As a natural consequence the Iditarod got less praise than dispraise during the early spring and summer months of 1910. About the first week in June, Gen. M. P. Maus of the U. S. Army, and one Herbert L. Jaffe of Seattle reached the new camp. This is mentioned because the two men sent out such different reports. At the time they reached there the country was under a flood from the spring thaw and looked discouraging, at least to the army officer. Gen. Maus hurried on, but Jaffe remained. The General said in effect: "The country is overrun, and the people will starve. It can't produce more than $100,000 a year. The Government will have to send in aid in the fall to prevent suffering."

Mr. Jaffe said: "It sure looks good to me."

Gen. Maus' statement was given wide publicity, for it carried the weight of authority. It had no deterring effect, however, on the tide of feverish fortune seekers swarming from every direction to the common vortex, the Iditarod. The name itself was alluring. It is a fanciful corruption of the old Russian nomenclature, and by its strangeness and the remoteness of the district, it became a golden bait for all the restless horde of adventure-hungry throughout the West. Mr. Jaffe remained, for he had a commission from Robert Guggenheim to acquire everything good he could obtain. He was successful.

The figures of the United States Assay Office at Seattle show that up to November 10 the total gold taken in by that institution from the Iditarod was valued at $787,497, and on September 22, the date on which the last mail from the outside left Iditarod City, there was $150,000 left in the camp which will come out in 1911. At that time the weather was still open and mining operations going full blast, so it is certain that the first season's output will easily reach a round million. This makes it the banner camp of the North.

General View of Iditarod.

Mining on No. 1, Above Otter Creek.

Street Scene at Iditarod.

Operators and 'sourdoughs' like Frank Manley, George Riley, and others, noted the one-sidedness of the Iditarod stampede, and suspected from long experience that there must be some honey to hold so many flies, for the trails were all traveled in one direction—toward the new camp. There were only occasional returning pilgrims. Mr. Manley left his hotel at Hot Springs and his Tanana mines and joined the rush. Jaffe, the man with the Guggenheim commission, stuck. Manley, Madding, and the Guggenheims have now about all of Flat creek, and their ground is producing. Six weeks ago Manley had $200,000 and Madding $70,000. What the Guggenheim ground has yielded is a secret. Their bullion is sent direct to the Selby works on San Francisco Bay.

Iditarod river is a branch of the Innoko, itself a tributary of the lower Yukon. Because of its windings the Iditarod is quite as long as the parent stream. It is a shallow wide stream, slow running and wind-

ing in its course, and navigable for boats of the stern-wheel type. The valleys are flat and the muck and alluvial covering is shallow. Bedrock will not average as much as a dozen feet in depth, and the pay has been located on a large number of creeks. The country is lightly timbered and wood and lumber are high. The one sawmill of the camp sold lumber all summer at $175 per thousand feet. Sawdust brought $10 per load, and slabs 25 cents each. There are some horses there and wagons as well, but the mud was abominable all summer. Merchandise was scattered along the river front and the townsite was but an aggregation of tents until nearly fall. Some wooden buildings reached completion late in the summer, which relieved congestion and changed the appearance of the place materially. The country would be ideal for the poor man if it were not for the pernicious 'power of attorney' law, which is the curse of Alaska. Under it the first comers plastered the whole region with locations, and sold lays to the stampeders. These locators simply put down the stakes and then waited for the rush. Their foresight and their luck permit them to monopolize 25% of the new camp's output for an indefinite period. The land is a region of summer beauty. It blazes with color when the sun shines, and then lies buried under white desolation all winter. Its ground freezes and thaws with the seasons, unlike the Klondike, which is ice-locked the year round.

Weight and Volume of Ore

By L. S. Austin

If a cubic foot of quartz be taken and crushed to sand, its weight will be found to be, when loose, 95 lb.; when well shaken down in a box, 105 lb.; and when well packed by ramming, 112 lb. per cubic foot. The proportion of voids corresponding to these figures are accordingly 45, 36, and 32%, respectively. Natural sand consists of grains of various sizes, and weighs more per cubic foot than when sized. Accordingly a sharp sand, varying from quite large to quite small grains (a mixed product), may weigh as much as 117 lb. per cubic foot. If 100 measures of dry sand be poured into a graduated glass cylinder, and poured out again, and the cylinder filled with 60 measures of water, into this water may be sprinkled slowly the same 100 measures of sand. It will be found to fill the measure to the 94-mark, while the total bulk will reach to 121 measures, the difference being 27 measures. Subtracting, 60 – 27 leaves 33, the number of measures of voids in the 94 measures of wet sand. That is, the voids form 33% of the wet mass. If the sand be poured rapidly into the water, the result will be different, as air will be carried down with the grains. Accordingly, taking 105 lb. as the weight of dry sand well shaken down, the same mass made perfectly wet, so that the voids are completely filled, will be increased to 118 to 120 lb. per cubic foot.

These results show that the specific gravity, or weight per cubic foot, of ore may easily be less than that of the massive mineral, since it is made up of an aggregate of grains, crystals, or even pieces of massive material mingled with gangue. The whole of this may have been subjected to compression, but not to so much pressure as to eliminate the voids. Again, in the case of ores which have been altered in the zone of oxidation, the leaching out of soluble portions and the swelling due to oxidation or the absorption of carbon dioxide, both tend to decrease the specific gravity of the ore.

An article by Walter J. Meade on 'Relation of Density to the Specific Volume of Ore' appears in a monograph on the Lake Superior region by the U. S. Geological Survey. In it he presents a method for the determination of the specific volume of ore, taking into account porosity and included moisture. To do this three determinations are to be made:

(1) For the specific gravity determinations the hand specimen is thoroughly dried before weighing in air, and is thoroughly saturated before weighing in water. To ensure such complete saturation the specimen is boiled in water under reduced air pressure for a sufficient time. The specific gravity is computed by the rule 'Divide the weight in air by the loss (of weight) in water.' Thus, let the weight in air be 14.35 grams, the weight in water 10.21 grams; then the loss in weight is 4.14 grams, and the specific gravity $\frac{14.35}{4.14} = 3.46$.

(2) Porosity is expressed as the ratio of voids to the total volume. If the weight of the completely dried specimen, its specific gravity, and its weight after complete saturation with water be known, the procedure would be as follows:

Let Gm = specific gravity of the mineral
W = weight of the dried specimen in grams
M = moisture in the saturated specimen
W + M = weight of the saturated specimen in grams

Then $\frac{M}{\frac{W+M}{Gm}}$ = ratio of pore-space or voids to total volume.

Thus let the specific gravity = 4.25, the weight of the dried specimen be 8.5 grams, and, when completely saturated, 10 grams. Then we have

$\frac{1.5}{\frac{8.50+1.5}{4.25}} = 0.43$, or the voids are 43% of the whole volume.

(3) The percentage of moisture is determined by noting the loss in weight after drying at 110° C.

With the above data can be computed the weight per cubic foot as follows: Multiply the specific gravity by the percentage of solid after deducting for voids, and to the product add the percentage of water, then multiply by 62.5. Thus suppose the specific gravity is 4.5, the porosity 30%, and the moisture 10%. Then $[(4.5 \times 0.70) \times 1.10] \times 62.5 = 216.56$, equal to 9.2 cu. ft. per ton of 2000 lb. This requires the making of three determinations upon hand specimens, which may not be truly representative of the ore.

In a suit brought by the Silver King Con. Mining Co. v. the Silver King Coalition Co., both of Park

City, Utah, Chas. P. Brooks introduced a new method of obtaining, by one experiment, the weight of the ore per cubic foot as existing in the stopes. To this end he had a box prepared large enough to contain one or more pieces of ore as large as one or two men could lift. In fact, a piece as heavy as 400 lb. has been tested. Wheat is put into the box to the depth of two or three inches and upon this is bedded the piece or pieces of ore. Wheat is added and worked by hand into the cavities beneath the specimen. More wheat is added until the box is full, and then it is jarred down compactly by raising the ends of the box a little and letting it fall, also by revolving the box slightly. The wheat is roughly struck off with a straight edge and jarred again, then smoothly struck to a perfectly even upper surface. Another box is set close to the first and into this part of the wheat is transferred by hand. The ore pieces are next taken out, brushed to free from any grains of wheat, then weighed. Meanwhile the wheat is returned to the first box and is carefully leveled, using a straight edge short enough to be worked within the box, and is jarred to pack it as solidly as before. With care a perfectly level upper surface is obtained, and by measuring downward from the top, the space within the box, which had been occupied by the pieces, is obtained, and the volume calculated. From the weight of the specimens and their volume is determined the actual specific gravity, and consequently the number of cubic feet per ton. This method has the advantage that large pieces can be tested rather than the small selected specimens so generally used for specific gravity determinations; also no calculations are needed other than of the volume left after removal of the pieces or specimens from the box.

In the suit alluded to above, the lead ore from the Silver King mine was classified into first-class or shipping ore and second-class or milling ore. The first-class ore, as estimated by the Brooks method, was 8.96 cu. ft., and the second-class, 14.4 cu. ft. per ton, and as taken from the stopes, was in the ratio of 1 ton of shipping ore to 5 tons of milling ore. The assay-value of the shipping ore of the above specific gravity may be thus given: Pb 55.6%, Fe 3.10, S 3.16, with Au 0.16 oz. and Ag 38 per ton. The second-class ore would assay, Pb 15.8%, Fe 10.3, with Au 0.06 oz. and Ag 13 oz. per ton. Determinations of the number of cubic feet per ton as made by the different witnesses varied largely. Thus, by computing the weight of the ore from the specific gravity of its constituents, J. E. Talmage found 5.55 against 8.19 cu. ft. by the Brooks method. On cross-examination he altered this to 7.2 cu. ft. per ton. Afterward, with the assistance of Mr. Ebaugh, he found 6.17 cu. ft. per ton. Later, the matter was turned over to a joint committee of four persons, including the two just named, who by a modified method found 7.43 cu. ft. per ton. Any method that does not take account of the porosity of the ore and of the moisture subsequently absorbed, will give incorrect figures. The experiences cited show how difficult it is to obtain accurate results.

The Colorado-Toledo Mill

By W. B. Le Wald

The Colorado-Toledo Mining Co., which is developing mines on Collier mountain in Summit county, Colorado, is completing a mill that is to be put in operation early in March. The ores to be milled consist of mixed sulphides containing lead, zinc, gold, and silver. Mining is done by means of an adit, now driven 3000 ft. into the mountain and tapping veins at 1000 to 2200 ft. in depth. About 1200 ft. of driving has been done on the various veins, and the adit is still to be extended 1400 ft. to intersect additional veins. The scheme of treatment is given below.

After weighing on scales the ore from the mine is delivered in cars to two bins of a total capacity of 135 tons, situated outside the mill, and so placed that they may receive the mine ore and store it when the crusher is idle. From these bins the ore is fed to a No. 5 Austin gyratory crusher. This is

Colorado-Toledo Mill, Montezuma, Colorado.

of large capacity, and is designed to crush enough ore in 8 or 10 hours to supply the mill for 24. One man on an 8 or 10-hr. shift will therefore crush all the ore, thus doing away with labor in the crushing department for the remainder of the 24 hr. From the crusher the ore is delivered automatically to a belt-elevator with 14 by 6-in. buckets running at about 400 ft. per minute, and is elevated to a revolving screen or trommel fitted with a No. 7 wire screen with 1¼-in. openings. The undersize from this screen (1¼ in. or about 26 mm. and finer) is automatically sampled and sent to the mill-bins. These have a total capacity of 270 tons. The oversize from the screen will be returned to the crusher. It is a question whether by returning the oversize to the crusher the ore will be broken fine enough, but it is thought that with a 'choke' feed it will. If so, there will be the saving of a small crusher for the re-crushing of this oversize. The crushing department is operated by a 35-hp. motor, and is entirely separate and distinct from the main mill.

From the mill-bins the ore is fed by automatic plunger feeders to a 20-in. belt-conveyor which de-

livers it to a bucket elevator, with 18 by 6-in. buckets running at 400 ft. per minute. This elevator delivers to the revolving-screen line which consists of five trommels, three 6 ft. long by 3 ft. diam., and two 9 ft. long by 3 ft. diam. The short ones are for the coarser sizes, and the longer ones for the fine sizes. The wire used will be as follows:

Mesh.	No. Wire.	Opening, mm.
2½	13	8
3	10	5
4	11	3¼
6	13	2
12	18	1

The oversize from the 8-mm. trommel will be sent to coarse rolls, re-ground to 8-mm. size, and returned to the trommel. The 8 to 5-mm. size will be delivered to No. 2 jigs, the 5 to 3¼-mm. size to No. 3 jigs, and the 2 to 1-mm. size to No. 4 jigs. The ore 1-mm. and finer goes to a 4-compartment hydraulic classifier where the No. 1 spigot delivers to No. 5 jigs. Spigots No. 2, 3, 4, and the overflow, go to Card tables. The No. 1 jig is two-compartment, treating 8 to 5-mm. size, and will collect clean galena on the first compartment and impure galena on the second. The tailing will be sent to the No. 2 or fine rolls for re-grinding. The re-ground product is to be returned by the elevator to the trommel line. The No. 2 jig is also two-compartment, treating 5 to 3¼-mm. size. Its products are the same as No. 1 jig and the tailing is treated in the same way. The No. 3 jigs are four-compartment, treating 4¼ to 2-mm. size, and will make clean galena on the first compartment, galena and iron on the second, iron-zinc middling on the third, and zinc on the fourth. The tailing goes to the fine or No. 2 rolls, as in No. 1 and No. 2 jigs. The No. 4 jigs are four-compartment, treating 2 to 1-mm. size, and making similar products to the No. 3 jigs, and tailing going to the tailing launder. The No. 5 jigs are four-compartment, treating the discharge from the first spigot of the hydraulic classifier, the product and tailing being similar to that from the No. 4 jigs.

Of the above-mentioned jig products, the galena and the galena-iron will be a concentrate for shipment to the smelter. The iron-zinc middling is reground for further treatment. The zinc may or may not be marketable, depending on ore conditions, and how perfectly it can be separated from the other constituents. The bed-screens on the jigs will be as follows: On No. 1 and 2, 4-mesh, No. 11 wire, giving a 3¼-mm. opening; on the No. 3 and 4, 6-mesh, No. 13 wire, giving a 12-mm. opening. The same wire will be used on the No. 5, but this jig will be bedded with concentrate from the No. 3 jig. Space has been reserved so that if it prove necessary, machinery can be set for re-grinding and treating separately the zinc middling. As now arranged, the middling goes to the hydraulic classifiers, and the first spigot product is sent to the No. 5 jig. The No. 2 spigot is delivered to coarse-concentrating tables, the No. 3 spigot to other tables for medium-size, and No. 4 spigot to fine tables. All these tables will make a galena-iron and iron-zinc middling, a zinc product, and a tailing. The products will be similar to the ones made on the jigs, and be mixed with them for shipment or other disposition.

Arrangements have been made to dewater all jig tailing and concentrate, excess water from the tables being settled in large tanks and the clear water decanted and sent to waste. The thickened settling is to be delivered to a Card slimer, which will make the same products as the other tables. All concentrate will be delivered to bins by gravity. Provision is made for automatically sampling the tailing or waste from the mill, and all concentrate. The mill is heated, and driers for concentrate provided. Water for mill operation is distributed from an 8500-gal. tank, fed by a 6-in. pipe, and a fire-line, separate from the operating line, and with full main pressure, has been provided. It is expected to operate the mill with two men on a shift, with the addition of a crusherman for the 8 or 10-hr. shift.

NATURAL GAS IN 1909 AND 1910

The production of natural gas in the United States in 1909, as ascertained by a joint canvass made by the U. S. Geological Survey and the Bureau of the Census, is estimated by B. Hill, in charge of this work, under the supervision of D. T. Day, to have been $55,000,000, an increase of only about $359,626 over that of 1908. There were no great changes in the industry during the year, the production continuing to decline in Kansas, and an increase being made in Oklahoma and in the Caddo field in Louisiana and in Texas. An interesting feature was the supplying of Fort Worth and Dallas from the gasfields of Clay county, Texas. For the year 1910 the total production is estimated at $57,000,000, an increase of about $2,000,000 over 1909. During 1910 a feature of great interest was the development of what promises to be a very large supply of natural gas in the Buena Vista hills, Kern county, California, east of the Sunset-McKittrick oilfield. Arrangements were made and practically completed during the year for piping this gas to Bakersfield and other towns in San Joaquin valley.

SMELTING BY ELECTRICITY

In speaking of the work of the Electro-Metallurgical Commission, Professor Farnps, of the University of Christiania, one of the members, says: "It is quite possible, in electric smelting of iron ore, to compete with smelting of the old type in other countries. The iron ore is no more expensive here than in other places, and Norway is richer in electric energy, and electric power here is much cheaper than in other countries. Should the electric smelting of iron and steel, in spite of all this, become more expensive than smelting by the old methods, it will still be able to compete with the old method of smelting because of the much finer quality of the product. In Sweden, where the new electric smelting furnaces have been installed, the results show that the new method is a success."

Cripple Creek Metallurgy

By Thomas T. Read

The progress made toward solving the problem of how best to treat the rather difficult ores of the Cripple Creek district is perhaps more striking to one re-visiting the camp after four years absence than to those who have watched its daily growth. In any case the problem of ore-treatment at Cripple Creek posseses so much interest that no excuse is required for adding to its discussion.

The unoxidized ore at Cripple Creek consists essentially of tellurides of gold in a gangue of which the most significant feature, is its high aluminum content. These give us the governing conditions; the gold can not be recovered by amalgamation or cyanidation in the raw state, the ore can not profitably be concentrated because of the brittleness of the gold mineral, and can not be smelted except when mixed with a large quantity of easier-smelting ore. Roasting is expensive, and produces small lumps of metallic gold that are difficult to catch by amalgamation and impossible to dissolve in cyanide solution in any reasonable length of time. Some years ago the problem had been brought to this stage of adjustment; the rich ores were sacked and sent to the smelters at Pueblo, Denver, and Salida (where some five years ago the smeltermen found that Cripple Creek ore could be used to advantage to replace the lime formerly used in the pot-roasting of lead ores to keep the charge from fusing in the pots). Only the richer ores can be treated thus, as the treatment and freight charges become too severe a tax on the lower-grade material. That of medium grade was sent to mills at Colorado City where it was first roasted and then chlorinated. The low-grade ore was left in the stopes or piled on the dumps.

Meanwhile Cripple Creek was fast approaching that stage in the development of every mining camp where the former medium-grade ore becomes high-grade and the former waste is regarded as low-grade ore, the change being due both to the exhaustion of the richer ore and the lowering of the working costs. From time to time mills were started adjacent to the mines with the intention of treating lower-grade unoxidized material than could be shipped to Colorado City. These were generally unsuccessful, for a variety of causes.

About four years ago the opinion had become general that the chlorination process, preceded by roasting, was unsatisfactory because of the high gold content of the tailing and the high cost of treatment. Two improvements were made; the chlorination process was supplemented by concentration and by cyaniding the tailing; and a new process of roasting, re-grinding, running over blanket strakes to catch the free gold, followed by cyanidation of the ore.

In the face of the decreasing grade of the average ore, the items of $1 for freight to Colorado City and $0.70 (about) for roasting became painfully significant. It was clear that some method must be found of treating the ore near the mines, without roasting.

The problem of treating the unoxidized ore without roasting hinges on the fact that the gold telluride is not soluble in ordinary cyanide solution. It can be made to dissolve by using a solution that has great oxidizing power. One of the first methods tried was bromo-cyanidation. There have been no published accounts of the detailed results of experiment on these ores, but the impression is general that bromo-cyanidation fell before the crushing blow of high working costs, coinciding in a general way with Western Australian experience in this regard. It is not dead, however, as it is used in certain instances to supplement the main method of treatment, and I regard it as not improbable that with further experiment bromo-cyaniding may be found useful in many cases. The fact that the whole history of the cyanide process has been a constant struggle to perfect the mechanical equipment used must never be lost sight of in considering the merits of any proposed process.

A significant feature of progress in the past year has been the introduction of the Clancy process for treating unroasted ore. Its essential features are the use of cyanamide and iodide in the solution and the use of the electric current for producing a high degree of oxidation without excessive consumption of cyanide. The impression among the best informed is that the process obtains the desired extraction, though no actual working costs have been made public. A great deal of the discussion of this process has been footless and entirely beside the point. Metallurgy is chemistry applied to business, and if by treating gold ore with a solution of old boots a good extraction at a low cost of operation can be obtained, it is good metallurgy: and if by treating with C. P. chemicals in apparatus of the latest refinement of design the extraction is poor and the cost high, it is poor metallurgy. When the Clancy process demonstrates low costs of operation its position will be impregnable.

The present stage of development in treating the raw ore is to first crush in cyanide solution and classify the product into sand and slime, using either the Dorr or Aiken classifier. The sand is concentrated on some approved type of table, the tailing rejected and the concentrate sent with the medium or high-grade ore to Colorado City or Pueblo. The slime is treated by some process that will give the necessary oxidation. The most important mills are not yet ready to present their processes for criticism and comparison, but by the end of another year it is hoped that a more detailed discussion of progress can be made.

Meanwhile we have the brutal fact to face that the shipping ore from Cripple Creek is steadily decreasing in grade. This is partly offset by the fact that the constant pressure on the Colorado smelters to obtain silicious ores to smelt with the flood of basic ores produced in most of the Colorado camps makes them more willing to take Cripple Creek ore at a low treatment charge, even though it is aluminous rather than silicious.

Petroleum Mining, a New Branch of Engineering

By Raymond S. Blatchley

Specialization has become a potent factor in modern progress, particularly in construction work and in the development of great enterprises. Upon civil, mechanical, electrical, mining, and chemical engineers has fallen the burden of developing great industries and harnessing the forces of nature. These specialists are being turned out annually by hundreds. Great railroad problems are being solved upon a methodical basis, new machinery is being developed to minimize human toil and produce added power, new resources of mineral wealth are being unearthed and converted into value, and new industries with cheaper methods are being developed by the delving into latent mysteries of chemistry. Great results have followed the efforts of the engineers, and America has secured a world-wide reputation for energy and progressiveness. The future holds even greater promise of the advance of the nation along these same lines, in unexplored fields, for in many enterprises there has been scarcely any specialization. In the latter class falls the petroleum industry. This, though but 50 years old, has contributed a notable chapter to the world's commercial history, and particularly to that of America. It has assumed gigantic proportions in recent years. The use of various oils, gasoline, and by-products from petroleum is universal and essential to modern progress, creating a continuous demand for crude oil that will always be in excess of supply. Of the many branches of the industry, perhaps the most advanced is that of the manufacturing side. Chemists and physicists have made wonderful advance in creating new by-products, and especially in the utilization of waste materials. The future of this department of the industry is one of great opportunity to trained men, especially to chemists, for as yet the chemistry of petroleum is little known. It varies widely for oils of different fields. A second and vital branch of the industry is that of production. This offers greater opportunity to the trained man in that there has been little or no specialization, and there is need of trained engineers. The present day does not warrant any worry over the lack of production, yet the inevitable decline of all of our present fields suggests a care for the future. In some near day, production will need a new stimulus, and it seems that the proper way to create this is to develop a type of man peculiarly fitted to work out the problems of oil accumulation and to solve the many varied questions pertaining to its production.

The men who have developed the vast oil-producing areas of today have done the frontier work of a great industry. They are the pioneers, who, through pure grit, costly practical experience, and the intense lure of the game, have made possible the present industry. Their patient toil and indifference to loss is significant of American success, yet however profitable their operations may have been, it is easy to see that had they had a better knowledge of geological conditions, in many instances their losses would have been greatly minimized. The development of new fields, in practically all cases, dates back to wild-cat discovery and to the gradual 'feeling out' of pool limits. Often drilling was stimulated by oil seepage, either in outcrops or in faulted formations. Outside of these influences but little work scientifically has been done until within recent years. Lately Government and State geologists have contributed to the development and a gradual belief is arising that they are of service to the oil-men. Properly trained men are few in proportion to the enormous field. They are, for the most part, men trained in geological problems and are able to handle only certain phases of the development. They are not, as a rule, trained petroleum engineers, because these are scarcely known in America, but they are rather geologists. Whatever benefit they have been able to render to the oil-producing business is along geological lines. Their work has been practically limited to the vicinity of newly proved areas, though the results accruing from the investigation of various fields is of immense value toward a broader interpretation of the work of the future petroleum engineer, especially in his search for new areas. The questions now arise, is it possible to develop engineers who can carry on work that will build up the producing side of the oil industry and put it on a scientific basis, as in other types of mining? Is it possible to go into new territory and be able to outline oil areas? The answer to the first question I believe to be "yes," and the method toward this end is to educate men along the lines of the petroleum business and at the same time bring them in touch with the chemical, physical, geological, mechanical, and economic possibilities of the industry. The answer to the second question is, strictly speaking, "no," yet possibly something is here possible. The possibility lies in a close study of outcrops, water-saturation, dips, and of stratigraphy—the latter meaning the sequence of formations—and the construction of structural diagrams showing the position of anticlinals, synclinals, terraces, and domes. The engineers, through the determination of rock structure and water conditions, may be reasonably assured of a working basis and may eliminate a good portion of the gambling element from the business. They may direct drilling to the best favorable condition for the accumulation of oil and gas. Accompanying this phase of the work, as the advance is made into new territory, there arise problems of transportation, engineering, fuel-supply, and other intricate matters that can only be handled by the trained engineer.

Are there new fields still to be opened? As for this question, it is sufficient to say that there undoubtedly exist many untapped fields in the United States, Canada, and Mexico. The fact that most of the fields of the world have been limited to the sedimentary rocks, and that these are generally prevalent over the earth's crust, is an answer in itself.

So far the discussion has been limited to the field

for specially trained engineers. More systematic development of oilfields may be accomplished by including the operators and drillers themselves in a scheme of special training. The majority of the several hundred thousand persons connected with the oil and gas business in America are young men. Few have received any education that is of special benefit in their occupation. Why not educate the future generations with some of the technical training of petroleum engineers and thus provide them with better understanding of the scientific character of the oil business? At the same time that they are securing this they may receive the usual academic education and thus be equipped for the business of their choice. It is my opinion that the industry is ready for such action. Whether such a plan would have the favor of the oil-men is uncertain, since but little consideration has been given the subject.

Petroleum mining is a branch of engineering. The term is as yet unfamiliar to the American oil industry, since it is more particularly a foreign expression, meaning in its strictest sense the development of oil properties and the winning of petroleum. The exploration for petroleum is essentially mining, and it seems to fit no other classification. It is different from ordinary mining, however, in that it involves the laws applying to liquids rather than to those of solids. Moreover, the distribution and accumulation of petroleum is dependent on stratigraphic and structural features that do not apply directly to other minerals. Petroleum, accompanied usually by gas and salt water, is, to a certain extent, migratory and offers unsolved problems not found in any other type of mining. The underground manipulation in winning petroleum calls for peculiar machinery unlike that of ordinary mining, and thus introduces special mechanical problems. Petroleum mining is closely related to the other branches of engineering and scientific work, such as civil and mechanical engineering, physics, chemistry, and geology, and necessarily borrows from them for the development of the engineer. In fact, there is occasion for specialization within the subject of petroleum mining, and the development of petroleum mechanical engineers and petroleum chemical engineers will become necessary. The possibilities to be gained under each subject are treated individually below. Civil engineering offers training in construction work of various kinds. The surveying and laying of pipe-lines within the oilfields and from them to distant refineries requires accurate leveling, especially if extensive gravity systems are to be employed similar to those of the Illinois fields. California fields require work in the construction and maintenance of wagon-roads and in foreign fields light railways are built. Overland pipe-lines and light railways require rights-of-way. Oil areas often lie close to large bodies of water, and docks or piers are needed. The design and erection of power-plants, field buildings, storage tanks, loading racks, and pumping stations require training in civil engineering. This training is also needed in order to determine well elevations for purposes of geological and structural study. Only in this way can one determine the dip and rise of various formations, and the approximate limits of new and old areas. The oil business has developed certain types of machinery that are peculiar to its needs, and the possible development of additional useful tools and various mechanical devices opens up fields of wide opportunity to young men of an inventive turn of mind. Mechanical engineering offers a wide technical understanding of arrangement and use of machinery and the incorporation of phases of this work in petroleum mining is desirable. The design and manufacture of special drilling tools for penetrating great depths of peculiar formations and for surmounting the many difficulties that overtake the driller is an important subject, both for present knowledge and future investigation. The design of pumps for transporting viscous liquids without blockade of movement is important. The arrangement of power-plants and pumping stations, the making, setting, repairing, and recovering of casing; the manufacture, assembling, and use of steam boilers, steam-economizing devices, steam, oil, and gas engines; the knowledge of steam, gas, and electric power; methods of excluding water by means of casing, packers, and use of cement; methods of sand-pumping, boiling, and devices for inducing flow of oil, gas, or water; and many other detailed forms of mechanical need are useful, if not necessary, to the study of petroleum mining. Special opportunity is open to the petroleum mechanical engineer today in the use of various oil-burners and oil-fuel apparatus in marine, railroad, and domestic application, especially since recent experiment has shown the practicability of oil as a source of cheap and efficient power. The condensing of portions of natural gas into gasoline and other similar volatile liquids at the gas-well without the loss of the gas, is commanding present attention. Many other possibilities might be mentioned, but the above are sufficient to show the need of specialists and also of general knowledge on the part of the petroleum engineer.

The study of physics provides training to the petroleum engineer in various simple and everyday problems. The inequalities of temperature and the effect upon pipe-lines, machinery, and even the product itself, is a subject of interest. The mechanics and laws of liquids, evaporation, congealing, pressure, equilibrium, weight, and motion, form the basis of mechanical engineering in its relation to petroleum mining. The chemistry of petroleum is slightly known today except from its industrial side. It is a subject that has the earnest consideration of Government officials, and their efforts will pave the way to a wider investigation. The possibilities for additional successful research are exceedingly promising. Aside from the scientific gain through research, new methods of analysis, fuel possibilities, new methods of distillation and refining, new by-products, and more complete utilization of waste products, are open to investigation. An intimate study of the petroleum itself is needed. The problem of its origin is as yet not definitely solved, and new facts concerning its composition and organic relations may

be of considerable aid in establishing correct theories of its origin. The science of geology is one of the greatest aids toward the development of petroleum. In event that the petroleum engineer be called upon to do the bulk of outlining new fields, he will need a knowledge of the rocks of the area to be investigated. An understanding of stratigraphy and geologic structure is indispensable. Some knowledge of paleontology will be necessary to aid him to determine the character and classification of the oil formations. The study of the dip relations of outcrops will materially assist him in his structure determinations. The principles of geology will aid the operators, drillers, and other men connected with the business,

The economics of petroleum would offer a valuable addition to the education of the petroleum engineer. The subject involves the discussion of necessary steps to successful handling of oil properties. Phases of leasing, choosing well-sites, contracts for drilling, shooting of wells, taking the oil, power, and property equipment, costs of operating leases, oil investments, buying properties, gauging properties, geographical studies of distribution of oil and its transportation, storing the oil, keeping of records or samples of wells, statistics, legal phases of the business, are all worthy of study. All this suggests the need of special training for the petroleum engineer. The list of needs is long, yet by selection a good sound training can be got that will greatly aid the industry. Such training is not given, at the present writing, in any university in the world, though several foreign schools are considering the establishment of such a course and at least one American university has the plan in mind.

STAMP-DUTY ON THE RAND

Transvaal statistics for 1910 show that while a greater tonnage was treated than in 1909, the average number of stamps dropping on the Rand is 155 less than a year ago. Tube-mills have increased 44 in number. Average mill duty per stamp per day has increased from 6.86 to 7.42 tons, while the percentage sorted out at the surface has remained exactly the same, namely, 13.6%. The Roodepoort United new mill has outclassed all the others by crushing 19 tons per day, Knights Central coming next with 9.92 tons, and the new Bantjes mill 9.9 tons. The gold yield was a penny better per ton than in 1909, but costs have gone up from 16s. 11d. to 18s., so that the gold mines are actually making 1s. per ton less profit than they did a year ago. The three mines worked most cheaply are Knights Deep, 11s. 3d.; Simmer & Jack, 12s. 4d.; and Witwatersrand, 12s. 8d.; all blessed with thick reefs and big mills. Estimating the returns for December, the following probable final returns for the year 1910 may be calculated: tonnage milled, 21,400,000; gold won, £30,650,000; profits, £11,200,000; dividends, £8,875,000. In 1910 the distributed profit per ton milled was 8s. 3d., as compared with 9s. in 1909, while out of every £1 won the shareholders received 70d. in 1910, as against 75d. in the previous year.

Ore in Sight

By C. S. Herzig

The estimation of ore in sight, either in the valuation of a mining property for purposes of sale or purchase, or during the course of mining operations for the purpose of information to the stockholders of a company, is a subject which has been widely discussed in various technical publications at different times. Engineers are all, more or less, familiar with the efforts made to standardize the terms employed to express the relative importance of the ore reserves in a mine depending upon the certainty with which particular blocks of ground may be expected to yield the results stated. Perhaps the most generally accepted set of expressions is that advocated by the Institution of Mining & Metallurgy of London and referred to as 'positive ore,' 'probable ore,' and 'possible ore,' but whatever nomenclature may be affected by any particular engineer, the object to be served is the same and the impression that is intended to be conveyed remains the same: consequently, the more simple and older expression of 'ore in sight' or 'ore reserves' continues in favor among most engineers.

The establishment of the value of certain blocks of ground must depend, under ordinary circumstances, upon the actual exposure of this material on three or more sides. Only in cases where the geological characteristics of an orebody are firmly established by careful investigation or by experience of the distribution of the valuable metals in the ore, can estimates of tonnage and value be prognosticated with any certainty when a block of ground is not opened on three sides.

Sampling of ore exposures under ordinary circumstances is a purely mechanical operation calling for but a small amount of experience and judgment on the part of the sampler, so that such work may be, and usually is, entrusted to younger men. The interpretation of the sampling results, with a view to determining the future possibilities of an orebody, is one that calls for, not only a large fund of experience, but also a factor not ordinarily taken into consideration, namely, the natural aptitude of the engineer for this class of work. There are many cases where an estimate of the ore reserves in a mine can be made with accuracy by one who has never visited the property, simply from assay plans. On the other hand, there are instances, by no means few, calling for a higher skill in the interpretation of sampling results and where the actual assay returns can not be taken as an absolute gauge of the possibilities of a property. Instances of this character would refer to ore deposits where the values are erratic, due to the irregular occurrence of high-grade bunches, streaks, or seams in a larger mass of lower-grade material. In cases of this sort, sampling by the ordinary methods may show results of such a character as to indicate no profit. This comes from the fact that during development operations when the high-grade spots are found, they are usually mined out, as the raisins can be picked

out of a pudding, leaving only indentations to mark the spots where they occurred. In deposits like these, it becomes necessary to make a detailed and minute geological investigation of the mode of ore occurrence and to predicate the conclusions largely on the result of such investigation instead of altogether relying on the result of the samples taken at regular intervals in the mine workings.

Recently I had an opportunity of visiting a gold mine in Nevada that had been examined by a well known engineer, a man who is prominent among the copper engineers of the country, and the result of this engineer's sampling of the mine in question, according to information given by the management, showed the ore to be of an unprofitable grade. The faces exposed, at the time of this engineer's visit, were the drifts and various other development openings, besides a number of old lessees' stopes from which high-grade ore had been mined. These old stopes represented the raisins in the pudding. Despite the unfavorable report of the engineer in question, the operation of the mine has continued, a mill has been erected, and profits have been regularly accumulating month by month. Other mines in Nevada present a similar state of affairs, and for their successful and intelligent operation, require careful and continuous hand sampling in order to obtain the best results. This, unfortunately, is a practice which does not seem to obtain to any great extent in that State. The mine managers consider hand-sampling underground an unnecessary expense.

A mine of considerable importance has recently become the subject of a great deal of unfavorable comment due to the repudiation by the manager in his annual report to the company of his quarterly estimates of ore reserves. This is one of the most startling illustrations of the calamity which may befall any company, due to a lack of the proper data necessary to enable the accurate estimation at all times of the ore reserves in the mine. A case of difference of opinion among engineers, still fresh in the minds of the mining community, is the great variance in the estimates of ore reserves made by two sets of well known and competent engineers on the Utah Consolidated. That there may be an honest difference of opinion as to what constitutes ore in sight by different engineers, is easily conceivable, and may be admitted without cavil. Many engineers are so ultra-conservative as not to figure any ore as being in the reserves, unless it is actually exposed on three or more sides, ignoring the almost equally weighty geological evidence at hand. It is rare for an individual to frankly confess that estimates of ore reserves made during the year are "at best inaccurate and unsatisfactory" and that among the principal reasons given, it is stated that:

"Estimates of ore in sight have been made quarterly during the year, but these estimates are at best inaccurate and unsatisfactory, for the following reasons: First—Estimates of tonnage have been found to vary between wide limits, according to the methods used in making the estimates, and according to the engineer's conception of what is 'ore in sight.' It should be remembered in this connection that it is impossible in the normal conduct of mining to expose any large percentage of the ore on more than two sides; much of it is exposed only on one side. Second—It is useless to fix a tonnage without also fixing a value for the reserves. This is exceedingly difficult, and must necessarily be somewhat in the nature of guesswork, on account of the presence of some extraordinarily high-grade ore in the midst of large bodies of average ore. One shipment of 150 tons averaged $1400 per ton. One ton of 50-oz. ore is equal in value to 50 tons of 1-oz. ore, and a mistake of 1000 tons of 50-oz. ore is equal to a mistake of 50,000 tons of 1-oz. ore. In the Consolidated mine the high-grade ore is far more erratic than the average ore, and there is enough of it to make quite possible a mistake of several thousand tons in estimating it."

It can hardly be stated that these are weighty reasons, and it is hard to reconcile the difference of the same engineer's conception of what constitutes ore in sight within such a few months. Apparently, during the last quarter of the year, there was an awakening on the part of the management to a divergence between the actual condition of the ore reserves and the previously reported tonnages. The case in point is not only one of great interest to engineers, but also to mining capitalists and every mining stockholder in the country. The divergence between the published returns during three successive quarters and the summary for the year may cause a stock-market debâcle such as recently witnessed by the stock of the mine in question, thereby affecting the financial interests of thousands of stockholders who depended on the heretofore published reports of the company, suddenly to awake and find that a condition of affairs previously supposed to exist, had no foundation in fact. At this mine, according to my information, it has not been customary to hand-sample the faces of stopes, nor to use hand-sampling for the preparation of assay plans, the management rather depending for information on the result of grab samples of broken ore from development and stoping operations. That such practice may lead to error can easily be appreciated. Aside from the effect that a mine manager's report of ore reserves may have on the stock-market value of a property, the all-important question of professional justification of estimates made, should be the mainspring of the motive inspiring an engineer at all times.

Engineers are only human, and often are influenced to an extent greater than they realize by their surroundings, so that even an estimate of ore reserves may suffer from the physical discomforts an engineer may be subjected to at the time of his estimation, or, on the other hand, an undue inflation may be the result of psycho-suggestion from interested parties having a close familiarity with the property extending over a period of several years and who are thereby able to influence an otherwise cool judgment. The human factor in a mine examination is usually left out of consideration, but it is an important one.

The Iron Industry in Japan

By T. Haga

Great importanee is attaehed to the development of the iron industry by the Government of Japan, but in spite of the faet that the mineral production of the eountry shows a steady growth, the total production amounting to 110,000,000 yen* in Japan proper, it makes little progress. The amount of pig iron and steel produeed by the Government Yahata Iron Works at Kyushu is 150,000 tons per annum; adding to it the output produeed at Kamaishi and Senninyama under the eontrol of private corporations, the total output is plaeed at no less than 200,000 tons. On the other hand, the consumption of iron materials is approximately 700,000 tons. Foreign eountries must be depended upon to supply the remaining 500,000 tons. The imports of iron and steel for 1909 inelusive of bars, plates, pipe, and rails, were 500,000,000 kin in quantity and 21,092,000 yen in value, a deerease of 180,067,709 kin and 10,212,910 yen, respeetively, as compared with the preeeding year. This eurtailment of the industry is aseribable to the economie depression.

In 1909 England led in supplying the iron imported, furnishing 270,566,258 kin or 52% of the total; next eame Germany with 101,399,366 kin, or over 20%, and America, Belgium, China, and Franee followed in order. To depend upon the foreign market for a supply of iron is not only a great economie disadvantage, but it is neeessary to have domestie supply from a strategie point of view. The depression of the iron industry has been aseribed to the want of iron ore in the country, but the Tayeh mine (China), with whieh the foundry has contraeted for a supply for thirty years, beginning with 1903, possesses an inexhaustible supply, and in Korea there are many iron deposits. The real source of the depression of the iron industry in this eountry is the poor result obtained at the Government iron works as well as the diseouragement of private enterprises.

It is not fair to criticise the Government administration, but a deseription of the present condition of the Government iron foundry may be of service. To begin with, the foundry is situated at Yahata, Kyushu, west of Japan proper. It was established twelve years ago with a view to developing the domestie iron produetion in the faee of enormous imports, at the same time aiming at an independent supply of materials for ordnanee as well as for ship and railroad building. During this time there have been remarkable developments, but at an expenditure of 50,000,000 yen per annum and a yearly loss of 1,000,000 to 1,500,000 yen. Therefore the foundry is one of the diffieult problems in the Diet eaeh year. Thanks to the efforts of authorities eoncerned, Japan is tolerating the present expenditure and loss in expeetation of final sueeess. The yearly loss results from three eauses: (1) the high priee of eoal; (2) the laek of skilled workmen; (3) the want of iron. Coal, however, is not supplied to the works in question alone at a high rate. All industries in Japan are carried on with coal at the same price. With regard to the laek of skill by the workmen, the experience during the decade past should have been sufficient. Iron ore is not wanting in Japan proper, but the faeilities for importing good ore from China and Korea have prevented its development. The desired results have not been obtained by the Government works, and hence the yearly discussion of this question in Parliament. The Government is now considering the introduction at this session of Parliament of a bill to increase the capital to the amount of 15,000,000 yen for the purpose of increasing the yearly production 150,000 tons. This means that the Government may avail itself of the opportunity afforded by the tariff revision to take steps to check the imports of iron and iron manufactures. The members of the Parliament are not in favor of the Government works because of the losses incurred every year. It is expeeted, therefore, that there will be mueh diseussion during its passage through both Houses.

In such countries as Ameriea, England, and Germany, the iron industry is not carried on under Government patronage, but sinee conditions in Japan were so unfavorable in the beginning, it would have been difficult to have obtained good results speedily if the work had been undertaken as a private enterprise. The authorities consulted recommended that the portion taken under Government eontrol and the portion entrusted to private eoncerns be kept distinct, but the Government authorities did not follow this policy. A Government monopoly eheeks development in any industry beeause in the first plaee the methods of keeping aeeounts are too involved, and in the second plaee the officials carry on the work without striving to improve their methods. These are two reasons for the poor results obtained at the Yahata works. Therefore, well known authorities have declared that it would be wiser to turn them over to private enterprise. Unless, however, some indueement be offered, capitalists will not eare to undertake the management. It is possible that the hopes of the Government will be realized and that with the aid of heavy taxes on imports, and with an equipment of excellent machinery obtained by the additional capital, the losses of preeeding years may be reeouped, and even some profit made. In the meantime private works have been established in the north. In November 1910, Armstrong & Co. and Viekers, Sons & Maxim, Ltd., in co-operation of Hokkaido Colliery & Steamship Co., established the Nippon Iron Foundry, with a eapital of 15,000,000 yen and 10,000,000 yen debentures, of whieh mention in detail will be made in the future.

*One yen equals $0.50 gold; one kin, 1⅓ pounds.

In the ancient rivers of California some of the gravel is free washing—that is, it may be sluiced like ordinary gravel, but some of the ehannels are eemented more or less thoroughly with calcium earbonate, iron oxide, elay, or other matter, and the gravel requires some sort of mechanical disintegration before sluicing. In a few instanees the material is so firmly eemented as to require crushing by stamps, before the gold ean be freed.

Grand Gulch Copper Mine

By W. P. Jennings

The Grand Gulch copper mine is situated on the north side of the Colorado river in the Bentley mining district, Mohave county, Arizona, about seventy miles east of Moapa, Nevada, the present shipping point on the S. P., L. A. & S. L. railroad. It is on the high plateau forming the eastern rim of the 'Grand Wash', and one of the many plateaus or terraces that exist near the Grand Canyon of the Colorado. The rocks of the entire country are the flat bedded limestones and sandstones of the Plateau region. It is in the flat bedded limestones that the ore channel of this mine has been found, breaking through a sandstone capping of nearly one hundred feet to the surface. The ore channel is elliptical in horizontal section and measures about 200 by 300 ft. diam. The ore, consisting of malachite, azurite, chalcocite, and the red and black oxides of copper, all carrying a few ounces of silver, but no gold in the lower workings, extends out into the limestone along bedding planes. These beds extend out from the rim of the ore channel 20 to 30 ft. into the limestone, being 6 in. to 6 ft. thick and as much as 300 ft. long. The ore found in these beds is usually high in grade, being in some places pure chalcocite.

The inside of the ore channel, below the 100-ft. level, as shown by present workings, is not mineralized to any extent, being composed mostly of brecciated limestone mixed with some iron. The ore above the 100-ft. level, where it occurs in the sedimentary sandstone, forms beds very similar to those on the lower levels, but not so regular, and instead of extending out into the country rock, is found all through the inside of the ore channel. The ore is found to extend all the way around the channel at irregular intervals. The mine is worked through a double-compartment shaft now at a depth of 460 ft. The sulphide zone has not yet been reached and probably will not be for some distance.

The Grand Gulch mine was discovered by a Shiwits Indian about the year 1871. He made known his discovery to men living at St. George, a small Mormon settlement in the southern part of Utah, about eighty miles north of the discovery. The extreme high grade of the ore excited considerable attention. A mining company was soon organized and the property located. It was worked in a primitive way for several years. Several attempts were even made to smelt the ore. The long distance from a railroad made the shipping of crude ore impracticable and the smelting of the ore at the mine also proved a failure. The high cost of fuel and fluxes, together with the poor facilities for transportation, were too much for even such high-grade copper ore as that of the Grand Gulch. About ten years ago the extension of the railroad to within 140 miles of the mine and an 18c. copper market caused a revival of interest in the mine; the old company was reorganized and work resumed. For the next five years, with still a long wagon haul of 140 miles, the company, by shipping a product averaging about 48% copper, was enabled to do considerable development work and equip the property with a 25-hp. gasoline hoist and all the necessary tools and buildings for a working force of thirty men. When the Salt Lake route built through to Los Angeles, the wagon haul was reduced to 70 miles, and about that time copper moving up to about 25c., new life was put into the company. With brighter prospects, an active campaign of development was begun and the shipment of ore resumed. A lower grade of ore could then be shipped at a profit, and instead of sorting to a 48% grade, a more general average of the high-grade ore as found in place in the mine was maintained, the shipments assaying 35%. The high-grade ore is now being mined in sufficient quantities to carry on the development, $350,000 already having been sold to date. All the proceeds have gone back into the property except that which has been consumed in transportation, taxes, etc. Despite the obstacles encountered in mining so far from civilization and market, the mine pays its own way and keeps up its splendid standard of equipment both for the operation of the mine and the comforts of the employees. A considerable tonnage of 18% ore is being stored for shipment when the market or transportation conditions are a little more favorable, while a product of 6 to 8% is piling up in huge dumps all around the property.

The company operates its own stage line between the mine and the nearest settlement, 45 miles, where it connects with the stage line from Moapa, giving a weekly mail and express service to the mine. The freighting of ore to the railroad is done mostly by the farmers from the adjacent settlements. They freight when they are not busy putting in or harvesting their crops, and since they turn out in goodly numbers when they do come, they move all the ore the company cares to ship. Several six-horse outfits, which are kept continuously on the road, keep some ore moving all the time and take care of all back freight. The roads, though long, are kept in good condition and are better than most freight roads of shorter length. The climate is ideal excepting in midsummer, when it is extremely hot, the thermometer registering from 110° to 120° in the shade, and not much shade. The winters are mild, a fact that is very much in favor of the farmer freighter. At present there is an excellent prospect of the Salt Lake route building a branch line down the Muddy River valley, thus reducing the wagon haul from 70 to 45 miles, a comparatively short distance as against 140 miles. Every year the country grows and better facilities keep opening for the easier development of the property. As the mine is well worthy of all that can be done for it, it is only a question of a short time before it will be heard of among the big producers.

An inquisitive rancher in Nevada put a blast in the slag-dump of an old smelter site, some time since, and uncovered several thousand pounds of black copper that had leaked from the old brick stack built years previously, and which had for years been idle.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

The Clancy Process

The Editor:

Sir—In the *Mining and Scientific Press* of December 31, 1910, there appears an abstract of a paper presented before the Electrochemical Society, December 16, 1910, on 'The Clancy Process.' In the paper referred to, Mr. Clancy claims as novel the application of calcium cyanamide as a cheap cyaniding agent in the place of the more expensive sodium or potassium cyanide universally employed in the treatment of gold and silver ores by cyanidation. I beg to take issue with Mr. Clancy regarding his claims to originality in this matter. I can show priority in the application of this material to the extraction of gold and silver from ores. Mr. Clancy may claim some novelty, though of doubtful value, in adapting the use of calcium cyanamide to gold and silver extraction by means of electrolysis instead of the more direct method which I have proposed; its transformation into calcium cyanide by subjecting the cyanamide at a red heat to acetylene, water gas, or any hydrocarbon gas rich in carbon. This can be effected during the process of manufacturing the calcium cyanamide from calcium carbide. I cannot understand how Mr. Clancy could possibly have presented calcium cyanamide as a cheap and novel substitute of his own invention in place of the more expensive KCN or NaCN for use in the cyanide treatment of ores, when I had already written up its application several years ago.* The essential parts of the patent specifications are quoted below. The whole paper is easily available.

"In the treatment of ordinary gold and silver-bearing ore and tailing by the cyanide process, a cyanide solvent must be used which is not only stable in dilute solutions, such as 0.05 to 0.50% KCN, but must withstand exposure to the atmosphere as well, without decomposition. It must also not contain impurities, such as sulphide, carbide, etc., which would greatly depress the gold and silver-extraction co-efficient of the cyanide solvent. The cyanides ordinarily used, therefore, are the potassium and sodium salts, KCN and NaCN. These are highly refined, snow-white, and almost chemically pure. In this state they are sent to market for precious-metal extraction purposes, and are, necessarily, very costly; from 20 to 25c. per pound. In recent years, however, there has been great development in the cheap production of alkaline-earth cyanide, such as calcium cyanide, $Ca(CN)_2$, and barium cyanide, $Ba(CN)_2$, by means of the electric furnace, from atmospheric nitrogen. I have found that these electric-furnace products, even impure as they are, if they contain 80 to 90% of the theoretical quantity of cyanogen $(CN)_2$, may be adopted and used, in ammonia solutions, as gold and silver solvents. In carrying out my invention, the crude calcium cyanide or barium cyanide is dissolved in ammonia solution of sufficient strength, the insoluble residue solution to settle, and the clear solution applied in the treatment of gold and silver-bearing ore and tailing, not amenable to ordinary cyanide treatment, either on account of excessive cyanide consumption due to cyanicides, or on account of percentage of metals such as copper, nickel, zinc, or cobalt, which render inert the gold or silver solvent powers of a dilute cyanide solution (KCN or NaCN), such as is commonly used, and cause an excessive loss of the cyanide. A working solution, according to my invention, may be made up as follows: Solution of ammonia, 1% or less to 10% (NH_3); calcium cyanide or barium cyanide, 0.05 to 1%. If this solution be too alkaline, a salt of ammonia, such as the sulphate, may be added to counteract such excessive alkalinity. The treatment of the ore or tailing with this solution is carried out in any of the usual or known manners, as by leaching or agitating them with such solution; and, where the ore or tailing contains, in addition to the gold and silver, such metals as copper, nickel, zinc, or cobalt, all these metals are simultaneously extracted, and the separation of the gold and silver afterward effected in any ordinary manner. It will be seen that by my improvement, a very cheap gold and silver solvent is obtained, which overcomes all the objections and conditions above referred to."

Having thus described my invention, what I claim as new and desire to secure by letters patent is: (1) The improvement in treating ore and tailing containing gold and silver, which consists in extracting the precious metals with a solution of ammonia and alkaline-earth cyanide. (2) The improvement in treating copper, nickel, zinc, and cobalt ore and tailing containing gold and silver, which consists in simultaneously extracting all the metals with a solution of ammonia and an alkaline-earth cyanide. Then the following periodicals published articles and abstracts relative to the subject: *Mining and Scientific Press*, May 15, 1909; *Engineering and Mining Journal*, April 17, 1909, February 27, 1909; *Pacific Miner*, March 1910; *Mexican Mining Journal*, August 1910; *Chemical and Metallurgical Engineering*, May 1910; 'Mineral Industry,' Vol. 18, 1909, p. 365. In the above articles, abstracts, and letters, calcium cyanide as a cheap cyanide salt substitute produced from calcium cyanamide as per equation, $Ca_2CN_2 + C = 2Ca(CN)_2$, was several times noted and its use recommended by me as a cheap cyaniding agent for extracting gold and silver form their ores.

I trust I have made clear my position in regard to the Clancy process as relates to the use of cyanamide, and the cyanide-engineering profession may judge for itself if Mr. Clancy is entitled to any credit in presenting calcium cyanamide as a novel product for use in the cyanidation of ores. In its intended use, as described in his last paper before the Electrochemical Society, Mr. Clancy, perhaps unknowingly, but none the less certainly, infringes on my rights and prerogatives in the matter. The fact that Mr.

*See United States Patent 911,254, filed September 4, 1907, issued February 2, 1909.

Clancy employs iodide in conjunction with the cyanamide is of no importance to the intrinsic claim of employing cheap cyanamide as a substitute for the expensive cyanides of sodium or potassium. I trust you will publish the above in justice to myself and the cyaniding fraternity.

D. Mosher.

San Francisco, January 20.

The Editor:

Sir—After a careful perusal of Mr. Mosher's communication, a copy of which I am assuming was addressed to you, as it appears that copies have been sent to several leading mining journals, and after careful perusal of his patent specifications and other references which he has made in his communication, I fail to see any cause for discussion as to "priority" in the use of cyanamide in ore treatment. Nowhere, including his patent specifications, does it appear that he suggests the use of cyanamide *per se* as a solvent for the precious metals; on the other hand, he simply proposes, as many others before him have done, the use of calcium cyanamide as a starting point in the manufacture of calcium cyanide, by heating to a red heat calcium cyanamide with other materials in an electric furnace, and the product of this mixture—calcium cyanide—he proposes to apply to the treatment of ores. The German chemists, Messrs. Frank & Caro, many years ago attempted to produce cyanides by this means, but found that it was not a commercial success. I am reliably informed by those actively interested in the manufacture of cyanamides that fortunes have been spent endeavoring to apply cyanamide in a thoroughly practical and economical way, and they have very generously and frankly conceded that I have solved the problem. It seems to me that it would be more to the point if Mr. Mosher took issue with Frank & Caro for the determination of the question of "priority," for there appears to be little, if any, difference in the result finally accomplished by either of them, since they were apparently working along the same lines and the results quite naturally were the same. It will be apparent to anyone reading Mr. Mosher's specification that he does not use cyanamide in the cyanide solution, but proposes to use his electric-furnace product, which contains calcium cyanide of about 80% cyanogen content prepared by secondary electric-furnace treatment of cyanamide, as already described. In the Clancy process any amide or amidine compound may be used in conjunction with the cyanide solution, such, for example, as urea, or guanidine. The idea of my infringing any rights and prerogatives of Mr. Mosher is amusing. Why does not Mr. Mosher claim priority to an amide or amidine compound in conjunction with the cyanide solution?

I trust that I have made the distinction clear between the Clancy process relating to the use of cyanamide in the cyanide solution, and the use of the calcium cyanide product prepared from calcium cyanamide by special treatment as described by Mr. Mosher. It is clear from reading Mr. Mosher's specification that he does not attempt to claim the use of raw cyanamide in the ore-treatment process, for the simple reason that he was not aware of the fact that cyanamide, amide, or amidine compounds could be used in conjunction with cyanide solution until the publication of my patent specifications and the articles which I have written describing my process.

John Collins Clancy.

Recent Cyanide Practice at the Montezuma

The Editor:

Sir—In your issue of January 28, 1911, appeared an article by S. F. Shaw, entitled 'Recent Cyanide Practice at the Montezuma, Costa Rica.' In this article Mr. Shaw speaks of the clogging of the spiral feed and also says that this feed throws out sand from time to time. In publishing this statement we are inadvertently done an injury. The explanation of Mr. Shaw's trouble is quite simple. He is feeding the material entirely too thick. We have never heard of a tube-mill being fed with ore containing less than 37% moisture and do not understand how he is able to do any satisfactory work with the mills under the circumstances. In most plants the solution is 1:1, but, of course, it varies on different materials. If Mr. Shaw will have his material fed to the mill with at least 40% moisture he will overcome the difficulty and may also possibly increase the grinding capacity. Furthermore, if the mixture is of the proper consistence he can pump the mill two-thirds or three-fourths full and in that way partly balance the machine and reduce the horse-power required.

Abbé Engineering Company.

Surface Indications of Ore-Shoots in Depth

The Editor:

Sir—Concerning the supposed rule of ore-shoots in relation to gulches, which generally has failed of application at the various mines and prospects that have been under my observation, a parallel case suggests itself when viewed from a practical standpoint. Readers of technical literature are doubtless more or less familiar with what has been written of the Comstock lode and will recall that it has been mathematically demonstrated that the slope of one side of Mount Davidson is in the form of a logarithmic curve and that prospectors in search of another such ore-body have been advised to scan all hill slopes looking for that curve. In this case one reader, who was certainly either sordidly practical or an irreverent wag, suggested that prospectors should include in their packs a set of templets, using them to sight against the profile of the hills and thus save many weary steps. If the subject under discussion affords some such 'practical' suggestion it will doubtless be welcomed by many who would otherwise have to depend upon the single jack and its attendant exertion for a solution of their problems.

R. P. McLaughlin.

Taft, California, January 27.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Loadstone, magnetic iron oxide, is frequently found, but is not a regular article of commerce. There is a demand for it in small quantities in hand specimens.

No stone containing much iron or other sulphide mineral is suitable for ornamental purposes, or even for building, as it is likely to weather rapidly and crumble.

Copper may often be removed from ores where cyanidation is to be undertaken, by leaching with ammonia, and precipitating by blowing live steam through the solution. Following the leaching ammonium cyanide and then straight cyanide solution should be used.

Launders must be given slope according to the character of the material to be carried and the proportion of water in the pulp. At the Steptoe concentrator at Ely, Nevada, 1½ inches to the foot is the rule. With a 6 to 1 ratio of water to concentrate, a grade of 2 inches to the foot should be allowed.

Costean is a Cornish word coming from *cothas*, meaning dropped, and *stean*, the latter probably from *stannum*, ten. To costean is to sink a series of pits or a trench through the overburden in order to trace a vein. Roughly, costeaning is the same as trenching, and it would be better to use the common English word.

A 12-in. pipe, one mile in length, with a head of 80 ft., will deliver from 4 to 5 cu. ft. of water per second, the difference being due to the condition of the interior of the pipe, a smooth pipe carrying more than one having a rough surface. A 17-in. pipe under the same conditions will deliver 10 to 13 cu. ft. per second.

Mast machines for drilling have long been used for shallow work, but are now coming into wider use. Recently a hole 3500 ft. deep was drilled near Pittsburg with a Star machine. When a well does not need to be frequently cleaned, so that a permanent rig is unnecessary, there is economy in lumber in using the mast rather than derrick.

Manufacturing establishments where mining and metallurgical machinery is made, have, or should have, experienced engineers whose duty it is to plan machinery for special purposes. Without this expert advice and assistance, the mill founder can not hope to enter into successful competition with those concerns that have such men on their staff.

To determine the value of gold per ton of ore in the sulphides present is easy when the assay-value of the sulphides per ton and the percentage of sulphides in the ore are known. For example. An ore contains 3½% sulphide, which concentrated assays $60 per ton. Multiply the percentage by the value and divide by 100. Thus 3½ times $60 is $210, which divided by 100 gives $2.10, the value of gold in the sulphides in a ton of ore as it comes from the mine.

Cy is often used as the symbol of cyanogen in place of the proper symbol CN. This arises from the early belief that these atoms were held in a union different in some way from the ordinary one. This is now recognized as a mistake, but the incorrect usage still persists, apparently because the wrong symbol is a little easier to write than the correct one.

Never cut a shaft so small that all work to be done in it cannot be readily accomplished without being cramped for room. The manway and pump-compartment particularly should be of liberal size, as it must contain the ladders, the compressed-air and ventilating pipes, water column, and sometimes also a steam-pipe. The pump must also be handled in this compartment, and to have to work in a cramped position is far from economical. It were better by far to make the shaft an additional two feet in length.

Platinum is much used in chemical apparatus, but is expensive, and many attempts have been made to substitute cheaper materials. Plating platinum on a cheap base is unsuccessful, as the outer plating quickly separates from the inner base metal. Often articles made of nickel or nickel-chrome alloy may be used, but in most cases the prime requisite is accuracy, and it is not good business to sacrifice the accuracy for the sake of cheapness. Where accuracy is not essential, cheaper materials may be used, but it should be remembered that if an article which costs three times as much lasts three times as long it is cheaper because it saves the trouble of frequent replacement and the lower efficiency of using an article which is nearly worn out.

Testing placer ground is exceedingly difficult where the water is so abundant as to prevent sinking test pits. The usual method is to put down holes with either hand or power drills. It is customary to first drill a series of holes across the valley or ground to be prospected, dividing it into two or three blocks. If these holes yield good results the ground is systematically tested by means of holes placed in rectangular pattern at intervals of 200 feet. This amounts to one hole per acre. Systematic work of this sort in places costs more than the ground itself. Even then results are not certain. Tests on one piece of ground in California indicated a value of 18 cents per acre where the dredge recovered but 12½ cents. In another case the yield was 18 cents where the drill showed nothing. Still another dredge recovered 60% of the amount indicated by prospecting, at the same time that another dredge belonging to the same company was recovering over 200%. In a rough way, it may be stated that California dredgemen expect a recovery of 70% of the gold indicated by drilling.

Special Correspondence

NEW YORK

The Copper Market.—A Shrinkage of Domestic and Foreign Deliveries. — Giroux Annual Report. — Heinze's Affairs. — Ray Con. and Chino.— Michigan Producers. — Possible Globe Merger. — The Morning Mine.

The unfavorable report of the Copper Producers Association was foreshadowed by a general weakness in the metal market and a consequent decline in the shares of several of the leading copper issues. The adherents of the so-called policy of curtailment are pointing to the fact that January production declined 7,633,628 lb. as compared with December. Domestic deliveries were disappointing, while the export demand, which was phenomenal in December, showed a shrinkage considerably larger than was expected. There was no expectation that exports would continue at any of the record-breaking figures of December, but it was hoped that the inevitable reaction would not appear immediately, nor all at once. On the other hand, it was hoped that the conditions at home would show some improvement; the December deliveries for domestic consumption were small and January should have shown an increase. Consumers in this country, however, evidently take the position that copper cannot advance under present conditions, and are content to buy only for immediate needs.

Giroux among other stocks has been made the object of attack by bear traders. The shareholders in this company have for some months been inquiring why no definite statement as to the developed ore reserves was forthcoming. In the annual report, just issued, the ore developed by the churn-drills is estimated at 9,620,000 tons, with an average copper content of 1.36%. Inasmuch as 2% ore is considered about as low in copper content as can be worked profitably, and as previously current estimates had allowed at least double the tonnage reported, traders proceeded to sell Giroux upon the publication of the report and drove the stock from $8 to $6.25. The gold and silver in Giroux ores amount to about 60 cents per ton, making the gross value approximately $3.40. Some comparisons are drawn, as might be expected, between Giroux and Nevada Consolidated, but these are hardly fair. It has never been planned, or at least the public has never been apprised of any plans, to give Giroux any such equipment as that of the Nevada Consolidated, nor has it ever been contended that it would be possible in any event for Giroux to handle its ores as those of the steam-shovel pit of the Nevada Consolidated are handled. It may be added that the statement made as to Giroux ores does not include the ores in the Alpha workings on the limestone contact, where some comparatively high-grade ore has been developed, but which is not yet in shape to be properly measured.——The situation as to Davis-Daly has become acute; when it was learned that F. A. Heinze's reported purchase of property in Porcupine had been made at the expense of the Davis-Daly treasury, the New England shareholders began to organize in opposition. A hundred shareholders came together in response to a call issued by six Boston Stock Exchange houses, and while they were unable to force Mr. Heinze to resign as president and director, they did force his consent to the shareholders having a majority upon both the board of directors and the executive committee, and also forced from him a statement as to what was being done with the funds in the Davis-Daly treasury. Resolutions were adopted disapproving of nearly everything Mr. Heinze has done and particularly his virtual abandonment of the Davis-Daly property. With $330,000 in hand belonging to the company, Mr. Heinze has been engaged in prospecting; expending $20,000 in Alaska and $25,000 in Porcupine, the latter under a personal guarantee from himself, in return for which the company is to pay him one-third of any profits made. The only justification Mr. Heinze is said to have claimed in making such expenditure lies in there having been expended some $1,800,000 in Butte without having made a mine of the Davis-Daly, and that he thought he could do better looking elsewhere. Evidently the necessity for any formality, such as consulting with the shareholders before taking action, never occurred to Mr. Heinze. Between being asked to resign from Ohio Copper, in order that its bonds may be sold, and being asked to resign from the Davis-Daly, on account of alleged unauthorized expenditure of funds in the treasury, and being subjected to a constant fire of interrogations about what became of the funds in the United Copper treasury, F. Augustus is fairly busy.

Ray Central shareholders, who have been awaiting the promised report on the properties to be made by Weed & Probert, are evidently to be forced to be satisfied with the conclusions drawn therefrom by the officials. The vice-president has issued a statement to the effect that he considers the report highly satisfactory; that developed ores show a minimum of 7,000,000 tons. Ray Central is suffering from a lack of confidence in the public, which evidently is strong enough to prevent frank treatment being shown, which in turn has induced the public to put the worst construction upon the fact that desired reports have not been forthcoming when expected, and upon the fact that the identity of new investors said to have come into the company recently has not been revealed.——Ray Consolidated and Chino are about to leave the open, or Curb, market and will hereafter be traded in upon the floor of the New York Stock Exchange. The fact that the listing committee of the Exchange has admitted these companies to trading privileges, while both are yet really in the development stage, marks a great change in the attitude of the 'big board', foreshadowing a further recognition of the public interest in mining issues. The Guggenheims are reported to have taken over a large holding of Yukon Gold, amounting to some 20,000 to 25,000 shares, that had been held in England. Whether this move has any connection with the rumored merger of all of the Guggenheim properties is not known. The Michigan copper producers are exercised over the possibility of the imposition of a State tax of ½c. per pound upon the copper output. The Northern and Southern peninsulas of Michigan are widely separated; in fact, that part of the State known as the Northern Peninsula is geographically, politically, and commercially treated as a separate bailiwick. The farmers, fruit-growers, and automobile manufacturers of southern Michigan are frankly sectional in their attitude toward the mining interests of the Lake country. Boston is much closer to the Lake Copper region than is any part of the 'peach belt.' As a result, the copper forces are lining up to defeat the measure. The tax would cost the Calumet & Hecla $357,500 yearly, or more than $3.50 per share on its present outstanding capital.——There have been rumors of consolidations to be made in the Globe district in Arizona. The latest story is of negotiations for a merger of the Miami, the Inspiration, the Live Oak, and the New Keystone. This consolidation, if consummated, would bring together some interests which, heretofore, have not been closely allied. The Miami and the New Keystone are controlled by the General Development Co., which is a Lewisohn organization; the mine work being under the direction of J. Parke Channing, as consulting engineer and managing director. Inspiration is controlled by the Thompson-Gunn interests, who are allied with Salt Lake capitalists and who control also the Mason Valley at Yerington, Nevada. Through the connection of these people with the important Stock Exchange house of Thompson, Towle & Co., they are also in touch with the Boston investors in copper. Live Oak is also now controlled by Boston people. There is a story in mining circles that when the Lewisohns bought the Miami, what they really wanted was the Inspiration, and there is no doubt that, on acceptable terms, they would welcome a merger with the latter property. Should a new concern be formed, as outlined, it would immediately take rank as one of the important porphyry mines, as it would have a present developed tonnage of 50,237,000 tons; Inspiration having 21,737,000 tons, Miami 16,500,000, Live

Oak 9,000,000, and New Keystone 3,000,000 tons. Such a new organization would be the dominent factor in the Globe district, and, as the Miami mill is soon to begin operating, would be one of the first of the developing porphyries to produce on a large scale.

There is a renewal of interest in the affairs of the Federal Mining & Smelting Co., and some tipsters have been industriously circulating advice to buy the shares. The Morning mine, the largest producer of its properties in the Coenr d'Alene, is apparently coming back as a profit earner. The change in the ores has been met by a new method of treatment, and conditions have so far improved that instead of a monthly deficit, the Morning mine is now earning $15,000 net mouthly, and from the present outlook it is expected to double or treble this figure.

Engineers in the Cobalt camp are much interested in a recent discovery of high-grade silver ore in the Temiskaming mine at a depth of 535 ft., which is the deepest working in the district. The Temiskaming is entirely in the Keewatin, while most of the large prodncers, such as Nipissing and La Rose, are in the conglomerate. In the diabase there are only two paying ore deposits, the O'Brien and the No. 3 vein of the Kerr Lake. It has been the rule in the camp that wherever the conglomerate overlies the Keewatin, the values are found entirely in the conglomerate. While, therefore, the finding of ore at depth is important to the few properties that are entirely in the Keewatin, it does not determine the real question of the valne of deep ore at Cobalt.

LONDON

Output and Profits of Ashanti Mine. — Copper Mining in Australia. — The Phillips River Operations. — The Huelva and Rio Tinto, Spain.—The Cordoba.

The Ashanti mine continues to be the most important gold prodncer in West Africa. While most of the mines in the Tarkwa and Prestea districts are suspending production dnring vigorous development, the Ashanti goes forward in a most encouraging manner, discovering rich oreshoots and erecting modern machinery. This mine has the advantages both of good fortune in the way of ore deposits and of capable direction of operations. Some mines are made famous by nature and some hy the strennous efforts of man. The Ashanti affords an example of a combination of these two influences. A year ago in this column, I quoted W. R. Feldtmann's account of the discoveries of rich ore in the Obuasi workings of the Ashanti mine and of the new plant then in course of erection. Mr. Feidtmann has recently issned a report bringing technical details up to date. During the year ended June 30 last, 90,860 tons of ore was sent to the mill and 72,115 oz. gold recovered, the value being £306,322. This was the largest yearly prodnction yet recorded. The working profit was £175,716 and the net profit was £118,878, as compared with £44,792 the year before. As a large sum was brought in from the last year, it has been possible to distribute £149,580 as dividend, being at the rate of 75%. As regards ore reserves, the content of gold is estimated at £1,910,000, as compared with £2,000,000 a year ago. Owing to floods, and also because attention has been centred on the building of the new metallurgical plant, less development work has been done than would otherwise have been the case. Generally speaking, the developments at Justice's mine have not been so favorable, but this has been more than compensated by the discoveries in the lower levels of the Ashanti mine, in a different part from the Obuasi discoveries mentioned above. Mr. Feldtmann reports that the fourth or last unit is now practically complete and that, commencing with 1911, the yield of gold should be £40,000 per month.

The production of copper in Australia is confined to a few districts. Mount Lyell, Cobar, and Wallaroo were the only notable districts for many years. More recently Mount Morgan has been an important producer, and North Queensland has come forward. Other mines, such as Great Fitzroy in Queensland and Whim Well in the north part of Western Australia, have attracted attention. I wish in this letter to make a note of the strenuons efforts that have been made in the Phillips River division of Western Australia, situated between Kalgoorlie and the Sonthern Sea, to develop copper deposits. The Phillips River Gold & Copper Co. was formed in 1906. Part of the property acquired was sold shortly afterward to a subsidiary company called the Mount Cattlin Copper Mining Co., but has since been repurchased. A railway was bnilt to connect the mines with Hopetown, and a smelter and concentrating plant were bnilt. The orebodies have proved disappointing so far. Development has been centred on the Desmond-Elverton group of lodes, and at some points promising ore was found. Some development has also been done at the Monnt Cattlin mine. At the Ironstone property prospecting has been done by diamond-drilling. The Benson and Martin mines have been leased and a few hundred tons of ore raised by the tributers. The profitable oxide ores are exhausted and the smelter which started in July 1909 is now treating chalcopyrite from the Elverton and Cattlin mines and cupriferous pyr-

Metallurgical Plant, Ashanti.

rhotite from the latter, together with such ore as is raised by the tributers at the other mines. Pyritic smelting was tried, hut it was found that the gangue matter required more heat. The plan now is to pick out the richer parts, concentrate the remainder, and sinter the concentrate. In this way the refractory gangne is largely removed, and a smelting charge obtained which contains sufficient sulphnr to reduce the amount of coke required to a minimum. In addition to the blast-fnrnace, a converter plant has been erected. Dnring the past year 1332 tons of blister copper was produced, containing 1318 tons copper, 5435 oz. gold, and 9982 oz. silver. The Income from the sales was £62,466, and the loss on the year's work was £55,431. The expenses in connection with the starting of smelting and concentration made the costs higher than they will be in future. The company has an excellent plant, and a satisfactory method of treatment has been found. The futnre will depend on the development of the ore deposits.

Copper mining in the south of Spain has had several setbacks lately. One of the most serious accidents has been at the Hnelva copper and snlphnr mines, which are under the capable management of H. F. Collins. The dam erected a few years ago for the purpose of conserving a water supply burst, and not only disorganized everything, but caused the death of many employees. Further news comes from the Rio Tinto mine relating to landslides, and several deaths have recently been caused by this unsafety of the gronnd. It must be remembered that the Rio Tinto pyrite deposit is being worked by open-cuts, and that of recent years it has become obvious that the slope of the quarries is too steep for safety. Vast snms have been spent out of the reserve fnnd for the purpose of removing the dangerous overburden, but in spite of this, landslides are still occurring, and the engineers and workmen are well aware of the threatening state of things. As the directors of the company keep a vigilant control on news from the mine and publish nothing but the barest of half-yearly reports, neither shareholders nor the public have the least idea of the mining or metallurgical practice. It is a pity that they do not issue some authoritative statement, convincing to a mining or civil engineer, to the effect that open-cut work-

ings are permanently safe and do not threaten to collapse and bury the pyrite. In the absence of such information it is not to be wondered that in some quarters the most sinister opinions are freely expressed. One of the copper mines in southern Spain that has had troublous times is the Cordoba. The present English company was formed in August 1908 as a consolidation of the companies operating the Cerro Muriano and North Cerro Muriano copper mines, which are situated ten miles northeast of the city of Cordoba, Spain. John Taylor & Sons are the managers. The ore deposit has been difficult to follow and work, and the concentration and smelting problems have given trouble. The directors now speak more cheerfully and report that in many ways the company is in a more favorable position. Recent developments have disclosed valuable bodies of ore and the reserve has been increased, now standing at 132,903 tons averaging 3.28% copper, an increase of 10,508 tons in quantity and ¼% in value as compared with a year ago. During the year ended September 30 last, 62,299 tons of ore was raised, and sent to the picking floors. Of this, 19,943 tons was sent to the old jigs and buddles, 12,790 tons was treated in the new wet-concentration plant, and 11,198 tons went to the magnetic separator. Some of the sorted ore was sent direct to the sintering furnace. The old jigs and buddles and the magnetic separator have recently been abandoned and the whole of the output in future will go to the new mill. The Murex magnetic process has been installed for the treatment of 50 tons per day of middling and tailing from the jigs, and it promises to give satisfactory results. Sintering by pot-roasting was adopted for smelting. Hitherto the metallurgical processes have ended with the production of matte, but it is now intended to erect a converting plant.

BUTTE, MONTANA

Source of Heat in Butte Mines. — Means Adopted for Natural and Artificial Ventilation.—Fire on High Ore not Spreading.

In discussing the conditions in the Butte mines before the legislative investigating committee, John Gillie, general superintendent for the Amalgamated company, made some interesting statements regarding the temperature in the mines and the means being adopted to remedy some of the complaints made by miners. He said at the outset that the high temperature was difficult to overcome on account of the vast amount of lumber used, and the kind of ore existing in the mines. He explained this statement by saying that the mines of the company used every year 75,000,000 ft. of lumber of board measure, about 250,000 round timbers, and 275,000,000 ft. of sawed timber. Mr. Gillie said that just as soon as this timber goes into a mine oxidation begins to take place, and it is just the same as burning it, so much heat does it throw out. It may be distributed over 20 years, or 40 years, but the same amount of heat units in a stick of timber, if it be entirely rotted, is given off as though it were burned in a stove. In speaking of the character of the ore, he said it is sulphide, or contains sulphur and other compounds, and an oxidation is going on in the rock itself which produces heat. Then again, it was pointed out that the deeper you go into the earth the warmer it becomes. For some years the company was devising plans to overcome, as far as possible, the complaint about the heat, and during the past four years had equipped many of the mines with a system of forced ventilation, and at the present time, through this means, 753,000 cu. ft. of air is being put into the mines every minute. In addition a number of natural or induced-air openings or ventilating shafts have been put in. At some of these the air is being forced in, while at others the warm air is being taken out, which has to be replaced by cooler air from other places. He said the system had been found to be effective. Mr. Gillie then spoke of the underground workings of the Gagnon, the deepest mine in the district, and said that on the 2300-ft. level efficient work could not be done, as the men came to the surface at the end of the shift more tired than they would be with twice the labor on the surface. An exhaust fan was placed on the air-course as soon as it was possible to secure the electric power, with the result that the 2200 and 2300-ft. levels, the deepest in the Gagnon mine, were made comparatively good places to work. The difference could be noticed in a short time. He said that in addition to this, the company was now sinking an air-shaft in the Gagnon down to the lowest level, a piece of work which would cost $230,000. He concluded his statement regarding the temperature question with these words: "Now, we are not doing that as philanthropists; we expect to get the value back on the number of tons of ore per day per man; it is economic mining. It tends, of course, to the better health and the better conditions of the miner, and the better he is, the better it is for us."

The fire in the High Ore mine is still burning, but there is no probability of it spreading. It is confined to a limited space, and no smoke is interfering with the operation of other mines. The pumps are working on the 2800-ft. level, and the water has practically all disappeared. It will be two to three weeks before the mine is again in operation, the management not deeming it advisable to hurry the resumption of work, especially when the other properties are supplying all the ore required by the smelters. The copper production of Butte district for January was nearly 23,000,000 lb., including a little over 1,000,000 lb. from the East Butte smelter. The Washoe smelter produced 15,950,000 lb., and the Great Falls smelter 5,650,000 lb., making a total of 21,600,000 lb., which includes the ore treated at the Washoe smelter belonging to the Tuolumne company. The management of the Raven Copper Mining Co. is doing development work on the Snoozer, through the Old Glory shaft, in accordance with an agreement reached with the Anaconda company. From the 200-ft. level of this shaft a cross-cut now in 300 ft. is being driven to intersect the vein, which will be reached 50 ft. ahead. The shaft is down 500 ft., at which depth another cross-cut is being driven to the Snoozer vein. On the 200-ft. level four veins were cut and raises were made to get an idea of the dip of the vein. An impression has gotten abroad that the Colorado mine of the Davis-Daly company is completely shut down, but such is not the case. There are about 25 men at work on development on the 1400-ft. level on which a large body of ore has been uncovered. However, as it assays only about 3% copper, it would not pay to ship it at the present market price.

REPUBLIC, WASHINGTON

Interesting Data on Lone Pine, Pearl, and Surprise.— The Quilp and Knob Hill.—Belcher Mountain.—Treating Tailing.

The Republic Mines Corporation has made final payment and taken over the Lone Pine, Pearl, and Surprise mines from the Pearl Consolidated Mining Co. The superintendent reports continued improvement in the Surprise vein workings, during the last ten days. In the winze south of the 'Jim Clark tunnel,' 40 ft. below the adit-level, 8 ft. of ore, reported to assay from $225 to $400 per ton, mostly in gold, is expanding about an inch with every foot of increasing depth, and 6 ft. on the hanging wall assays close to $40 per ton, and is spreading toward the centre with every round of hole, but more gradually than on the foot-wall. The pay-shoot at the surface was 150 ft. long and 5 ft. wide; at a depth of 50 ft. it is reported to be 200 ft. long, with an average width of 12 ft., the extreme width being 18 ft., with a pitch of 70° east and rake of 50° south. The pay-shoot has been cut into on the first level from the incline shaft, designed for opening the vein at greater depth, at 190 ft. from the portal and 75 ft. below the bottom of the winze. The superintendent reports that from 8 ft. of quartz already penetrated, samples have been taken, but not yet assayed. The quartz is identical with that of the foot-wall. Next the foot-wall the material is the typical white quartz, with ribbon streaks and spots of rich sulphide which characterize the best ores of the camp. A winze has been started on the 300-ft. level of the Lone Pine claim, 150 ft. east of the main shaft, and is following down on ore which assays about $50 per ton, principally gold.

The company is shipping about 150 tons of ore per week from the Lone Pine and 450 tons per week from the Surprise.

The Quilp mine is sending 300 tons weekly to the smelter of good-quality ore, and some of it is very high grade. The Knob Hill mine is now being opened on four levels. On No. 1 ore is being mined and sacked which assays about $100 per ton, nearly all in gold, from a small lateral vein. On No. 2 the main north-south vein has been followed continuously about 400 ft. from the portal of the adit, and the breast is 165 ft. below the surface. That vein is from 3 to 8 ft. wide, and a stope has been started on ore which assays from $24 to $30 per ton, practically all gold. A raise is being made on a small vein of $25 ore from the No. 4 level. Ore is being delivered from the three levels to the ore-bin, lately constructed beside a railway spur on which the track is laid, but awaits the track bolts for completion. The mine is being put in shape for delivery of ore from each of the four levels through the underground workings instead of hauling it around the hill as at present. The Pearl Consolidated Mining Co. has one more dividend of about 1⅓ cents per share to pay, which may be paid early in March, and the affairs of the company will be closed. A streak of iron carbonate ore has been developed above the lower adit of the Anonymous mine, on Belcher mountain, which may form the connecting link of the vein system between the Belcher, Copper Key, and Oversight mines. The mines of Belcher mountain are practically idle, awaiting plans by the various companies for the future disposal of the ore. Republic and neighboring camps are witnessing a revival of mining and other interests. The tailing dumps at the old Republic mine, after lying many years apparently worthless, are being worked over and are reported to be paying a profit. The first clean-up has been made with good results, but information on details is lacking. Good headway is being made on the new mill of the North Washington Power Company.

TORONTO, CANADA

Porcupine Railroad and its Terminal.—Three Townsites may Unite.—Hollinger Development and Ore Tests.—Special District News.—Cobalt Mines.

The route of the Porcupine extension of the Temiskaming & Northern Ontario railway and its terminal at the camp were definitely settled last week after the return of J. L. Englehart, chairman of the Railway Commission, from that locality. The line enters to the north of Porcupine lake, a station being placed at Golden City, and runs down the southeastern shore of the lake, its present terminus being about one mile from the Dome property. The decision has given stimulus to building activity and dealing in real estate. It is anticipated that the line will be ready for traffic by the end of June. Although the snow is 3 ft. deep, 700 men are at work clearing, grading, and laying the steel. Next month the force will be increased to about 1200 men. A movement is on to unite Porcupine City, Golden City, and the Welsh Townsite, incorporating them as Porcupine.

At the Hollinger sinking has been done to the amount of 365 ft., and 1040 ft. of driving has been accomplished at the 100-ft. level. Two shafts are down to this depth and a winze has been sunk 100 ft. farther. Assay tests of the ore have been made from the outset, and there have been returns from the 2-stamp mill. The result of sampling and assaying shows an average of $49.80 in gold per ton, and returns from the stamp-mill give an average of over $50 gold per ton from a saving of about 85% effected without concentration, thus proving the free-milling character of the ore. P. A. Robins took charge as manager February 1. The Scottish Ontario company, which has been driving at the 100-ft. level to recover the vein which was lost at 54 ft. in the shaft, has been successful. The vein where opened was over 10 ft. in width, the ore containing free gold. On the Vipond, operated by the Porcupine Gold Mining Co., controlled by the Flynn Bros., of New York, a shaft has been sunk by the side of the vein for 100 ft. and a crosscut is being run to cut the vein. Another vein shows rich ore on the surface, which is being mined to supply ore to a small Nissen stamp-mill. The ore is stated to run $500 in gold per ton. A large mill will be built next summer. Good surface ore has been discovered on the Crown Chartered property, including a continuation of the Scottish Ontario vein. A contract has been let for diamond-drilling to the depth of 1000 ft., work to be commenced February 15. A syndicate, comprising P. Chester Thompson, W. S. Edwards, George Monteith, Alex. Fasken, and John Watson, has acquired a controlling interest in the Dome Extension property of 200 acres situated south and west of Porcupine lake. Two prospecting shafts have been sunk and a plant installed. The Standard Porcupine Gold Mining Co., capitalized at $1,500,000, has been organized to operate a property of 65 acres near Simpson lake. Dr. Guerin, mayor of Montreal, is president, and C. S. Wallace secretary-treasurer. Among recent visitors to Porcupine were F. Augustus Heinze, of Butte, and James Doyle and James C. Sweeny, of Denver.

Cobalt is attracting but little attention in view of the greater interest attaching to the rapid development of Porcupine. A rich discovery is reported at the Crown Reserve, a stringer encountered on the 200-ft. level having widened to a vein of 2 in. wide, carrying high-grade ore. The annual statement presented at the Crown Reserve shareholders' meeting at Montreal, January 25, reported ore production to the value of $1,757,824, and net profits of $1,185,100. After paying dividends and expenses of operating the Silver Leaf leasehold, a surplus of $659,986 remained on hand. Hereafter a dividend of 5% per month will be paid instead of 15% quarterly. The La Rose Consolidated sent out a statement accompanying its dividend checks showing $708,470 cash in hand and in value of ore in transit and at smelters, and $303,343 in value of ore sacked for shipment. The critics and commentators have again begun figuring as to the probability of a resumption of the old rate of dividend. The shaft of the Gould Consolidated, now down 121 ft., is to be sunk 50 ft. farther, and driving will be undertaken on the 150-ft. level. The Kerr Lake has opened a 6-in. vein, in driving from the bottom of winze No. 4, which is said to carry 3000 oz. silver per ton. The Wettlaufer of South Lorrain has declared its initial quarterly dividend of 5%. The Coniagas has declared dividends amounting to 9%, bringing the total returns up to 44% of the capitalization. The miners at the Keeley mine, in South Lorrain, have been out on a strike since January 16 against a reduction of wages.

KALGOORLIE, WESTERN AUSTRALIA

Output and Dividends for November.

In the table below is given the November record of the principal mines of Kalgoorlie, Western Australia:

Name.	Tonnage.	Yield.	Profit.
Associated	9,601	$ 68,000	$ 7,400
Associated Northern	2,371	19,000	5,000
Bullfinch Proprietary	399	105,000	.....
Chaffers	4,156	25,500	350
Golden Horseshoe	19,507	124,500	27,500
Golden Ridge	2,610	35,500	15,000
Great Boulder Perseverance	20,008	119,000	18,000
Great Boulder Proprietary	17,892	248,000	130,500
Great Fingall	10,291	79,500	14,000
Hainault	5,066	35,500	5,400
Ivanhoe	19,327	209,000	100,000
Kalgurli	10,740	138,000	75,000
Lake View & Star	13,005	78,500	6,500
Oroya-Exploration	21,706	24,500	11,500
Oroya Black Range	4,490	45,000	12,000
Oroya Links	7,070	43,500	4,400
Sons of Gwalia	13,490	117,500	50,500
Sons of Gwalia South	2,103	17,000	2,400
South Kalgurli	9,235	63,000	4,700

The properties which paid dividends are as follows: Lake View & Star, $87,500; Links, $71,500; South Kalgurli, $50,000.

SALT LAKE, UTAH

General Mining Affairs of the State. — The Trouble in the Coal Regions.—Snowslides.—Merger at Alta.

The new tramway of the Utah Consolidated has been brought to a state of efficiency materially reducing the cost of transporting ore to the International smelter. Suit has been commenced against the Ohio Copper Co. to recover $7500 due for machinery and supplies. It would hardly seem that Ohio has been making the money credited to it when such a suit is filed. The North Utah has gone into the hands of a receiver, due to the fact that plans to finance it by means of a bond issue were unsuccessful. The holdings include the Butler Liberal, which is well equipped, but the result of development work during the past year or two was not satisfactory. The Utah Metal tunnel has been advanced 4400 ft., and has cut some deposits of ore of commercial value. The flow of water has increased, which is taken to indicate that the mine workings are being drained through the tunnel. The Montana Bingham miners have cut 3 ft. of ore in the south drift which assays 13% copper, 13 oz. silver, and $4.80 gold per ton. The heading of the main cross-cut should reach the Quinn fissure at 350 ft. farther.

Greater headway has been made in the Snake Creek tunnel during the last month than in any previous month, the face having been advanced 367 ft. Progress was averaging

Slime Plant of the Ohio Copper Company.

15 ft. per day until an unusually hard formation was entered, which made the rate slower. The face is now in 2800 ft. The new vein found on the 900-ft. level of the New York mine at Park City, has been followed 140 ft. and is still holding out well. Stoping has not been commenced, but a few carloads of ore have been shipped as the result of development operations. The New York has struggled through 25 assessments, but prospects are that it will pay its way from now on. The most important event in Tintic district for some time was the adjustment by stipulation of the suit between the Beck Tunnel and the Uncle Sam. The stipulation requires a division of orebodies exposed, recognizes the right of Uncle Sam to use the new tunnel in the Beck, and specifies an agreement on extralateral rights to certain points and some minor matters. The Uncle Sam has shipped 15 cars of 30 tons each from a new orebody on the 240-ft. level, in ground not affected by the terms of the stipulation. These 15 cars of ore had a total assay value of $25,000. Two miners lost their lives in the Yankee Con. shaft, February 9. They were riding up in the cage with a load of steel when one of the drills caught between the cage and the wall plate. The sudden checking of the speed threw one man between the cage and the timbers and the other off the cage, so that he fell to the bottom of the shaft. Directors for the stockholders of the Dragon Iron and Governor mines of Tintic district will meet on March 2 to consider a plan for the consolidation of the two properties. They adjoin and can be worked to advantage through the Dragon shaft. The Governor mine is supposed to have the extension of the Iron Blossom vein.

About 400 miners, mostly Greeks, employed at the Kenilworth mine of the Independent Coal & Coke Co., went on a strike, February 4. Different reasons were given for the strike, such as shortage in weights (which the company agreed to meet by allowing the miners to put in a checker), forced trading at the company store, and a desire on the part of the men to drive out all but the Greek miners. Pickets were established who turned back the men, who attempted to work, at the points of guns. The Greeks then took up a position on the out-cropping rocks and opened fire on the town, killing Thomas Jackson, a watchman in the employ of the company. Forty special deputies were rushed to the scene from Salt Lake, and the rioters were routed after two of them had been killed and a half dozen wounded. The troublesome miners have dispersed and the mine is operating at half capacity with those who remained. The Consolidated Fuel Co. and the Castle Valley Coal Co. have filed a petition with the Interstate Commerce Commission asking for a hearing and readjustment of freight rates on coal. These companies come in competition with some owned by the railroads, and they claim discrimination in the supply of cars and freight rates.

The proposal to merge several of the Alta properties may reach a successful termination. The properties have been examined and the terms proposed. The mines included are the South Hecla, City Rocks, Continental Alta, Copper Prince, and Alta Development. The first step toward development will be to drive a drain-tunnel about four miles long, starting near the old Continental Alta mill on Tanner's Flat. This would give good depth on the veins and drain practically the entire camp, besides providing a means of shipping ore during the months when the camp is snowbound. The South Hecla has ore on the Wedge fissure. The stringer, which was only four or five inches wide, has widened to 4 ft., and contains good shipping ore. Lessees on the Columbus Con. are taking out about 20 tons of ore per day, and the company is driving toward the lime contact on the main level. The lower workings are still flooded, as the new pumps have not been installed. At American Fork the Pacific company has discovered that it was sending good ore over the dump, so it started sorting, and some shipments sampled $1000 per car. This was a stockpile which was to have been milled. One carload just shipped netted $46 per ton. The Eudora Belle has ore assaying $80 per ton, which is being sacked and shipped. W. D. Shaughnessy, manager of this mine, died recently. He was a son of one of the pioneer mining men of the State.

Four men were killed in snowslides which occurred in Alta district on January 31. One slide demolished the surface working of the Utah Mines Coalition Co., and killed three miners; another killed one man who was working at a small prospect over the divide from Alta, and a third came down the hill above Alta, but, fortunately, broke on a ledge of rock before it reached the town. Some time will be required before the Utah Mines Coalition can repair damages and resume work. Heavy snows rendered the Alta roads impassable for a few days, but 14 four-horse teams have been engaged in breaking a trail, and ore-hauling has been resumed. The Maxfield mine, which is being operated by the Howell-Johnson Leasing Co., will commence shipping ore this week. The Copper Bank Mining Co. has been organized to develop a group of six claims four miles west of the Maxfield. The recent decision of the Department of the Interior to the effect that a placer location of 160 acres made by eight individuals and assigned to one individual, or a company, is invalid unless location is preceded by actual discovery on each claim, will affect many of the oil locations in this State and throw a large number of claims open to entry. It has been customary to locate and assign as above and work the group on the strength of discovery on one claim, but the Department has held that this is not sufficient. During the month of January the U. S. assay office at Salt Lake bought gold bullion valued at $155,627, and silver bullion worth $2573, an increase of $50,000 over the corresponding month of 1910.

JOHANNESBURG, TRANSVAAL

November Output of Seven Districts.—Increase in Number of Tube-Mills.—The Labor Supply.—Reduced Profits on Rand.

The Mines Department reports that during the month of November the total production of gold in the Transvaal was 641,400 oz., of a value of £2,724,496. Output by districts is given below.

District.	Ounces.	Value.
Witwatersrand	616,844	£2,620,188
Heidelberg	5,100	21,663
Klerksdorp	2,234	9,491
Barberton	6,524	27,715
Pilgrim's Rest	10,356	43,991
Pietersburg	282	1,197
Miscellaneous	59	251

Both Heidelberg and Klerksdorp are districts which are actual extensions of the Witwatersrand banket formation, so it will be seen that were it not for the Witwatersrand and its extensions the Transvaal production of gold would be very insignificant. The total number of crushing mines is given as 97, of which 61 were on the Rand, the other districts contributing with the following number of mines: Heidelberg, 3; Klerksdorp, 5; Owoshoop, 1; Barberton, 13; Pilgrim's Rest, 12; Pietersburg, 2. Since the introduction of tube-mills the increase in the number of stamps has been somewhat checked, the tendency being to increase the stamp-duty by coarse crushing with stamps, and to finish the operation by passing the pulp through tube-mills. As a matter of fact, there are more idle stamps in the Transvaal at present than has been the case for some time, owing to the preference for tube-milling The average number of stamps dropping in the Transvaal during November was 9751, nine less than during October, 9140 of which were on the Rand. Tube-mills, however, increased from 194 in October to 199 in November, of which 188 are on the Rand. The ore milled during November amounted to 1,867,092 tons, as against 1,940,273 tons in October.

With the exception of tin and coal, the Transvaal does not possess many base-mineral prospects, but for November the total value of the base-mineral output, excluding coal, reached £45,225, and comprised the following minerals: Copper ore, £4561; tin ore, £28,356; magnesite, £165; flint, for tube-mills, £2648; lime, £9419. The amount of dynamite issued at the different mines in the Transvaal during November was 2,893,921 lb. No monthly return of the diamond output of the Transvaal is available. Regarding the labor position at the mines, about which so much has been heard, the number of whites employed has increased during the year from 24,653 to 27,441, and of colored from 194,162 to 216,414. Despite this increase, the supply of labor is still far below the requirements of the mines, some having been unable to see their way to declare the usual dividends at the close of the year, preferring to keep the amount in hand in readiness for further labor contingencies.

With the close of the year it becomes possible to compute the dividend earnings of Transvaal mines for 1910, and to compare them with the results secured in the previous year. To summarize the figures, it may be stated that the gold mines of the Witwatersrand have paid out £8,875,085, or £435,666 less than in the preceding twelve months. The gold mines of the outside districts have distributed among shareholders £243,773, which is £49,903 more than in 1909, so that the total dividend record of Transvaal gold mines for 1910 amounts to £9,118,858, or £385,763 less than in the previous year. As regards diamonds, the amount distributed is the same as last year, £180,000. Coal mines, despite the over-competition in the fuel trade and the consequent maintenance of a low price of coal, have bettered their dividend records, the total distributed amounting to £164,914, or an increase of £26,579 for 1910. The increasing growth and prosperity of the Transvaal tin industry is reflected in the declaration of £45,300 in dividends as compared with £19,100 for 1909, an increase of £26,200. The total of mining dividends amounts, therefore, to £9,509,072, or a decline of a third of a million sterling from the previous year's announcement. Over and above this, financial, industrial, and land companies have distributed among shareholders £2,817,268, a large proportion of which was derived directly from the mining companies. Taking into account the money spent on development and equipment out of profits, the dividend results for the past year may be considered satisfactory, especially so in view of the fact that there has been a certain amount of reorganization in the gold-mining industry, mainly in the direction of abolishing the idol of minimum working expenses per ton. The increase in dividends resulting from base-metal mining operations is especially gratifying.

An important amalgamation scheme has been planned for the union of three properties in the Roodepoort district of the West Rand—the Princess Estate, Roodepoort Central Deep, and West Roodepoort Deep. The basis of the proposals is that the Princess Estate company, the most prosperous of the three concerns under consideration, shall absorb the other two companies, and in order to do this the capital shall be increased from £325,000 (£265,000 in issue) to £650,000. Shareholders in the Princess Estate company will receive 265,000 £1 shares; that is, one share in the new company for each old share held. The Roodepoort Central Deep shareholders take £108,333 in £1 shares, which is on the basis of one new share for each three old shares held. As regards the West Roodepoort Deep, where the reef is very thin, although rich, and where the results

Ferreira Deep Mill on the Rand.

of development to date have been on the whole unsatisfactory, £68,160 in shares in the new concern will be issued; that is, one new share for five old shares. For cash capital, 132,700 shares will be issued at 27s. 6d. per share. The shares in reserve free of option will total 74,967, and 840 shares will be issued to the West Roodepoort Deep, Ltd., in part settlement of the company's liabilities. After liquidation of sundry debts and debentures, it is estimated that the new company will have a cash working capital of £99,000. The area controlled will amount to 680 claims, and the amount of ore in reserve at the present day in the three mines is estimated at 647,000 tons, of which 582,000 tons on the South Reef have a value of 8.11 dwt. per ton, and 65,000 tons on the Main Reef average 6.06 dwt. per ton. Crushing operations are to be concentrated at the Roodepoort Central Deep battery, the plant being designed to crush 18,000 tons per month. Development work is to be pushed and the capacity of the mine plants will be enlarged in the near future. Recent profits of the Princess Estate and Roodepoort Central Deep have averaged about £6000 per month, and as a result of the amalgamation of the mines it is estimated that the working profits will be improved by about 3s. per ton. The scheme gives promise of doing much for a district which has so far proved one of the least remunerative and most disappointing in the whole of the Witwatersrand area, and the fortunes of the mines concerned, when operating under the new management, will be watched with great interest.

General Mining News

ALASKA

(Special Correspondence.)—Knik, situated in the Cook Inlet and Susitna region, is on one of the mushing routes to Iditarod. It is also the supply point for a quartz and placer mining country about 30 miles to the north, on Willow creek, Craggy creek, and the headwaters of the Little Susitna. The Brooklyn Development Co. is to install a 3-stamp mill; the Gold Bullion M. Co. is adding 5 stamps to its mill, is building a tramway, and driving an adit-level on a vein containing free-gold ore, some of which yielded $2000 per ton last season; machinery is to be set up on two other properties of that district this season.

Knik, January 20.

Reports sent out from Valdez are to the effect that equipment for 12 stamp-mills is being shipped to that place and that these mills are to be erected in the Valdez district next summer. They are mostly 3-stamp plants, though it is claimed that among them are two or three 10-stamp plants. Among the mines being developed is one on Shoup's bay in which a vein has been opened to a depth of 400 ft. by a series of adit-levels; on the dump is said to be 800 tons of ore of good milling grade. The Big Strike group in that locality has been sold to H. W. Suesseldorf and T. J. Devinney at $35,000, of which $4000 was paid. It is claimed there are 400 men employed in the Valdez district in connection with mining.

ARIZONA

COCHISE COUNTY

The Copper Queen company probably will sink a new shaft to the depth of 2000 ft., the location for which is between Lowell and South Bisbee. The principal use of the proposed shaft will be to obtain better ventilation in the several mines, and to accomplish this a connection will be made at the 1200-ft. station with the Lowell shaft.

GILA COUNTY

(Special Correspondence.)—The station being cut on the eighth level of the Superior & Boston probably will be finished within the next ten days, when a cross-cut will be started westward for the purpose of cutting the Great Eastern vein. It is possible that when opened at this depth the vein will be found to contain the same grade of ore as was mined on the sixth level, shipments of which to the Old Dominion smelter sampled 6% copper. A raise is being cut from the sixth to the eighth level from the west drift, on the Great Eastern vein, and contains iron ore impregnated with bornite and copper glance, and assays from 5 to 7% copper. F. H. Probert, consulting engineer, visited the property recently and expressed himself well satisfied with conditions at the Superior & Boston. The Barney Copper Co., whose property adjoins the Live Oak on the west, has started its second churn-drill hole 300 ft. north and west of hole No. 44 of the Live Oak drillings. Judging from the results of the adjoining Live Oak drill-holes and the topography of the section, it would not seem probable that hole No. 2 of the Barney will strike the ore at less than 700 ft. In drill-hole No. 1 the ore was entered at 500 ft., but hole No. 2 has been started on higher ground. It is now down 100 ft. The report of Pritchett and Hamilton, consulting engineers for the Summit Copper Co., dated January 30, 1911, has just been issued. According to their estimates there is blocked out and on the dump low-grade ore of the value of $793,624, divided as follows: 33,011 tons averaging 4.36% copper; 8578 tons at 6.51%; 17,062 tons at 3%; 39,860 tons, assaying 2%. The Pasquale vein was 12 to 18 in. wide on the 300 ft. level, and where opened on the 400-ft. level had widened to 2 ft., the ore assaying 25 to 30% copper.

Globe, February 11.

MARICOPA COUNTY

(Special Correspondence.)—The 20-stamp mill built last year at the Vulture mine has been in successful operation since September. The ore is crushed in cyanide solution, the amalgamation taking place inside the mortars. The sand is reground in Australian grinding-pans, and the pulp is treated by Dorr's continuous decantation process, in which three pulp-thickeners are used in series. The property belongs to the Vulture Mines Company.

Wickenburg, February 6.

MOHAVE COUNTY

The Bi-Metal mines, situated within 3 miles of Kingman, were recently examined and sampled by James F. Parks of San Francisco. It is understood this sampling is for the purpose of deciding as to the advisability of erecting there a large milling plant. The mineral-bearing ground in the group consists of granite-porphyry and diorite, gold, partly free, being disseminated through it. The test of 100 tons made at the 10-stamp mill on the property last year resulted in a recovery on the plates of $4.92 per ton. According to information obtained some time ago, the property belongs to the Arizona Gold Mines Co., the manager for which is E. M. Lamont, of Colorado.

Bi-Metal Mines and Mill.

PINAL COUNTY

The Magma Copper Co. owns claims covering the Queen fissure-vein at Superior, situated 30 miles north of Florence. This is an east-west vein cutting at right angles the Superior contact. It is close to the old Silver King mine and was discovered at about the same time as the latter. The Magma company's Queen vein is developed from a shaft, cross-cuts having been driven to the orebody from the 300, 400, and 650-ft. stations. The cross-cut at 650 ft. is a recent accomplishment. The ore found on the 300 and 400-ft. levels was phenomenally rich, and it is claimed that the value in copper and silver of the ore being mined on the 650-ft. level is $800 to $1000 per ton. Driving on the vein is progressing both east and west from the cross-cut at the last-named level, and this work shows the vein to be 8 ft. wide.

YAVAPAI COUNTY

The Alta mine, in charge of E. Haney, has a 6-in. stringer of ore, samples of which have assayed 400 oz. silver per ton. There is some copper and antimony associated with it. The property is situated near Iron Springs, and the discovery was made while driving an adit toward a porphyry dike.

YUMA COUNTY

The Big Eye mine, a new property, but little developed, situated in Castle Dome district, has been sold by Amos Adams, W. C. Prewitt, L. W. Schooler, P. O. Spitter, and J. L. Huffman to H. V. Ketchersides, T. S. Overholtzer, Thos. Finch, and others at $160,000. H. C. Johnson, who held an interest with the original owners, retains such inter-

est. The title to the mine is vested in the Big Eye M. Co. An adit is being driven, and future development is to be facilitated by installing a hoisting-engine, an air-compressor, and drills. Castle Dome camp is situated about 45 miles northeast of Yuma. The Dunkirk mine, situated in Whipple mountain, and controlled by Santa Fé railroad men, is yielding gold ore of high grade. A fight between a stubborn hog and combative dog led to the discovery.

CALIFORNIA

AMADOR COUNTY

The South Eureka M. Co., which is paying 3c. per share in dividends, has 60 stamps in operation on a fair grade of ore. C. P. Vicini, while driving an adit on the east side of Butte mountain, opened a channel of material containing free gold in coarse particles. The discovery was made at a place high on the mountain-side where no mining had been done previous to this. J. S. Garbarini and others have a lease on a copper property situated on the Johnson ranch, 3 miles west of Jackson. They have sunk a 100-ft. shaft, and have copper ore of good grade, which contains some gold. The Central Eureka mine, with 20 stamps operating in the mill, yielded $13,500 in December, and $14,500 in January.

ELDORADO COUNTY

The Landecker gravel property, now called the Hope, embraces an area of 412 acres at Placerville, has three placer channels, and has been developed by 2000 ft. of adits. The equipment consists of an air-compressor, driven by water-pressure, three air-drills, cars, and trackage. It is estimated that a sufficient tonnage of gold-bearing gravel has been blocked out to keep the mill operating six months. The operators mine and mill not only the channel gravel, but they take out and mill about 3 ft. of the bedrock, all the material yielding about $5 per ton. The property was taken into possession January 1 by the Hope M. Co. The Mother Lode Mines Co., of New York, has a bond on the Kelsey mine, situated four miles north of Placerville, which is to be prospected and developed this season. The property covers a mile on the Mother Lode, where there are numerous croppings of quartz. W. A. Hooten, the company's representative, is proceeding with the work outlined and may install some machinery later.

INYO COUNTY

The Keane-Wonder mine, situated on the west slope of Funeral range, facing Death valley, is producing 60 to 70 tons of ore per day, and this is being treated at the Keane-Wonder mill, the clean-up of free gold amounting to close to $20,000 per month. Rhyolite, Nevada, is the supply town for this mine, the distance between the two places being about 20 miles.

KERN COUNTY

The Arondo mine, situated in the Argus range, is being operated now with a force of 20 men, under direction of J. K. Miller. A supply of ore has been accumulated, and the mill is soon to be in operation, the water for mill-work being delivered from a distant source through a line of pipes. The mill, equipped with a crusher, rolls, and facilities for cyanidation, is to be increased in capacity; the force of miners and millmen is to be doubled. The lease of the Butte mine, at Randsburg, to Ed. Shipsey took effect February 1. The lessee is performing some preliminary work prior to commencing regular mining operations. The shaft is being straightened, ladderways are being built, and in the stopes the ground is being caught up and timbered. The shaft is to be sunk till a depth of 150 ft. shall have been reached, and levels are to be driven from the 100 and 150-ft. stations. The Rice lease expired on February 1, at which date the lessee made a clean-up of $6000 from 40 tons of ore that was treated at the custom mill of the Stanford M. & R. Co. at Johannesburg. It is said that a number of sub-leases are to be let on the Butte mine. Jas. Rice has taken over the Zachry lease on the King Solomon mine.

NEVADA COUNTY

Buck Bros., owners of the German Bar mine, drove an adit-level some distance on the vein, from which rich ore was taken, but they reached a point where the vein faulted, and recent efforts have been for the purpose of finding the vein in its faulted position. E. M. Parish has a bond on the Gold Canyon property, on which there is a force of men working under direction of O. D. Woodman. At the Plumbago mine the usual number of miners is engaged, with C. W. McMeken in charge. This mine has an orebody from which ore of good grade is being taken. The Delhi mine, farther down-stream on the middle Yuba, has water-power for all purposes. The water has been pumped out of the workings, a shaft is being sunk, and other mining operations are in progress.

The project of driving a deep adit from a site on Rush creek, near Jones bar, in Nevada City-Grass Valley district, is being considered. A plan for accomplishing this was outlined by Geo. W. Downey a few years ago. A bore, starting at the place proposed, would give a depth at several mines of about 1400 ft., and if it were driven as far as the Champion mine it would have a length of 11,000 ft. The possible discovery of new veins of ore is one of the strong incentives to carrying out the project. The Gaston mine is operating, and the mill is running at part capacity. Repairs are being made on the supply ditch by which water is brought to the mill.

PLACER COUNTY

The Pioneer mine and mill, situated in Humbug canyon, near Alta, are to be operated again under direction of Jack Patrick and Harry Morris. The Pioneer was operated profitably in early days.

RIVERSIDE COUNTY

The Riverside Gold M. & M. Co., having 10 claims on Riverside mountain, close to the Colorado river, has been developing there two years, and recently it opened a vein of copper-gold ore by driving a cross-cut. This was followed by driving on the vein, the face of the drift being in ore having a width of 5 ft.; and the grade is such as will justify the expense of mining and shipping. In addition to this, there is said to be 4 ft. of ore of milling grade. This district is within practicable hauling distance of the Parker branch of the Santa Fé railroad.

SHASTA COUNTY

Gould & Burg, of Contra Costa county, have been engaged by the Shasta County Farmers' Association to make analytical investigations as to the character of the fume being emitted from the stack of the smelter at Coram. The Balaklala Con. Copper Co., in 11 months of 1910, produced 9,666,595 lb. of copper, 446,135 oz. silver, and 10,310 oz. gold. The Heroult electric iron-smelter is operating, and is turning out 15 to 20 tons per day of pig iron at a cost of $14 per ton. It is stated that an ample voltage of electricity is now available for use. The plan is to erect five more furnaces. The mines of iron and chrome ores have been well developed.

SIERRA COUNTY

A small force is employed this winter at the Golden Scepter mine, near Bunker Hill. Profitable gold-bearing gravel has been made accessible by sinking a 40-ft. incline. This stuff yields at least $2.50 per mine-car. In the spring a larger force is to be employed. The property is owned by M. A. Cutten, B. M. Atkinson, and others, of San Francisco. The Brown Bear gravel mine, on St. Charles hill, is being operated by those holding it under bond. The ore-channel has been opened. A 600-ft. adit has been driven, the face of which is in pipe-clay and gravel, and the ore deposit is believed to be close by. The property, situated near Downieville, is owned by H. S. Tibbey, August Costa, D. Burgess, and F. P. Roddy; the work is in charge of J. H. Schofield. The Sierra Buttes and Phoenix mines were closed down last week by reason of the flumes being crushed by heavy snow. It is also reported that the mill and other buildings of the Keystone mine have been partly destroyed in a similar manner. The powder magazine at the Bullion mine, in which was two tons of powder, was carried down the hill by a snowslide, but it was not demolished.

TUOLUMNE COUNTY

(Special Correspondence.)—Encouraged by the recent finding of a body of good-grade ore in the lowest level of the Black Oak mine, the management of that property may sink an additional 100 ft. The Spring Gulch mine, bonded to W. B. McCubbin and George Ash, is being unwatered, preparatory to beginning mining operations. The shaft is 600 ft. deep and the vein from 4 to 10 ft. wide. Twenty more stamps have been ordered for the Tarantula mill and will be installed as soon as they are received, making 40 in all. It is said this may soon be followed by another addition to the plant, the intention being to ultimately have a 100-stamp mill. A shaft will be sunk at the Jumper which will be connected with a raise 200 ft. below surface. Thus, a suspension of mining operations while straightening and enlarging the present working shaft will be obviated. Work is to be commenced at the property of the Dugan-Dodsworth Mining Co., near Jamestown. Large orebodies have been opened on the Heslep vein at the App. This new source of ore supply enhances the value of the mine, the outlook at which is better now than in many years. J. H. Alling, representing Chicago investors, has secured a bond on the Rough and Ready gravel mine. The instrument calls for the commencement of work within 60 days, and it has been decided to drive an adit approximately 400 ft. to properly open the gravel deposits. Mining operations will soon be commenced on a 40-acre tract on Woods creek, midway between Sonora and Jamestown, believed to contain gold in gravel deposits. A Pittsburg company has taken a bond on the Hunter and Hardtack mines, on Hunter creek, and it is understood operations will soon be in progress. The Sure-Shot claim, in the Basin district, owned by G. B. Connally, gives promise of becoming a producer. The vein is 10 ft. wide and assays of the ore average $7 per ton.

Tuolumne, February 12.

YUBA COUNTY

The Summit Hill M. Co. has been incorporated by F. B. Bininger, J. G. Ramm, Wm. Herlitz, R. C. Elge, and K. H. Ellis, to develop and mine ore on a property close to the Dobbins ranch.

COLORADO

The State legislature has enacted into law what was introduced as the Hurd eight-hour bill, bringing under its provisions all classes of employment in mines, smelters, reduction plants, and cement mills.

CLEAR CREEK COUNTY

The January ore-shipments from the mines of this county amounted to 128 cars, which is 18 cars in excess of shipments for January 1909. The concentrating plants are crowded with ore, and there is every indication that the mining industry is in a prosperous condition. Two of the big mines of the county are the Saratoga, at East Argentine, above Georgetown, and the Donaldson, in Trail Run district, both controlled by the North American Smelter & Mines Co., operator and owner of the Golden smelter. The Donaldson orebody has been opened to a depth of 1500 ft., samples of the ore assaying about $45 per ton. The development has been accomplished under the direction of J. H. Robeson. The property is entered through the Rockford adit, and shipments of ore to the smelter amount to nearly 1000 tons per month. Shipments being sent out from the Santiago are restricted to the tonnage that can be hauled to Georgetown, but they are to be increased as soon as the East Argentine railroad can be kept open for traffic. The greater number of the mills of the county are situated at Idaho Springs, where much of the ore of this county and considerable of the Gilpin county ores are treated.

GILPIN COUNTY

The facilities for deep drainage, thorough ventilation, and modern milling in Gilpin county is making it practicable to mine ore averaging as low as $6 per ton. The drainage of the Quartz hill mines through the Newhouse tunnel, is resulting in the opening of bodies of ore to depths of 1200 to 1500 ft. The Gunnell mine is being drained by making a raise from the Newhouse tunnel to connect with a winze which was sunk from its lowest level.

LAKE COUNTY

The Nevada mine, east of the Ibex, on Breece hill, under lease to Thos. Simpson and associates, has been unwatered down to a point below levels formerly worked. In mining rich lead and gold ore in the higher workings, it was found that the orebody dipped on a steep incline, making it necessary to get at the ore on the lower levels which were then under water. One of the formerly submerged levels was found to have been partly filled by caved ground. The débris is being cleared away, and mining will soon begin there. The Kankakee tunnel has been driven 2000 ft., and it is expected to be driven on to the London fault. The portal is at Linderman, in Birds-Eye gulch. The work is in charge of Joseph Franks of Denver. A box containing 35 lb. of blasting powder exploded at the Garbutt mine, Breece hill, wrecking the ore-bins, the damage amounting to $2500. The explosion resulted from some mistake in

Map of Colorado.

connection with thawing. The thawed powder caught fire, the fume of which served as a warning to the men at the plant, enabling them to escape only a minute before the explosion occurred. F. C. Dinsmore, S. H. Alexander, W. W. Theobold, and A. O. King are principally interested in the Garbutt. The Cofield lease, on the Little Johnny group, recently produced a car of ore that sampled 15 oz. gold per ton at the smelter; in addition to this, 33 lb. of gold ore yielded $130 per pound at T. D. Kyle's melting furnace.

SAN JUAN COUNTY

The Slide mine, owned by W. E. Porter of Denver, and leased to L. Lowe and John Yeager, has a new body of ore containing argentite and free gold. The pay-ore has a width of 10 to 16 in., and assays about $100 per ton. The property is in Galena basin. The big mill of the Gold King company is to be started again in a few weeks. Its location is at Gladstone, on Cement creek.

SUMMIT COUNTY

The King Solomon tunnel, being driven near Frisco, in Ten-Mile district, has a length of 4900 ft. and has intersected 11 veins in that distance. Considerable driving has been done in ore on several of these veins. Samples of ore taken from vein No. 2 assayed over $300 per ton; ore taken from a 50-ft. winze assayed 120 oz. gold. While veins No. 7 and 10 have good ore, that in vein No. 11, which was opened at a depth of 1800 ft., is mostly steel galena, accompanied by gold, silver, and copper, and is exceptionally high grade. Most of the development and blocking-out of ore is being confined to this vein, and a considerable tonnage is to be shipped next spring.

TELLER COUNTY

The Cripple Creek mines produced 71,105 tons of ore in January, of an estimated value of $1,326,117. Of this output, only 4250 tons was smelted. The 66,855 tons treated at the various milling plants were distributed as follows:

Plants.	Tons.	Av. per ton.	Value.
U. S. R. & R.	14,000	$22.00	$308,000
Golden Cycle	23,850	20.00	477,000
Portland	10,000	20.00	200,000
Portland, C. C.	9,005	3.40	30,617
Stratton's Independence	9,000	3.25	29,250
Wild Horse	1,000	5.00	5,000

The ore shipped to the smelters had an average value of $65 per ton. The mills treating the higher-grade ore are situated in the valley; the last three named, treating the low-grade ore, are at their respective mines in the district. For the same month the Portland paid $60,000 in dividends; the Vindicator, $45,000; Golden Cycle, $30,000; Acacia, $7200. The operations of the Trilby Mines Co. were stopped by order of the State Commissioner of Mines, who enjoined the company from further operations until dump cribbing was repaired and made safe. The company complied promptly. M. B. Rapp, a lessee on Dante No. 2, Bull hill, is mining ore from a 4-ft. vein, 11 in. of which is high grade. Selected ore recently shipped sampled several hundred dollars per ton. His operations are between the third and fourth levels. H. D. Gortner shipped a carload of ore from the Mollie Kathleen, Tenderfoot hill, which sampled $14 per ton. The Consolidated Gold Fields of South Africa, Ltd., has purchased the Golden Cycle mine, at Cripple Creek, and the Golden Cycle mill, at Colorado City.

IDAHO

For 11 months of 1910, January to November, inclusive, there was received at the U. S. assay office, Boise, 25,139.58 oz. gold, and 15,751.47 oz. silver, mine operators of 21 counties contributing to make up these results. These figures, however, are not given as a representation of the output of gold and silver of the State, as some of the bullion produced was sent to Seattle and Salt Lake, and not any part of the silver recovered from lead ores appears in the figures of the Government assayers.

BLAINE COUNTY

Hamilton Swift, A. Farnlun, and R. Leach, who purchased the property containing the Moonlight lode, have discovered a body of ore at 25-ft. depth, a ton of it containing a high percentage of lead and several hundred ounces silver. An adit is to be driven to open the ore at 250-ft. depth. The property is eight miles from Ketchum. The Relief and Minnie Moore mines, situated at Bellevue, and belonging to the Idaho Con. Mines Co., have extensive bodies of concentrating ore, which are well developed. It is said that a reorganization of the company is in progress. The Idaho Democrat mine is to be equipped with a hydro-electric plant. Lessees are to resume work on the Red Elephant mine. There is 500 tons of concentrate at the Boulder mine ready to be hauled to Hailey for shipment. Reports indicate that Wood River district mines will be more active than usual this year.

IDAHO COUNTY

The Northern Idaho Gold M. Co., made up of Minnesota men, has made the final payment for the Gilt Edge group of claims in Ten-Mile district, on which it has been operating under a bond for the last 18 months. The vendors were A. D. Bennett and John Grindi, and the price was $25,000. The Seventeen property, in the same district, which has been worked under a bond during the past year by Nathan Haas, has been taken over by him on the final payment of the agreed price. The former owner is W. B. Houston.

The Jumbo mine and mill, in Buffalo Hump region, are being operated by H. E. Gray and partners, as lessees, who are mining ore fast enough to keep two 5-stamp batteries in operation. They are having a raise made from No. 4 to No. 3 level, a distance of 380 ft. Much of the ore being milled is mined on a shoot opened by an intermediate, between levels No. 2 and 3. No. 4 is the mill-level, and on this a great deal of development is to be done. The supply town for this district is Grangeville.

LEMHI COUNTY

The Latest Out mine, situated at Gilmore, ranks second among the shipping mines of this county. Since the Gilmore & Pittsburg Railway Co. began operating trains, six months ago, the ore shipments from this mine have amounted to 3700 tons. It is claimed there are 9000 tons of ore in the mine ready to be broken, and development extends to a depth of only 365 ft. The ore being shipped samples 33% lead, 17 oz. silver, and 50 to 90c. in gold per ton. The mine is 1½ miles from the railroad, making wagon haulage of that distance necessary. R. Nicholls is at the head of the company that controls the mine.

OWYHE COUNTY

The Gray Eagle & Silver City M. Co. has been organized at Caldwell to develop two mineral lodes on West Sinker creek, four miles north of Silver City. Some work has been performed, and the ore obtained assays high in gold and silver.

SHOSHONE COUNTY

(Special Correspondence.)—Reports of a favorable character are received from Heinze's Stewart mine at Kellogg. In a short time the output of milling ore is to be increased to 450 tons per day, and in addition to this, first-class ore shipments will be made to the East Helena smelter. With an output now running 350 tons per day it is stated that the mine is earning about $20,000 per month net. There is a debt of $125,000 on the property, and it is stated that this will be paid off inside of six months from earnings which it is estimated will reach at least $30,000 per month by April 1.

Wallace, February 11.

MONTANA

DEER LODGE COUNTY

(Special Correspondence.)—A company is being organized by persons of Butte and the East for the purpose of constructing an electric railway for hauling ore from Georgetown district to Anaconda. In this district is located the Southern Cross, Cable, Oro Fino, and other mines. The Southern Cross company is employing 75 men and is shipping its ore to the Washoe smelter, necessitating a wagon-haulage of 12 miles. The parties who are principally interested in the electric road are the owners of the Bonanza mine in which rich ore was recently discovered. The line has already been surveyed, and it is stated that sufficient capital has been subscribed to ensure its construction. It looks as though there would be much activity in this district.

Anaconda, February 11.

NEVADA

NYE COUNTY

The Goldfield Consolidated company, on February 14, shipped to the Selby Smelting & Lead Co., San Francisco, 19 bars of bullion, weighing 1480 lb., valued at $426,000. It was sent by Wells, Fargo & Co. express under guard.

STOREY COUNTY

Recent development in the Mexican mine, at Virginia City, is of importance. The north drift on the 2500-ft. level, from the east cross-cut, opened ore, 15 mine-cars of which assayed $44.50 per ton. The driving is entirely in ore. The north drift has been extended 460 ft. The discovery of ore on this level demonstrates the existence of orebodies in the northern part of the mine. It is considered the best showing of ore made in recent years in this mine. The north-end mines produced, for the week ended February 4, ore of the value of $16,222, distributed as follows: Ophir, $7407; Con. Virginia, $2501; Mexican, $6313. The Ophir product was 340 mine-cars, averaging $21.78 per ton; the Con. Virginia produced 237 mine-cars averaging $10.25 per ton; the 108 cars taken from the 2500-ft. level of the Mexican sampled $58.46. The vein in the Mexican, where the recent discovery was made,

has a width of 10 ft. The joint winze, being sunk from the 2000-ft. level for the Union and Sierra Nevada, has reached a depth of 85 ft. Work continues on the south drift of the 2000-ft. level of the Ward shaft. Similar work is in progress on the 2250 and 2450-ft. levels at the Ward. At the Yellow Jacket mill there was crushed 715 tons of ore for the week, 431 tons having been supplied by the Crown Point, and 284 tons by the Belcher mine. Of the Crown Point ore, 378 mine-cars assayed $3.27, and 549 cars assayed $8.05; and of the Belcher ore, 171 cars averaged $9.35, and 99 cars ran $6 per ton. Storey county mines, from October 1, 1909, to September 30, 1910, produced 129,225 tons of ore of an assay-value of $451,784.37. Of this amount, the Ophir yielded $220,418; the Yellow Jacket's output was $56,476; that of Con. Virginia was $53,885; Crown Point, $49,032; the Butters company, $44,209; Belcher, $19,293; Hale & Norcross, $12,091; Savage, $1700; Silver Hill, $3453; Comstock-Phoenix, $1050; Mexican figures are not given. The output for the year 1910 would be considerably greater than for the year ended September 30, as there was a substantial increase during the last quarter of the year. Dietrich & Hahnewald Bros., having a one-year lease on the Butters concentrator and cyanide plant, have 100 men employed at the mill, and on the Chollar & Potosi and Hale & Norcross mines on which they have leases.

NEW MEXICO

SOCORRO COUNTY

(Special Correspondence.)—At the Socorro mines the east and west drifts have been advanced 1000 ft. on the orebody at the 600-ft. level, with good ore at both faces. This is the deepest development on the vein, and all ore broken is milled. The width of the vein varies from 5 to 20 ft. The same vein will be cut on the 700-ft. level within the next month. During January, 26,000 oz. of gold and silver bullion was produced and shipped. The Ernestine M. Co. opened its western orebody at 700-ft. depth several weeks ago by driving the main adit. The ore in this vein assays $15 to $20 per ton. The eleventh level has been driven west into No. 3 orebody. These two recent developments have resulted in adding greatly to the ore reserves. The extraction from 692 tons of ore milled during the week was 8474 oz. gold and silver bullion and 45 sacks of concentrate. The mill at the Deadwood mines crushed 250 tons of ore during the first week of its operation. The Treasure M. & R. Co. employs the fill-stope method in mining on its big orebody. Air-drills have been ordered for development work. An Oliver filter has been installed in the mill. Power for all purposes is supplied by the company's hydro-electric plant. The Enterprise M. Co. has sacked and shipped some high-grade ore to the smelter.

Mogollon, February 12.

CANADA

BRITISH COLUMBIA

(Special Correspondence.)—The shipments of blister copper from the Granby smelter for the week ended February 4, amounted to 440,000 lb., which exceeded all previous records. The Granby copper output for 1910 was 20,018,048 lb.; of silver, 355,997 oz.; gold, 44,130 oz. The gross proceeds of these metals at average prices would be about $3,635,191. The work being done by the Granby company at the Hidden Creek mines, according to O. B. Smith, superintendent, is promising. Five thousand feet of diamond-drill core has been taken out of the holes since November 15.

Phoenix, February 10.

(Special Correspondence.)—During the first six months of the current fiscal year the Consolidated smelter at Trail produced metals of the value of $2,294,000, which is a satisfactory increase over that of previous years. Over 35,000 tons of ore per month is being treated at this plant, the gross output per month averaging $351,000, of which about 53% is gold.

Rossland, February 9.

Technical Schools and Societies

C. K. Leith lectured recently at Northwestern University, comparing the geology of the Lake Superior, Brazilian, and Cuban iron ore districts.

The University of Illinois has issued, from its Engineering Experiment Station, bulletin No. 43, on 'Freight Train Resistance, Its Relation to Car Weight,' by Edward C. Schmidt.

Robert H. Richards has recently returned to Boston from New York and Pennsylvania. He also made a visit to the John Hays Hammond Laboratory at the Sheffield Scientific School, New Haven, Connecticut.

A. P. Merrill delivered an address on 'Some Important Considerations in the Design of Hydro-Electric Power Plants' at one of the recent monthly meetings of the Utah Society of Engineers, held at Salt Lake.

The Board of Geological Survey of the State of Washington has issued its biennial report for the years 1909-10. It has issued numerous bulletins relating to the geology of coal and metalliferous regions; also a topographical map of the State.

The Lewis Institute, Chicago, opened its Winter Quarter January 3. An evening course in gas-engines is being given. There are 2700 students registered. The course includes mechanical, steam, and electrical engineering, drawing, shopwork, and chemistry.

The Montana Society of Engineers held its twenty-fourth annual meeting at Helena January 12 to 14. The members visited the smelting plant at East Helena, and the Hauser Lake dam. There were 26 members in attendance. F. W. C. Whyte was chosen president; Clinton H. Moore, secretary; Samuel Baker, Jr., treasurer and member of board of managers. W. L. Miller talked on the construction of the Hauser Lake dam; C. W. Goodale told of his visit to the Panama Canal.

Directors of the American Mining Congress met in Salt Lake last month. The number of members comprising the board was increased from 9 to 13, of which 5 are to constitute a working quorum. The executive committee, acting on authority of the other members, appointed Geo. W. E. Dorsey, of Nebraska, James Douglas of New York, and B. F. Bush of Philadelphia, to serve as three additional directors till the next session of the Congress; the selection of the fourth member was deferred till the place for holding the next annual meeting shall be chosen, when a resident of that locality will be appointed, and this is to be decided upon about March 1. The board of directors, as now constituted, consists of the following members: John Dern, Salt Lake; E. R. Buckley, Rolla, Mo.; D. W. Brunton, Denver; E. A. Montgomery, Los Angeles; A. G. Brownlee, Denver; Samuel A. Taylor, Pittsburg; L. W. Powell, Warren, Arizona; Geo. Wingfield, Reno; Chas. A. Barlow, Bakersfield; Geo. W. E. Dorsey, Nebraska; James Douglas, New York; B. F. Bush, Philadelphia.

Mine-rescue work and first-aid practice are to become a part of the course at the Colorado School of Mines, and each year this school is to co-operate with the U. S. Bureau of Mines in affording members of the senior class special practice in this line of work. One of the Rescue Cars of the Bureau of Mines, detailed for service in Colorado, was at Golden a week in charge of J. C. Roberts, assisted by Thomas Tweeddale and Thomas Harvey, who with A. J. Hoskin and A. C. Smith, professors in the School of Mines, divided the class into squads of seven, assigned special duties to each squad, and gave each student practice in the use of the Drager oxygen helmet under conditions requiring severe physical exertion in an atmosphere of noxious gases. The climbing of hills while wearing these helmets was practised. The students also worked in the School of Mines tunnel, which was filled with gases, such as might be found in coal mines in cases of explosions or fires. There was practice on assumed victims of poisonous gases, suffocation, and drowning, as well as in reviving persons injured from any probable cause.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

WILL CLARK is in San Francisco.

LEE FRASER has gone to Lima, Peru.

W. H. ALDRIDGE was in San Francisco.

HOWARD D. SMITH is at Sonora, California.

S. H. BALL has been at Lexington, Kentucky.

CHARLES JANIN is at Grass Valley, California.

COURTENAY DE KALB has been in San Francisco.

J. H. RICHARDS was in San Francisco Wednesday.

O. H. PACKER has returned from Butte county, California.

RALPH ARNOLD has been visiting the California dredging fields.

A. E. ROBINSON has been appointed State Engineer for Idaho.

E. M. HAMILTON is at the Dolores mine, Madera, Chihuahua, Mexico.

GEORGE A. TWEEDY is now general manager at Minas del Tajo, Rosario, Mexico.

F. OSKAR MARTIN is making examinations in the Panoche and Coalinga oilfields.

H. B. KAEDING has gone to Nicaragua to take charge of the Siempre Viva mine.

J. P. HUTCHINS and NORMAN C. STINES are at the Polefskoy Syssert Estate, Perm, Russia.

HUGO WACHENFELD is in San Francisco, having been visiting American metallurgical plants.

M. S. GRIFFITHS is general manager for the O. y T. Braniff company at Doctor, Queretaro, Mexico.

F. L. RANSOME, having examined the Ray and Miami mines, is about to return to Washington, D. C.

V. B. SHERROD, for several years mill superintendent for the Real del Monte company, Pachuca, Hidalgo, has resigned.

FRANKLIN W. SMITH, consulting engineer for the Alvarado M. & M. Co., is at the company's mine at Parral, Chihuahua.

ALEXANDER P. ROGERS has left New York on a professional trip to Brazil, South America, to be gone several months.

E. H. BARTON, superintendent for the Frisco Mines & Power Co., Mohave county, Arizona, has resigned and is succeeded by Howard W. Squires.

HENRY M. LANCASTER, for several years at Wallace, Idaho, has moved his office to Spokane, where he will engage in a general practice in mining engineering.

ROBERT H. RICHARDS has recently returned from a professional visit to Joplin, Missouri, where he went to look into the operation of his jigs and classifiers.

F. O. SMOLT, formerly from Colorado, and later at Velardeña, Mexico, has gone to Manila, P. I., as representative of the Dearborn Drug & Chemical Company.

BENJAMIN RICHARDS, who has been with the La Rose and Cobalt Lake mining companies for the last four years, is now superintendent at the Hollinger mine, Porcupine, Ontario.

OBITUARY

CHARLES F. SHELBY was killed in an automobile accident near Ancon, Peru, on January 26, 1911. The deceased was for two years superintendent of the Old Dominion smelter, at Globe, Arizona, that plant, as it now stands, having been built under his direction. He held a similar position with the Greene-Cananea Copper Co. for a year, and went to Peru to take charge of Cerro de Pasco plant at Ancon. He was widely recognized as an engineer of great ability and his loss will be keenly felt.

TABLE OF CONTENTS

EDITORIAL

QUEBEC will entertain the Canadian Mining Institute next week and an interesting and profitable session is assured. Mr. Frank D. Adams will preside.

SIX young ladies from Boston have taken a lease on the Lucky Gus mine at Cripple Creek. Boston young ladies are known to be thorough, and the ones in question show their determination to get at the roots of mining matters by following them underground.

RECLAMATION of the great interior valley of California is proposed in a bill introduced at Sacramento, the first step being the preparation of adequate plans. Regulation of the Sacramento and San Joaquin rivers is recognized as one of the great engineering problems of California. The bills under discussion were prepared by Mr. A. D. Foote and should be endorsed by engineers generally.

CARD systems of employing men have been adopted in various Western districts where operators have had trouble with the Western Federation of Labor. In Colorado a bill has been introduced in the Legislature prohibiting the system. It is not likely to pass. While the card system lodges power in the labor secretary that makes grave abuses possible, it was devised to escape even more serious difficulties.

BUREAU OF MINES employees, when injured while engaged in hazardous work, are to be given proper compensation, if the bill now before the Senate at Washington becomes a law. It has already passed the House. The simple justice of the proposal is sufficient argument for it. Under the old system none but soldiers and sailors were compensated for injury. Extension of the principle to cover other Government employees is a belated recognition of the fact that civil service is as important as military, as it is often as hazardous.

COPPER MERGERS have been much discussed in the public prints for a year or more. We present this week an informing article on the subject, written by Mr. Horace J. Stevens, the veteran authority on all things relating to copper. Incidentally, we note that Mr. M. E. Clapp has introduced into the United States Senate a resolution directing the Attorney General to investigate the relations of the Amalgamated Copper Company, Anaconda Copper Company, United States Metal Selling Company, and allied corporations, to determine whether the Sherman anti-trust law is being violated. Here impends publicity with a vengeance!

CANADIAN geologists have selected a strong local committee to arrange for the meeting of the International Geological Congress at Toronto in 1913. Mr. F. D. Adams is chairman, and Mr. R. W. Brock, secretary. An international inquiry on the subject of the 'Fracture System of the Earth's Crust' will be made and probably an inventory of the world's coal resources will be compiled, supplementing the excellent study of the iron resources of the world that signalized the 1910 meeting at Stockholm.

INVESTORS at Vancouver, British Columbia, especially, are being invited to buy stock in the Montana Mammoth Mining Company, which has a silver-lead "orebody" that "runs a mile through the company's ground" and "ranges in width from 300 to 350 feet." This is quite too good to be true. The consulting geologist and mining engineer for the company, Mr. Samuel Aughey, who "is recognized as the leading expert mining engineer, metallurgist, and geologist in the country," has, unfortunately an unsavory record in connection with Arkansas gold discoveries.

ELY CENTRAL reorganization is under way and a stock and bondholders' committee consisting of Messrs. H. E. Lodge, Harry L. Ayer, and J. C. Guggenheimer is soliciting deposit of securities with the Federal Trust Company. Each stockholder is asked to contribute fifteen cents per share toward a fund of $240,000 which, it is estimated, will cover the cost of reorganization. A new company is to be formed and the old stock exchanged for new. In the meantime, the receivers' petition for authority to sell fifty acres of the Ely Central ground to Nevada Consolidated has been denied, but the court is insisting upon payment of debts within thirty days.

TUNNEL-DRIVING records are at best unstable things. In April 1910 the south portal of the Elizabeth tunnel on the Los Angeles aqueduct was driven 604 feet in a hard schist. In January 1911 the Laramie-Poudre in Colorado was advanced 609 feet in hard granite at one heading. Mr. D. W. Brunton, Mr. James A. McIlwee, and their assistants therefore now hold the American record for hard-rock work. European standards are still ahead of us, but the Laramie tunnel is not yet completed. Mr. McIlwee acquired his training in the Arlberg tunnel and came to America to act as foreman at the Cowenhoven tunnel when Mr. Brunton was putting through that important piece of work at Aspen. He and Mr. Brunton have hopes of surpassing the January record in March. In February the breast of the tunnel has been in shattered rock with clay-filled fissures, where progress is necessarily slow.

ALASKA'S greatest gold mine, the Treadwell, is widely known. There is, none the less, much still to be learned from the interesting deposit on Douglas Island that has forced new standards of economical work. We present this week the first part of a discussion of the geology of the mines, written by Mr. Oscar H. Hershey, who has recently completed a systematic investigation of the lode. It is the most important paper on the subject that has appeared since the United States Geological Survey published Mr. A. C. Spencer's report. It is, furthermore, an excellent example of the accurate scientific work that the large mining companies now find economical. Mr. Hershey has necessarily condensed his discussion until only his main conclusions and the reasons back of them appear. He finds that the grade of the ore was relatively high from the surface to 220 feet in depth, decreased between that and 440, and then rose irregularly until the lowest fully developed level, at 1450 feet, is the best in the mine. This result, because it is based on large workings and many samples, is extremely significant as to persistence of values in depth in gold-quartz veins.

Smelter Smoke Legislation

It can not be denied that fashions are powerful in America. The public seldom allows prosaic considerations of reason and sound common sense to interfere with an enthusiastic abandonment to whatever may happen to be the whim of the moment. The feminine members of the community, for example, can scarcely justify clothing themselves with hats too wide to pass through doors and in skirts too scant for convenience, by any argument based on reason and common sense. In the matter of feminine dress we are disposed to concede a great deal of latitude, but an extension of the logic of unreason to business life must be viewed with concern.

For some years past it has been the fashion to make a good deal of commotion over the fumes that escape from smelters. So much is this true even now that smelter managers scarcely hope to remain free from disturbance for more than brief periods at a time. In some cases large smelting plants have been abandoned and the industry moved to other localities, while the managers of plants still in operation sleep with uneasy heads. This matter derives fresh interest by the introduction into the California Legislature of an act to regulate smelters. The act is framed in such a drastic way that not only smelters but acid works and chemical manufactories will be unable to comply with its terms. That is, business interests aggregating $60,000,000 to $70,000,000 yearly will be obliged either to find another field for operation, or else carry on operations under such restrictions that it would be better to cease altogether. When we remember what efforts have been made to secure for San Francisco the Exposition of 1915 in order that a corresponding amount of business may be brought here for one year, it would seem as though restricting such an industry should call for careful consideration rather than unwise zeal. Spencer has said that the proper philosophy of life is an adherence to enlightened self-interest. In this case there seems to be involved too much self-interest and too little enlightenment to produce the best results. We will, with what measure of enlightenment we possess, endeavor to state the matter briefly.

It is acknowledged that smelters produce disagreeable smells. So do tanneries, oil-works, breweries, glue factories, and a host of other industries. The

smell is, however, borne with because these are necessary forms of business, and we should be at a loss without them. Automobiles give off disagreeable odors, but no one seriously objects to their use on that score. The effects of smells from factories are minimized by erecting the works at points where, so far as can be foreseen, there is little likelihood of the immediate neighborhood developing into an important residence or agricultural district. This is not always easy, for where many workmen are employed it is desirable to build homes for them nearby, and where many people live, it is necessary to have a food supply. In the case of smelters where an isolated position is impossible, the next best step is to take such means to prevent annoyance and injury resulting from the fumes as is economically possible. After that the problem resolves itself into whether we shall continue to have smelters operating under reasonable restrictions or no smelters at all. The question, then, is whether the present restrictions under which smelters are now operating are all that are reasonable, or are we prepared to have no smelters.

In the past few years many hearings have been held and much evidence adduced as to whether smelter fume has been the cause of any great damage or annoyance. The two principal elements of danger in the fume from smelters are the solid particles or dust, and the SO_3 gas. It has been shown that in certain cases where animals have eaten vegetation on which dust containing arsenic or lead had settled, death has resulted. Possibly the total value of all the animals that have died from this cause since the beginning of smelting operations in the United States would equal, for example, the value of the product of three hours operation of the Selby works near San Francisco. In response, however, to the representations of those injured in this way means have been introduced at practically every smelter in the United States to remove all dust from the smelter fume before allowing it to escape into the air. The means for this purpose are so effective in their action that further complaint can scarcely be made on this score, and the smelters are, in addition, willing to pay damages for authentic cases of damage. It is well known that SO_3 will injure vegetation unless it is very dilute. Sulphuric acid works are equipped with precipitating apparatus of the highest efficiency, and it is possible to reduce the amount of SO_3 allowed to escape into the atmosphere to a dilution of 2.5 grains per cubic foot, but smelters can not do this without great expense and loss of efficiency. The smelters in Shasta county, California, are operating under an agreement not to allow more than 12 grains per cubic foot to escape, and even this is difficult of attainment. The best practical test of the effects of SO_3 is to observe whether grains and fruit are able to grow in the neighborhood of the smelter, as the gas is only injurious when concentrated. If the smoke produces no visible effect close to its source, it certainly can not do injury at a greater distance after having been mixed with free air.

In addition to placing their works at a reasonable distance from centres of population, smelting companies are careful to remove the dust from their gases, dilute them with as much free air as possible, and then discharge them into the atmosphere from tall stacks so that they may be thoroughly mixed with the atmosphere by the winds before coming in contact with the earth's surface. More can scarcely be done, short of physically removing the plants to desert places, as was actually done in one case. Smelters need transportation facilities of the best, and these do not usually exist in desert places. Smelters also require workmen, and neither do these inhabit the desert. Under adverse conditions it is possible to operate in desert places, but no industry ought to be obliged to operate under the most adverse conditions. To unnecessarily burden industry is to place a wasteful tax on the community.

It is difficult to believe that a large part of the outcry against smelters is not hysterical in its nature. The Orford Copper Company operates its smelter practically within New York City without experiencing difficulty, although the New York authorities are so watchful of their atmosphere that they do not allow the burning of soft coal. There is a smelter at Perth Amboy, surrounded by large towns and valuable lands, and another at Omaha, within a mile of the post office. Neither of these excites objection. Many of us have worked without injury in smelters, where the fume is many times more concentrated than outside. While we did not enjoy the smell, a suggestion that we contribute a fraction of a per cent of our monthly wage to do away with it would have met with strenuous opposition. Unfortunately, the legal question is not, whether the annoyance of smelter fume is negligible when compared to the benefit of the smelting industry to the community, but whether anyone is annoyed by smelter fume. Those who experience the slight annoyance ought not to be able to cut off the great benefit enjoyed by the community at large.

Are large communities prepared to do without chemical works and smelters, relegating them to a distance? One phase of industrial economy is the securing of a supply of raw materials at as low a cost as possible. Finished products of high value can bear transportation charges with equanimity, but the raw material must be cheap, and usually the chief item in its cost is the freight charge. The large cost of sulphuric acid, white lead, lead pipe, copper salts, and lead and copper products, is generally due to their being produced at a distance from the point at which they are used. Any increase would work seriously to the disadvantage of each manufacturing community, and when we consider the final ramifications of the business interests involved, the total is enormous. We must be guided by reason. The smelters are making every reasonable effort to prevent injury and annoyance from the operation of their plants; any one actually injured can recover damages to the full amount, and to allow the suppression of industries so vitally connected with the prosperity of whole communities, because certain members thereof object to the smell, is not in accord with common sense, nor to the benefit of the greatest number.

A Modern Reduction Plant on the Rand

By Rowland Gascoyne

There has just been started at the City Deep mine on the Rand a reduction plant possessing several unusual points of interest. This plant has been previously described, but its many new features entitle it to more than ordinary attention.

Timber, in the past, has entered largely into the structure of mills on the Rand, but in this instance timber is almost conspicuously absent, its place having been taken by reinforced concrete, and steel girders, and other forms of steel construction. There is, of course, the risk in displacing timber by girders in a mill, that a good deal of shearing of rivets may take place; and again, steel and reinforced concrete can scarcely be expected to have the same accommodating results as timber. In the 600-stamp mill at Randfontein, on the other hand, no effort to spare the use of timber seems to have been made, and reinforced concrete has been only sparingly used.

The plant is designed to treat 65,000 tons per

month, and as the ore is of higher grade than the average of the neighboring mines, when once it gets into proper stride the mine will rank as one of the leading producers on the Rand. Saving of labor costs and economy of handling are other prominent features, while a high percentage of extraction is regarded as certain of attainment. As all the gold will be recovered at one spot in the gold-recovery house, the possibility of thefts, loss from which is estimated to run in some cases up to 10% of the output, ought to be reduced to a minimum. The mill will be driven, as in fact will all the machines at the surface of the mine, by purchased power from the Victoria Falls Power Co., as soon as that company is in a position to supply all the motive power required. At the present time, 50 stamps out of the 200 are running. Power is carried to the required points by underground cables.

The ore is sorted and crushed at the mine in the ordinary manner before being conveyed to the mill. The transport of ore to the mill and all necessary surface work is effected by heavy electrical locomotives using 2000-volt, 50-cycle, 3-phase current.

The stamps are arranged in units of 10, the weight of the stamps being 2000 lb., and the stamps having long heads and short stems. One special feature is that there is only a layer of ½-in. felt between the mortar bases and concrete foundations. Kingposts are entirely dispensed with, the concrete foundations being carried, with indented steel-bar reinforcing, to above the level of the top of the mortar-box. Each cam-shaft is carried by a steel frame, and rests on eleven bearings, so as to minimize the risk of breakage. Stems are 4 in. by 13 ft. long, and the stamps are arranged for a very heavy duty if necessary. Each battery is provided with four Challenge feeders.

Adjoining the mill are nine 22 by 5½-ft. tube-mills, each driven by a 100-hp., slow-speed motor through a reduction-gear; all the other motors are driven by belts.

Next to the tube-mill house, and between that and the sand-plant, the gold-recovery house is placed, and under the same roof are arranged the amalgamating tables, extractor-boxes, clean-up machinery, strong-room, and refinery, as well as the office of the man in charge of the ore reduction.

The solution-sumps are ample in size to meet future extensions of the plant and are placed close to the gold-recovery house. They consist of three sumps 48 ft. by 47 ft. by 12 ft. 9 in. deep, the slime-solution sump being 122 ft. by 47 ft. and 12 ft. 9 in. in depth.

The collecting sand-plant consists of a row of 6 vats, 50 ft. diam. and 10 ft. deep, on reinforced-concrete supports. A 24-in. belt conveys the sand to the top of the sand-leaching vats, consisting of two rows of 6 vats, each 56 ft. diam. by 12 ft. deep built of steel and carried on supports of reinforced concrete.

The slime-plant consists of four conical-bottom collectors, 60 ft. by 10 ft. and 16 ft. in depth, likewise on reinforced-concrete supports. There are two steel, conical-bottomed, air-agitation vats, 32 ft. in diameter and 30 ft. deep, and 8 steel, conical, first and second-wash vats, 70 ft. in diameter.

The sand from the leaching vats is discharged by a Blaisdell excavator delivering to a 24-in. belt under each row of vats. The sand is conveyed by another 24-in. belt up an inclined steel cantilever frame, and is discharged 100 ft. above the level of the ground.

For some time past ore has been developed in the mine on ample scale. In fact, during the last twelve months, 856,879 tons of profitable ore has been developed, so that by the time the mill gets into full swing several years reserve will be in hand. The following ore has been developed during last year:

Quarter ended	Exposures: Distance, ft.	Exposures: Width, in.	Exposures: Value, dwt.	Pay-Ore: Quantity, tons.	Pay-Ore: Value, dwt.
December	2006	19.8	19.8	183,155	7.2
March	1471	19.9	26.0	177,659	10.7
June	3353	17.7	24.7	310,313	9.2
September	2506	17.8	22.2	185,752	7.3

DEMURRAGE IN DREDGING

The following table indicates the time lost on a 5-cu. ft. close-connected bucket-elevator dredge 4½ years in commission during but 12 months of operation:

	Total time lost, hr.	min.	Percentage of total time lost.
Bucket line	161	5	1.834
Tumblers	212	35	2.420
Screens	81	45	0.931
Ladder	502	10	5.717
Pumps	83	5	0.946
Winches	95	10	1.083
Lines	116	50	1.330
Spuds	28		0.319
Motors	18	55	0.215
Power	420	30	4.787
Stacker	239	5	2.722
Stepping ahead	164	10	1.869
Clean-ups	65	45	0.737
Stumps		55	0.010
Other causes	87	40	0.998
Total	2277	40	25.918
Total time running	6482	20	74.082
Total time possible	8760		100.000

Strangely, nearly all the quartz found in gold-bearing gravels is practically barren of gold. Occasionally, though rarely, quartz cobbles or boulders are discovered in the wash that are rich in gold. One reason for this scarcity of gold-bearing quartz probably is, that generally the quartz rich in gold is shattered and rather softer than that which contains little or none, and consequently, the softer quartz is more quickly reduced to sand and small fragments than the barren rock.

Mica, according to D. B. Sterrett of the U. S. Geological Survey, was produced in 1909 to the amount of 1,809,582 lb., worth $234,482. Three varieties are found in the United States—muscovite, or 'white' mica; phlogopite, or 'amber' mica; and biotite. Muscovite is the principal mica mined in this country, for the other varieties are not mined commercially.

Copper Mergers

By Horace J. Stevens

Interest in the Lake region centres in the proposed merger of the Calumet & Hecla with its various subsidiary and collateral corporations. The proposal of the Calumet & Hecla was set before the shareholders of the different companies more than a month ago, and discussion and argument have waxed strong, pro and con. Apparently the Calumet & Hecla management had considerably the better of the argument and the chances of success, until a week ago, when a bombshell was thrown into their camp by Thomas L. Chadbourne, for many years the general counsel of the Calumet & Hecla, and an attorney of wide reputation. Mr. Chadbourne protested against the merger, as the owner of 3100 shares of Ahmeek, worth at present market prices upward of $500,000. Unlike the pronunciamentos of some of the other interests opposed to the merger, Mr. Chadbourne, after stating the grounds of his complaint, also stated the specific remedy, which in this case is the introduction into the Michigan legislature of a bill, similar to the laws now existing in ten other States, providing that in case of a corporation merger, dissatisfied minority shareholders may obtain a court appraisal of their holdings, and be paid the same in cash. There seems little doubt that Mr. Chadbourne will be able to secure the prompt enactment of this bill, and it is likely it will become a law in Michigan before the date set for the proposed merger. It is a question whether the Calumet & Hecla management would care to finance at present, the purchase, for cash, of many millions of dollars worth of stock of dissatisfied minority shareholders.

While there is much talk in the press of a general copper merger, to include all of the leading American interests, and possibly some of the foreign interests also, this is not taken seriously by those who are most conversant with the finances of the copper trade, and the trend of its developments. Instead of a general copper merger, which is not contemplated in the near future, though possibly it may come eventually, it is more reasonable to look for a series of mergers along the present lines of spheres of influence and geographical relations. In this connection, it may be of interest to give consideration to the very pronounced progress that has been made in the direction of a series of large mergers since the panic of 1907. In the case of the Amalgamated Copper Co., the first great copper merger of the United States, now twelve years of age, the situation has been greatly simplified within the past year by the absorption of a number of other copper companies by the Anaconda Copper Mining Co. Most of these companies merged in the Anaconda were controlled formerly by the Amalgamated, this list including the Boston & Montana, Butte & Boston, Parrot, and others, in Butte, but the Anaconda, incidentally, has taken over the entire holdings of William A. Clark in the Butte camp, except his Elm Orlu zinc property, and also has absorbed the property of the Butte Coalition, including the Alice mine. This merger has made for greater simplicity in both operation and finances, though the financial involutions necessitated by the Consolidation have been somewhat perplexing to the uninitiated, for the reason that the Amalgamated Copper Co. has been placed in the positions of both purchaser and seller, and of parent and child, giving the appearance of turning itself inside out. Closely affiliated with the Amalgamated Copper Co. are the so-called Cole-Ryan interests, dominated by John D. Ryan and Thomas F. Cole, Mr. Ryan being the president of the Amalgamated. These interests include the North Butte, now the principal independent property in the Butte camp, the Greene-Cananea, in the northern part of Sonora; the Giroux, now developing at Ely, Nevada; the International Smelting & Refining Co., which has recently blown in a smelter near Salt Lake, and various minor properties. Affiliated with the Cole-Ryan group, through the extensive interests therein of Mr. Cole, are the Calumet & Arizona and the Superior & Pittsburg companies, which are now in the throes of a merger of their own.

The Guggenheim interests, which have made giant strides in copper production during the past few years, have been pretty thoroughly controlled from the start, but have been further coalesced through the purchase of a large interest in Nevada Consolidated by the Utah Copper Co. Affiliated with the Guggenheim interests are the holdings of the Tutt-McNeill-Penrose-Jackling interests. This group really includes the Utah Copper Co. and Nevada Consolidated Copper Co., which as yet remain the pioneers of the so-called porphyry mines, and in addition includes the Ray Consolidated, of Pinal county, Arizona, and the Chino, of Grant county, New Mexico, two prospective important mines of the first order.

The Phelps-Dodge interests are controlled, as they have been for many years past, by this old established firm, which, within the past two years, has become the corporation of Phelps, Dodge & Co., Inc. The Phelps-Dodge holdings include the Copper Queen at Bisbee, Arizona; the Detroit at Clifton, Arizona; and Moctezuma in northern Sonora, all of which are owned practically outright by Phelps, Dodge & Co., and also include the control of the Old Dominion mine at Globe, Arizona, in which there is a very considerable outstanding share interest in the hands of the public. Another copper group of importance is that of the Lewisohn interests, including the Miami mine at Globe, which promises to make a highly successful producer of the porphyry class. It is rumored that negotiations are now under way for a merger of the Miami and Inspiration mines, together with several smaller properties in the neighborhood; all of which have developed more or less ore in an extensive schist belt west of Globe.

Inspection of a list including all North American copper mines having a present productive capacity of 10,000,000 lb. or more yearly shows that a very great majority of the big producers are included in the foregoing groups. The largest interests, outside

of those before referred to, are the United States Smelting, Refining & Mining Co. controlling important properties in Salt Lake and Juab counties, Utah, and in Shasta county, California, with a present productive capacity of about 50,000,000 lb. of fine copper per year; the Copper Range Consolidated, of Michigan, with present productive capacity of nearly 40,000,000 lb, fine copper per year; the Arizona Copper Co., Ltd., a Scotch corporation operating in Graham county, Arizona, with a present productive capacity of about 35,000,000 lb. per year; W. A. Clark's United Verde, of Yavapai county, Arizona, also with a productive capacity of about 35,000,000 lb. per year; the Boleo, of Lower California, controlled jointly by the French house of Rothschild and the Banque Mirabaud, with a productive capacity of about 30,000,000 lb. fine copper per year; the Granby, of British Columbia, with a capacity of upward of 25,000,000 lb. per year; the Quincy, of Michigan, with a capacity of about 20,000,000 lb. per year; the Shannon and the Tennessee Copper companies, with 15,000,000 to 18,000,000 lb. capacity per year each; the Balaklala, of California, which, by the way, is affiliated with the Guggenheim interests through a large stock holding; the Bully Hill of the General Electric Co., also in Shasta county, California, and the Mohawk and Wolverine mines of the Stanton-Gay interests, of about 10,000,000 lb. capacity per year.

Dry Placer Mining in the Quijotoa District

By Fred. W. Fickett

There is a rich gold-placer area west of Tucson and extending north and south some distance on both sides of the Mexican line. This area has been worked in places for free gold by Indians and Mexicans for hundreds of years. It is a desert country, and it is impracticable to get water for mining purposes.

There is gold in the district from the surface down, and into a strata of *caliche* which is really a kind of lime cement. The *caliche* carries more gold than the dirt above it. The Indians work the dirt above it, and then the softer places in the *caliche*, by digging it out, pulverizing it by beating it in a rawhide bag, and then separating the gold with their hand machines, which are crude affairs. White miners have made one or two attempts to work this district, but without success, owing to their inability to pulverize the gold-bearing *caliche* in sufficient quantities and at a cost that would make their operations profitable.

This field requires, first, a machine that will pulverize large quantities of the dirt and *caliche*, thereby liberating the gold which is held in the interstices of the gravel by the *caliche*; and, second, a machine that will separate the gold from the pulverized mass without the aid of water. Both machines must be capable of handling a large tonnage, at a cost of only a few cents per ton.

Something more than a year ago, a machine called the Quinner was perfected. Its purpose is to pulverize the harder gold-bearing strata of this district. It was tried in the Altar district, Sonora, and in Horseshoe basin of the Quijotoa district, and was successful in both. It is claimed that one of these machines will pulverize thirty tons of this dirt per hour, with a gasoline consumption of about two gallons.

During the past year several tables using air under pressure have been introduced to take the place of tables using water for concentration, but I shall refer to only one—the Stebbens table—which is typical of the class. This table was set up and demonstrated in Los Angeles, where small quantities of iron and copper filings were mixed with dirt and gravel, and then the dirt and gravel run over this table. In every instance, it is claimed, the saving was complete. This machine was then brought here to Tucson and erected on the placer ground of the Manhattan company, about seventy miles southwest from this city, where it is now doing everything claimed for it, so far as I can learn.

While I was at Horseshoe basin last month, the company operating there sacked up two tons of the ground product of the Quinner machine and had it hauled by Indians forty miles over to the Stebbens table, for a sample run. This entire two tons was put over the Stebbens table in eight minutes, with a much higher saving than had ever been made before by the people sending the sample. I did not see this run myself, but it was witnessed by a number of prominent mining men. I did get to the Manhattan camp the next day in a cold rainstorm, and remained there until the following morning. The Manhattan company has no cover for this machine, and of course they were not working it during the rainstorm. The next morning I went with the men to where it was, which is about one-half mile from camp, and saw them start it and operate on local material. The wet dirt was removed from the top, and the dry dirt underneath was used. A capacity of fifteen tons per hour was claimed, and its work seemed to me to be unusually good.

A Quinner machine will cost $1500. Three Stebbens separators will cost $3000. Two gasoline engines, one to run the Quinner machine and the other to run the tables, will cost about $3000. Accessories such as shafting and conveyors to carry away the waste product, building material, and tools will cost about $2000. There will be the freighting of this machinery to the property, at a cost of about $20 per ton, and then the erection of it on the ground. This latter will not be a very expensive undertaking. The total cost of such a plant should not exceed $12.000. When completed, it can be operated by three white men and about ten Indians, at a total cost of $60 per day. The Indians work for $1.50 per day of nine hours. This plant can handle successfully from 300 to 400 tons per day of nine hours, and I doubt if it will be possible to get a day's run of the dirt that would produce less than $1 per ton (or cubic yard), while the average would probably be much greater.

Sampling Placer Ground

By J. P. Hutchins and N. C. Stines

***Treating the Sample.**—The material, as it is pumped from the hole, is dumped into a sheet-iron box. This box is 2.5 ft. long, 6 in. wide, and 14 in. deep, and is mounted on 4 angle-iron legs, about 22 in. long. It is open at one end which can be closed by a sliding gate, perforated with ⅜-in. holes to allow the water to drain off the top of the gravel dumped into it. It is sometimes advisable to pan each pumpful when extremely close track of the pay-strata is wanted, but it is usual to allow the drillings from 6 to 12 in. of core to accumulate, and to pan these larger amounts.

Assume that the drillings from 6 inches of core have accumulated in the box. The gate is raised, and the material washed with a gold-pan having a

Fig. 1. Treating the Sample.

screen lying in it. This gold-pan and screen are supported by two sticks across a tub in such a way that the water, overflowing, is caught in the tub. This is done to economize water. The screen is an ordinary gold-pan punched with ⅜-in. holes with an unpunched ring about 1.5 in. wide around the outside edge of the bottom. With such a screen, all material over ⅜-in. diameter can be removed by shaking the screen over the gold-pan without spilling. The oversize is examined to ascertain its characteristics and to insure that no nuggets or undissolved pieces of clay are being rejected. The screen is then emptied into the first panning tub. The pan containing the undersize is panned in the first panning tub, until there is a small amount of material left. The panning is finished in the second tub. This division of panning keeps the water in the second tub clean. When panning is finished, the contents of the pan are examined and the estimated weights and characteristics of the gold and other data are noted in the field-book.

*See 'A B C of Empire Drilling,' *Mining and Scientific Press*, January 7 and 28, 1911.

These data are as follows: (1) Depth from which sample was taken. (2) Whether the pipe sank by rotations or had to be driven. (3) The depth of core in the pipe. (4) The estimated weight and characteristics of the gold. (5) The quality of the material panned and the characteristics of the stratum represented by it. (6) Remarks. Under this head are included general data as to characteristics not included above, and character of bedrock and its depth from surface. (7) Time elapsed and lost time. Time elapsed includes time consumed in drilling, pulling, and moving; and lost time, that time consumed in making repairs, and their cause.

Keeping the Notes.—The following is a specimen page from the field-book:

Depth, in feet.	Rotated From—To feet.	Driven From—To feet.	Weight of gold in milligrams.

[19]Medium gravel and sand.

[20] [21] [22]Medium gravel.

[23]Medium gravel and bedrock.

[24]Bedrock.

[25]Drilled 6 in. below pipe into bedrock. Bedrock soft with much clay on it.

Actual volume panned, 3.75 cu. ft.; finished at 4:20 p. m.; started pulling at 5 p. m.; finished pulling 5:35 p. m.; lost 10 minutes broken chain-tongs. Water-level, 7 feet.

Forty minutes lost in panning sticky clay off bedrock in hole No. 6, 200 ft. south of No. 5 and on same line.

The contents of the pan are emptied into a vessel kept for that purpose. This vessel is low and flat, so as to be difficult to capsize. When the hole is finished, the contents of the cup are emptied into a gold-pan, a small globule of quicksilver added, and the gold amalgamated. When particles of gold do not amalgamate freely, they are rubbed between the finger and the bottom of the pan to brighten them, after which they will amalgamate readily.

The globule of amalgam is transferred to a small glass bottle. The bottle is tightly corked and properly labeled. It is then ready for parting.

Parting and Weighing.—The operation of parting is as follows: The amalgam is emptied into a porcelain crucible or annealing cup and a 50 per cent solution of nitric acid is added. This is digested at a slow heat until all action has ceased, which is noted by the absence of further bubbling and the complete breaking up of the globule. The fluid is then poured off and the gold particles are thoroughly washed with distilled or rain water, to thoroughly clean the gold and remove all traces of nitrate of mercury. An alcohol lamp, a small retort-stand, a sand-bath or piece of wire-gauze, a wash-bottle, and a pair of forceps, though not absolutely essential, are very useful in this manipulation. A candle can be used instead of the alcohol lamp.

The gold is then thoroughly dried and is ready for weighing. In drying, care must be taken that 'spitting' does not occur as the last drop of water is evaporated. When an annealing-cup is used, it is better to remove the last drop of water, by capillary attraction, with a small glass pipette. A drop of alcohol added to the wash-water, as it is being evaporated, will prevent 'spitting.' The gold is weighed on a balance with a sensitiveness of ½ to ¼ mg. The gold is then returned to the glass bottle, and when enough has accumulated, an assay to determine the fineness should be made.

Calculating the Gold Content.—The gold content per cubic yard for each hole is ascertained by using a formula or by actually measuring the volume of material that has been taken from the pipe. The formula is derived as follows:

The outside diameter of the cutting-shoe, 0.38 ft., is taken as the diameter of the cylinder of material which is the sample. The length of this cylinder is the depth of the hole. With a diameter of 0.38 ft., each foot of the cylinder has a volume of 0.1134 cu. ft. Therefore it takes a cylinder 238.1 ft. long to make a cubic yard; therefore the actual value of the gold in cents recovered from any hole is to the depth of that hole in feet as the tenor of the content in cents per cubic yard is to 238.1; or, in symbols,

$$c : d :: T : 238.1$$

$$\text{or } T = \frac{c \times 238.1}{d}$$

where c = value of ore recovered from the hole, in cents,

d = depth of hole in feet,

T = tenor of ground in cents per cubic yard.

In using the actual volume recovered from the pipe, the procedure is as follows: All material is saved in the panning tubs and accurately measured in cubic feet. Then when the value of the gold, c, in cents, is determined as before, the volume of the material in cubic feet = v; the tenor, T, of the ground may be calculated by solving this proportion:

$$c : v :: T : 27$$

$$\text{or } T = \frac{c \times 27}{v}$$

where 27 is the number of cubic feet per cubic yard.

The values for T derived from the solution of these equations are not the same. This is due to the fact that in the first case the theoretical volume of the cylinder in place has been taken, and in the second the actual volume after it has expanded. Gravel that has been excavated has from 30 to 40 per cent more volume than when in place. Therefore, in using the second method, due allowance must be made for this fact. In one examination the ratio of expanded volumes to theoretical volumes in place was found to vary in extreme cases from 1.13 to 1.54, with an average of 1.37, which indicates careful work by the drill crew.

Fig. 2. Record Form.

After the tenor of the ground from each hole has been calculated, an average tenor for the deposit covered by the holes is found in the following way: The tenor of each hole is multiplied by the depth of each hole in feet. This is called the 'weighted value' of each hole. The sum of these products is divided by the sum of the depths of all the holes. This gives the average gold content or tenor per cubic yard of the whole deposit drilled. To illustrate this, suppose that the following data are available:

Depth, in feet.	Value per cubic yards, in cents.	d × T.
20	20	200
15	2	30
30	3	90
25	7	175
10	100	1000
100	122	1495

By dividing the sum of the products, 1495, by the sum of the depth, 100, an average tenor of 14.95c. per cubic yard is determined. By merely dividing

the sum of the values by the number of holes, thus getting an arithmetical average, 24.4c. per cubic yard is found. The selection of the weighted average as the correct one is not arbitrary, for experience has proved that this method of calculation gives results which more nearly correspond with the results usually obtained by actual mining.

The average depth is obtained by dividing the sum of all the depths by the number of holes. Thus in the above instance the average depth would be 20 ft. The volume is obtained by multiplying the area as found from the survey by the average depth. This is generally given in cubic yards.

Prospecting Report.—The form shown in Fig. 2 is used to record the various data. The first tabulation contains 'Data for Valuing.' Column No. 1 is for the actual volume in cubic feet of the sample; column No. 2 for the theoretical volume. The 'Field Log' is a record of the physical characteristics and of the distribution of the gold. The 'Time Log' is a record of the working conditions. In the columns on the right of the sheet are recorded graphically the various strata penetrated, the depth of core, and also whether the pipe was rotated or driven to sink it.

Accuracy of the Sample.—It is probable that the core obtained by sinking rotated pipe is more truly representative of the ground being sampled, than that obtained by driving the pipe, as material properly belonging to the sample is not driven aside, and the cutting-shoe tends to cut a regular core. Further, when running ground is encountered with rotated pipe, there is much less danger of getting an incorrect sample, because the rotated pipe immediately sinks through this ground until it strikes solid material. There is no such action with the driven pipe, and the jarring due to the driving tends to aggravate the difficulties due to running ground. With the power-drill, pumping is usually done infrequently, and large masses of material and water are sucked up at one time, thereby suddenly increasing the difference of water-level between that inside and that outside the pipe, and so conducing to the flow of running-ground, with water into the pipe. There are no such conditions in the manipulations of the hand-drill. The handling of the sample when using the hand-drill is much cleaner than when using the power-drill, and there is no chance for mechanical loss.

Drilling v. Shaft-Sinking.—It is a much-mooted point whether drilling or shaft-sinking is better in prospecting alluvium. It is unquestionable that the larger sample obtained from a shaft is better than the small sample obtained from a drill-hole. However, when a certain amount of time and money is available for an alluvial examination, as is often the case, it is usual that a better idea of the property can be had by drilling numerous holes than by sinking few shafts and getting few samples, and shafts are more costly and slow. If the ground is very wet, not only is it often extremely costly to sink shafts to bedrock, but samples obtained under such conditions are likely to be unreliable. In general, if drilling is properly done, the results obtained may be relied upon. It is good practice to sink a few shafts to check results and to examine the physical conditions of the bedrock and lower gravel. However, it often happens that such work can only be done at prohibitive cost, when ground is wet and loose. As a matter of interest, ground prospected with an Empire drill, when afterward dredged, has shown, by weekly clean-ups, the prospecting results to have been about 90 to 110% of the actual content, while the average of clean-ups and the prospecting results during a great many clean-ups practically coincide.

Mewaing River Placers

By W. B. Winston

Some interesting and valuable experience was gained in prospecting the property of the Mewaing Gold Co. (No. 1), Ltd., situated on the Mewaing river not far from Rangoon, in Burma, British India. The property, which consists of a broad and comparatively flat river bed through which a slowly running stream winds its way, was at first prospected by a hand-drill operated by means of a spring pole, a casing being used and the work carried on in a method similar to that employed in prospecting with machine-drills in California. The results of this prospecting showed that the river gravel and sand extended to a depth of 20 ft., and that beyond this point the gravel became mixed with clay, in increasing proportions, until all trace of gravel was lost at a depth of 30 ft., where a false bedrock of fine clay was found. The gold was distributed through the gravel, the greatest concentration being found at a depth of about 20 ft. From this depth the gold gradually became less until it disappeared entirely at 30 ft. It was therefore proposed to order a dredge, designed to dig to a depth of 35 ft. below the surface of the water in order to insure against difficulties in dredging the deepest parts of the property.

Before ordering a dredge, N. Samwell, then consulting engineer for the company, decided to check the results obtained from drilling, by working several open-cuts across the property. For this purpose, and on account of part of the property being covered by water, he constructed a bamboo raft having in the centre a long open well extending about two-thirds the length of the raft to the forward end, whereon an **A** frame supporting a single pulley was erected. A large steel scoop or shovel was then made and attached to a handle about 35 ft. long. On the upper end of this handle a cross-piece was attached so that the scoop might be guided by men on each side of the well in the raft, and at the lower end a single rope was attached and passed over the sheave suspended on the **A** frame and thence back to the after-end of the raft, where it was attached to the drum of a crude hand-winch. In operation, the scoop was guided and forced into the gravel, by men at cross-bars on the handle, at the same time that it was dragged along the cut and hoisted by the line running to the winch. When raised above the water the scoop

was swung to one side of the raft and the contents dumped into the hopper of a long sluice mounted on the raft, the material being washed by water baled into the sluice-box by natives. Through the operations of this ingenious improvised dredge it was found that the gravel lay on a fine and very soft false clay bedrock at a depth of about 20 ft. The sides of the open-cut stood so well that it was possible to determine the amount of gravel dug up and washed by simply measuring the size of the excavation from which it was taken. The average value of the gold content of the gravel was thus closely determined, and when it was taken into consideration that the gold secured by drilling actually extended to a depth of only 20 ft., the drill results checked closely with those obtained from the open-cuts. It is evident that in drilling, the drill-bit drove portions of the gravel and gold into the soft clay, and these were gradually recovered between the depths of 20 and 30 ft. as the drill-casing advanced. The open-cuts proving that the gold extended to a depth of only 20 ft., instead of 30 ft. as originally indicated, it was determined that the average value of the ground per cubic yard was one-third greater than at first supposed, and that the property could be worked by a dredge designed to dig a little over 20 ft. below the surface of the water instead of 35 ft. On account of the less cost of the dredge digging to a depth of only 24 ft. below water-level, as was finally decided upon, and the greater net returns promised in dredging operations, the attractiveness of the proposition was greatly increased.

Water in Oil Wells

By R. P. McLaughlin

The letter from Mr. W. F. Chandler, a member of the present California Legislature, published in the *Coalinga Oil Record*, and calling for suggestions from oilmen as to legislation affecting water in oil wells, is extremely important. It should be considered thoroughly and as much concerted assistance as possible given to the legislators. Having been intimately connected with the study of the subject in most of the San Joaquin fields, particularly Coalinga, I venture the following suggestions as based on experience.

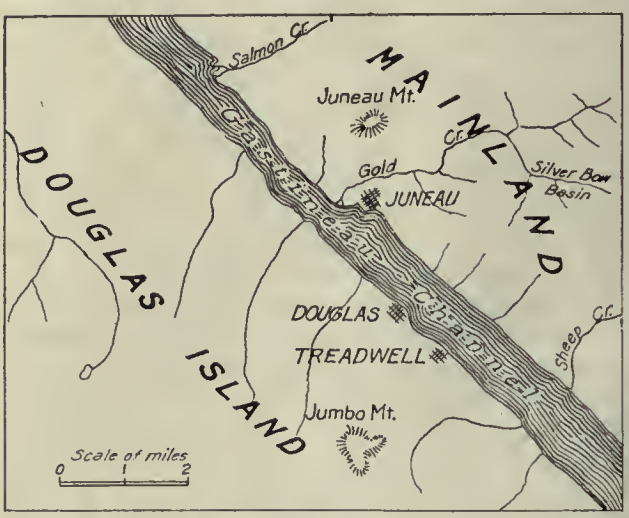
It is a self-evident proposition that all operators are desirous of shutting off the water in their wells, as they want to produce oil, and not water. Therefore, advisory methods are more likely to be of value in legislation than attempted compulsion. As the water-bearing formations are under the surface of the ground, no one person can see them better than another. However, if each operator will make a record of exactly what happened during the drilling of every well—in other words, keep an accurate log—and then will make such a record available to all other operators, it will frequently be found that some general rule can be formulated that will indicate where water is to be expected in drilling new wells. The necessity of determining where the water-bearing formations are, is also self-evident, since no one can successfully shut off water without this knowledge. Occasionally there may be cases where the position of the water can not be determined even after comparison of all the logs; but this is unusual, and every fair-minded person will admit that a guess made by the use of all available evidence, is more apt to be right than one made at random or with only the evidence furnished by one well. Logs are already kept by nearly all the California operators, so this suggestion is not new or radical. However, there is a common feeling that these logs are strictly private property, and this idea sometimes leads to misunderstandings between operators and lack of uniformity in endeavors to shut off water. Therefore, it seems not too much to require that all logs be made public property, under certain conditions, and recorded where they will be kept safely and also be open to inspection. There might be reasonable objection to making the log of a 'wild-cat' well public until the owner had finished the well and had time to reap a just reward for his extra-hazardous expenditure, in the form of securing title to surrounding lands. Consequently, a longer lapse of time after completion (possibly six months) could be allowed before requiring a log to be recorded for a well drilled a reasonable distance (as, for instance, three miles) away from other producing wells. The place for recording might be with any of a number of public officials, but probably the county recorder's office would be most convenient. If desirable, a duplicate copy might be filed with the State mineralogist.

The county water commissioner should be required to see that the record was being made in a manner that would afford the desired information. A penalty should be attached so that the commissioner would not, as at present, be powerless to enforce the keeping and filing of record. The law should also contain a provision requiring that all the logs of wells drilled in the past be recorded, as far as possible; that is, all logs that are at present in possession of the owners of wells. A penalty should also be attached to non-compliance with this clause. The requirement that logs be kept by means of daily drilling reports would not be likely to meet with opposition, as most of the operators already follow this plan in some form or other, and a little systematizing would be the only innovation. The points absolutely necessary in a useful log are as follows: (1) Name of property; (2) number of well; (3) location in section, township, and range; (4) depth to, and thickness of, each and every formation (especially noting oil, water, and tar); (5) depth at which each string of casing is landed or cut off (with note as to whether or not it was cemented, and, if so, how much cement was used and in what manner it was put in); (6) description of all tests made to see if hole was free from water; (7) depths between which each string of casing is perforated; (8) names of drillers and tool-dressers. There are probably other points necessary to legislate intelligently upon the matter, and many operators are in a position to suggest them. The matter should receive immediate attention.

Geology at Treadwell Mines—I

By Oscar H. Hershey

The Treadwell group of mines, comprising the Alaska Treadwell, Seven Hundred Foot, Alaska-Mexican, and Ready Bullion, situated on Douglas island, has been studied and described by various geologists, notably by G. M. Dawson, G. F. Becker, and A. C. Spencer. The mieroscopic character of the ore material was described by F. D. Adams,[1] and some notes have been contributed by Charles Palache.[2] Mr. Speneer's report[3] is the latest and most complete. I have reeently been engaged in a study of these mines, extending over a period of about six weeks, and have, I believe, added something to my knowledge of the conditions under which the deposits were formed. For many years, in the minds of prospectors, the Alaska Treadwell orebody has been the type par exeellenee of a large low-grade gold-quartz deposit; henee, speeifie information as to its charaeteristics will be of general interest to economie geologists. The management of



Map of Juneau District.

the mines has kindly eonsented to the publieation of this paper. I am indebted to the general superintendent, R. A. Kinzie for information and helpful discussion.

The high mountain backbone of Douglas island is eomposed of altered voleanic rocks (apparently chiefly andesites) that are commonly referred to as greenstone. These are flanked on the northeast by black carbonaceous shales, light gray quartzites and fine-grained igneous material, all striking northwest and dipping to the northeast at a high angle. This belt passes toward the northeast into a broad belt of alternating graphitie slates and sheared greenstones. The latter practically disappear at a distance of several thousand feet southwest of the mines, and nearly all the rock beyond to the shore of Gastineau channel, exeept for intrusives, is black slate. Running through the black-slate area at Treadwell there is a long band of igneous rock varying in width from 100 to 400 ft. and averaging about 200 ft., that has long been known as greenstone. Its course and dip conform to the general strueture of the country and were probably controlled by the original bedding of the sedimentary rocks. Mr. Becker[4] considered it a dike of altered gabbro of later age than that of the dikes which have been converted into ore. Mr. Speneer regarded it as a lava flow of earlier age than the ore dikes. My impression is that both are correct in part. I consider it an altered gabbro that was intruded into the sedimentary rocks before the ore dikes. Near the Ready Bullion mine, where the mass is thickest and most eoarsely crystallized, it has the extremely variable texture and general appearance charaeteristie of batholithic masses of altered gabbro. Elsewhere it is relatively fine-grained, but distinctly granular, though the augite has been largely deeomposed to chlorite and epidote, and the feldspars to museovite and caleite. As here the term 'greenstone' properly belongs only to the altered andesites of the region, I prefer to use the self-explanatory term meta-gabbro.

During the development of the slaty eleavage of the region, the borders of the dike were converted by pressure-metamorphism into chloritic sehist and slate. The band on the northeast, or hanging-wall side of the dike, rarely exeeeds 10 or 15 ft. in thickness; but that on the southwest side varies from a few feet to over 200 feet. Close to the massive rock the sehist is moderately eoarse-textured and elearly is derived from the meta-gabbro. Where the band on the foot-wall side is especially wide the texture beeomes finer and the grain straighter, at a distanee from the massive portion of the dike, until the roek is typical slate, as much so as the graphitic slate. The fact that much of the slate in the Treadwell mines is a highly altered condition of a portion of the so-called 'greenstone' has been overlooked by previous observers. The green slate is found only between the black slate and the massive meta-gabbro, and gradually changes into the latter, in one stage being a charaeteristie chloritic schist. The development of sehistosity and slaty eleavage along the borders of the dike has destroyed, or at least greatly obseured, the usual effeets of intrusive contact. Immediately adjaeent to the massive portion of the dike, the schistosity is parallel to it, but at a short distanee it takes on the prevailing strike and dip of the slaty eleavage of the region, which, however, are approximately parallel to the dike and to the original bedding. The ore-dikes have been intruded into the foot-wall band of chloritic slates and sehists, which is proof that they are younger than the meta-gabbro. G. M. Dawson[5] identified the original dike rock that has been converted into the ore of the Alaska Treadwell mine as 'granite' related genet-

ically to the 'granites' of the Coast Range region. Mr. Becker examined the rock after more refined methods had been introduced for study of rocks, and pronounced the original dike material a sodium-syenite, although he preferred the use of the term 'sodium-diorite' or 'albite-diorite.' Mr. Spencer preferred the latter term, and as he has expressed the latest opinion on the subject, I will adopt his term, albite-diorite.

Previous observers seem to have noted evidence of one system only of albite-diorite dikes in connection with the mines, but I believe there were two periods of albite-diorite intrusion. The product of the first I will refer to as the dark diorite and of the second as the light diorite. Most of the ore has been produced by the alteration of the latter. In the Alaska Treadwell mine where the dike is widest, the least altered portion of the light diorite has a granitic texture and resembles a typical, medium-grained, light-colored granite. As we go to the southeast along the dike, through the Seven Hundred Foot into the Alaska-Mexican mine, the less altered rock gradually changes to a semi-porphyritic, light-colored rock. It varies from a medium-grained to a coarse-grained rock having large distinct phenocrysts of white feldspar. It is easily observed in the Ready Bullion mine, where kernels of it are common within and on the borders of the orebodies on the lower levels. It is, however, best preserved in the large dikes that lie southwest of the ore-dikes. Many small dikes and lenticular bodies distributed through the slates between the large dikes are composed of the finer and medium-grained varieties of it. Locally, small needles of black hornblende are present, but it seems in general to have had very little hornblende or other ferro-magnesian minerals. Mr. Spencer describes the phenocrysts as albite-oligoclase, with mieroperthite and some pure albite in the groundmass. The accessory minerals are apatite, zircon, titanite, magnetite, and possibly rutile. Mr. Becker thought that among the ferro-magnesian silicates, augite generally predominated over hornblende, and that biotite was an original constituent. There is very little quartz present.

In the dark diorite, ferro-magnesian minerals, probably chiefly hornblende, are quite abundant. The rock is fine to medium grained, and never porphyritic. Chlorite and epidote have been largely developed, giving much of it a distinct greenish tint. Indeed, in places in the mine workings it has been classed as greenstone. It is commonly mineralized, but usually not enough to constitute ore. Its area abounds in irregular, branching, dike-like bodies of light-colored ore, suggesting that it has been intruded by the light diorite; but for a time it was a question in my mind whether these light-colored streaks did not represent portions of the dark diorite that had been modified by vein-action to resemble the ore of the light diorite. This led to the further suggestion that the two kinds of diorite represent the same intrusion, the differences noted being due to local variation in the conditions of solidification. However, much of the dark diorite seems to have become schistose before the intrusion of the light diorite. They probably bear a relation to each other similar to that between the several varieties of diorite that compose any large batholith of diorite in the Coast Range region, and the time interval between their intrusions may

Large Stope in Treadwell Mine.

have been a short one. The dark diorite occurring in the mines was intruded in two elongated masses at or near the contact between the black slate and chloritic slate. The larger body was about 1000 ft. long, but I do not know how wide, because it has been rent by the light diorite. Important remnants of it occur as a medium-grained gray crystalline in the southwestern part of the Alaska Treadwell mine, from the surface to the lower levels. The other mass of dark diorite is in the Alaska-Mexican mine and has a length of 1100 ft., and a maximum width of 130 ft. Dark diorite also enters largely into the composition of two other large albite-diorite masses lying to the southwest of the mines. A system of light albite-diorite dikes was next intruded, chiefly along two lines, of which one was mainly in or at the contact with the chloritic slate band on the foot-wall side of the meta-gabbro dike, and the other in the black slate. In the immediate vicinity of the mines, the massive meta-gabbro acted as a hanging-wall limit to the intrusion, so that while there are hundreds of small dikes and lenticular bodies in the slates on the southwest of the meta-gabbro, there are none northeast of it.

Within an area 2.6 miles long and 0.8 wide which I mapped, albite-diorite occurs in six principal masses. They are too wide relative to their length to be typical dikes, and too much elongated to be termed batholiths, but I will continue to use the term dike. The Starr dike has a known length of 5000 ft., a maximum width of outcrop of 1100 ft., and an average width of outcrop of 330 ft. However, as it outcrops on the summit and steep northeast slope of two high hills, its actual width is much less than the width of outcrop. Where the outcrop is 1100 ft. wide, the dike is probably 900 ft. wide; it is the widest body of albite-diorite in the vicinity of Treadwell. Both the dark and light diorite enter into its composition, the latter greatly predominating.

The Bear's Nest dike has a length of 3300 ft., a maximum width of outcrop of 600, and an average width of outcrop of 260, though its true width is much less. Both kinds of diorite enter into its composition. The Starr and Bear's Nest dikes and two others back of Douglas City constitute the southwest line of large dikes; this is in the black-slate area. The Treadwell-Mexican dike includes all the orebodies of the Alaska Treadwell, Seven Hundred Foot, and Alaska-Mexican mines, except a small one near the southeast end of the last mine. At the surface it has a known length of 3800 ft., a maximum width of 400 ft., and an average width of 85 ft. It consists of three enlarged parts, separated by long, narrow portions. The most northwesterly enlargement is divided by long overlapping tongues of chloritic slate into the so-called 'South vein' and 'North vein.' The first was intruded into the dark diorite, mainly in a body about 600 ft. long and 300 ft. in maximum width. Small arms of the light diorite have intruded into the dark diorite, so that little of it is entirely free from them. Where these arms are numerous they have carried enough gold into the rock to constitute profitable ore. There are also a few places where the dark diorite itself is sufficiently mineralized to be ore, but generally the area of the dark diorite on each level is not stoped. Near the surface practically all of the light diorite is ore. The remainder of the great northwestern enlargement is about 1800 ft. long and 150 ft. in maximum width, of which nearly all, near the surface, has been removed in the Glory Hole and Seven Hundred Foot pit, except a considerable body at the extreme northwestern end which was found of too low a grade. This portion of the dike has been intruded entirely in the band of chloritic slate and schist which was developed on the southwest side of the meta-gabbro dike, and the isolated horses and projecting splinters are of chloritic slate, except that a little massive meta-gabbro appears in a few horses near the hanging wall on the 110-ft. level. The larger structural features of the northwestern enlargement are remarkably persistent down to the 1450-ft. level, the deepest fully-developed level in the Alaska Treadwell mine. The chloritic slate horses vary a little in size and position, and in the South vein the relative proportions between the dark and light diorite vary considerably from level to level, but the general structural relations remain unchanged, and the size of the enlargement, as a whole, does not greatly differ. Next, there is at the surface an interval of 1000 ft. which is known from underground work to be practically a continuous 'pinch.' However, it becomes shorter with depth and finally changes into a body of workable ore which is separated from the adjacent swells by short pinches. At the most northwesterly Alaska-Mexican pit, there was an enlargement probably 200 ft. long and 50 ft. in maximum width, most of which, near the surface, was removed in the pit. It enlarges with depth into what may be called the main Mexican swell, which, on the 1100-ft. level is over 700 ft. long and has a maximum width of 100 ft. Near the surface, after another pinch, about 400 ft. in length, the dike opens into the eastern Mexican swell, which was principally mined in two surface pits and was found to be 500 ft. long and probably 75 ft. in maximum width. This swell was due to the erratic behavior, near the surface, of a mass of dark diorite into which it was partly intruded, and it has not been found below the 330-ft. level. Near the southeastern end of the Alaska-Mexican mine there is a sharp bend to the east in the meta-gabbro dike. The slaty cleavage bends also, but not so much as the dike, and since the ore follows the slaty cleavage, it is carried off into the black slates, and the eastern swell is almost entirely separated from the chloritic slate. Back of the eastern swell there is a smaller ore-bearing dike in the black slate. These are the only places in the mine where commercial ore occurs in dikes having black slate on both walls. The Ready Bullion dike at its outcrop had a length of 560 ft., a maximum width of 60 ft., and average width of 40 ft. With depth it shows a remarkable increase in width accompanied by a slight decrease in length, so that it is practically a large triangular

pipe rather than a dike. On the 1350-ft. level it is probably 500 ft. long and 290 ft. in maximum width. It comes to a rather sharp point at the southeast, but terminates northwesterly by fingering out in the chloritic slate. Its position and pitch are evidently controlled by a wedge of chloritic slate into which it has been intruded. This wedge, which is a few feet wide at one end and over 200 ft. wide on the lower levels, at the other end, may be related to an abnormal swell in the meta-gabbro dike a short distance southeast of the mine.

If the two large southerly dikes be considered as one line of dike and the ore-dikes in the mines as another, the swells in one line will be found opposite the pinches and intervals in the other line. There is a very simple explanation of this. These albite-diorite dikes did not make their way up through the strata by 'overhand stoping,' as it is supposed that many granitic batholiths have, nor did they rise freely in open fissures as many ordinary dikes have. The melted rock forced its way up through the slates under great pressure, rending them and wedging them apart. In minor detail, the contacts are splintery, and tongues of slate project far into the dikes; but looked at from a broader standpoint, the slates are found to curve around the swells in the dikes. Nearly everywhere the strike and dip of the slates are approximately parallel to the borders of the dikes. The albite-diorite had to raise the slates above it, but there was a limit to the distance to which it could force them. The larger dikes divided this space between them. Thus when one dike appropriated practically the entire space available, there was opposite it a pinch or interval in the other line of dikes. This idea has a practical bearing on the search for ore in virgin ground. In the belt of black slate between the Alaska Treadwell swell and the Bear's Nest dike there is a long band, generally 25 or 30 ft. wide at the surface, of a white to dull-buff rock that resembles a quartzite of heavy-bedded structure and conforms strictly to the slaty cleavage. However, at two places there are traces of feldspar crystals in it, and in the absence of a petrographical investigation I consider it probably an aplite dike. A short distance south of the Seven Hundred Foot pit there is a small lenticular area of a greenish, rather coarse-grained, massive crystalline rock of the mineralogical composition of diorite, but with the general appearance characteristic of meta-gabbros. It has a fresher appearance than the meta-gabbro on the northeastern side of the mines, and contains many small inclusions of porphyritic albite-diorite like that of the small dikes so abundant in its vicinity. I have never seen any albite-diorite inclusions in the meta-gabbro dike on the hanging-wall side of the mine, though A. C. Spencer states that G. F. Becker found one in it. Perhaps it came from this other, and presumably younger, meta-gabbro.

At various places in the Alaska Treadwell, Seven Hundred Foot, and Alaska-Mexican mines there are basalt dikes that vary from a fraction of an inch to 4 ft. in thickness, 6 and 8 in. being a common thickness. They have a general course nearly north-south, and stand vertical or dip steeply toward the west, or, less often, toward the east. A minette dike 2 to 3 ft. thick has been cut on the Alaska-Mexican 1100-ft. level. G. F. Becker was inclined to see a genetic connection between the largest basalt dike (the only one then known) and the ore, but I agree with A. C. Spencer that the basalt dikes are younger than the ore and have nothing to do with its origin. Not all of the Treadwell-Mexican and Ready Bullion dikes is commercial ore. The causes that have controlled the position and shape of the ore-shoots within the dikes and their variation from level to level are obscure, but I make here a few suggestions. A. C. Spencer, in the report cited above, has given a very minute description of the ore and discussed its origin at length; the necessarily limited nature of this paper will not permit of a similar treatment of the subject. Briefly stated, the ore consists of two parts, one of which is dike rock in which secondary albite has been developed (largely by replacing the interstitial microperthite, though some was deposited by vein-waters from material added), and which is impregnated with calcite and pyrite, only a little silica penetrating where there were no open fissures. The dike was in part shattered and then filled by reticulating veinlets of calcite and quartz, which also carry sulphides. Mr. Becker thinks the disseminated pyrite has probably been derived by the action of sulphydric acid on the ferromagnesian minerals and that the bunched pyrite which is accompanied by much calcite has entered the rock in a state of solution. The secondary minerals, as determined by Mr. Spencer, are albite, uralite, green mica, epidote, chlorite, zoisite, calcite, quartz, sericite, rutile, pyrite, pyrrhotite, with molybdenite, galena, sphalerite, chalcopyrite, and arsenopyrite occurring exceptionally. Some of the magnetite may also be secondary. There is probably some siderite also. The quartz and calcite veinlets, which constitute nearly one-fifth of the mass of the ore, occur chiefly in two sets of fractures, one of which is approximately parallel to the structure of the enclosing slates and in places prolongs the veins beyond the ends of the dikes as narrow quartz-veins which are said to exceed the average tenor of the ore, but are too small to mine. The most prominent system dips toward the foot-wall. In general, the best ore is that which contains the greatest number of quartz and calcite veinlets, though there are places where good ore has been formed without them, and other places where rock abounding in veinlets lacks the usual quantity of pyrite and is too low in grade to work; for the gold is apparently mainly associated with pyrite, though there are a few places where rock well supplied with pyrite yields only a very small amount of gold. The gold is generally very fine, but some has been seen in coarsely crystalline calcite, and Mr. Adams observed some mechanically enclosed in crystals of pyrite. Mr. Spencer thinks the 60 to 75% that is recovered by amalgamation may be partly in the non-metallic minerals, though the non-amalgamat-

ing portion undoubtedly occurs with the pyrite. The concentrate, chiefly pyrite, with some pyrrhotite and magnetite, averages 2% of the ore. The pyrite in places extends several feet into the slate walls and horses, but such material generally is of very low grade, though some of it is mined and known as 'brown ore.' It is evident that the formation of the ore was dependent on the fracturing of the dike. This was the result of pressure originating beyond the dike. The so-called ore-shoots consist of those portions of the dike that yielded most readily to the compressive stress, became most permeable, and hence were most strongly acted on by the vein-forming waters. The distribution of the gold is very irregular. During the progress of development samples are taken at every round. They yield by assay at the rate of from a trace to over $20 per ton. Upon being averaged for certain sections of drifts they vary from less than $1 to over $10 per ton. In the following table, No. 1 represents 210 ft. of a drift on the 1450-ft. level of the Alaska Treadwell mine; No. 2, 160 ft. on the 1210-ft. level of the Alaska-Mexican mine; and No. 3, 150 ft. on the 1350-ft. level of the Ready Bullion mine. They were selected at random and are given to show how the gold content varies rapidly in short distances within the orebodies. The figures may interest the prospector who has a large low-grade mass of gold ore with a few assays to indicate value.

By studying the averaged assays, one can get a very clear conception of the total gold content of the dikes on the different levels. There is a peculiar horizontal banding in the gold content of the dikes in all the mines. Thus in the Ready Bullion mine there appears to have been a rather steady decrease in the gold content from the surface to the 600-ft. level; from there, an increase to the 1350-ft. level, below which the pendulum has swung temporarily in the other direction. This variation is not directly related to the maximum thickness or size of cross-section of the dike; but, of course, it influences the size of the ore-shoot on different levels; for, where the total gold content is low, a relatively small amount of the dike is commercial ore, and on such a level as the 1350-ft., where the total gold content is the highest in the mine, nearly all of the dike is workable ore. I have been unable to determine that the ore-shoot is closely connected with any structural feature. It seems to wander about in the dike. The only point it never misses is the foot-wall side a little southeast of the centre; the part of the dike it most avoids is the extreme northwest. In the South vein of the Alaska Treadwell mine, the gold content was relatively high from the surface to the 220-ft. level; thence decreased to the 440-ft. level, thence increased irregularly to the 1450-ft. level, the present lowest fully-developed level and by far the best in the mine. This variation seems to have been more or less directly related to the variability of maximum thickness of the light diorite, the highest average gold content being found on those levels having the widest body of light diorite. The South vein contains one large ore-shoot which, where the body of light diorite is very wide, occupies nearly the whole of it, but where the light diorite is narrow, it is inclined to wander about a bit. However, as it cannot get out of the light diorite body, it must have the same general pitch. In the North vein, the gold content seems to have been rather high, down to the 220-ft. level. Thence it decreased to the 330-ft. level, after which there was no great change to the 750-ft. level. But the 900-ft. level was so poor that very little of it was ore, although the South vein on this level was good. The North vein quickly picked up again below the 900-ft. level, and on the 1050-ft. level its average assays are better than those of the South vein. Thence to the 1450-ft. level, the North vein maintains a good gold content. The principal shoot of ore in this vein is related to the widest part of this portion of the dike. It varies greatly in length, width, and value, but is absent from only one level. There is a considerable body of worthless rock at the northwest end of the North vein on all levels but one. Its notable feature is that while it has considerable quartz and calcite in veinlets, it is relatively low in pyrite.

Selenium was produced as a by-product in copper refining by one company in the United States in 1909. It sold for $3.43 per pound, but if large quantities of the element were needed it could be profitably sold at a much lower price.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Trans-Siberian Travel

The Editor:

Sir—Traveling on the Trans-Siberian railway is much more comfortable east of Irkutsk. The division of the line between Irkutsk and Vladivostok is known as the Chinese Eastern railway, and the branch from Nikolsk-Ussuri north to Habarovsk on the Amur river is known as the Ussuri railway. This accounts for the fact that a through ticket from Vladivostok to London is issued under the name of the Ussuri railway. The hotel opposite the railway station in Vladivostok is known as the Grand, and it is a grand failure as a hotel. I have never stayed at the others, but if I may be permitted to drop into early Victorian English for a minute, one who stays at one of the hotels in Vladivostok wishes one had

Locomotive on Chinese Eastern Railroad.

stayed at any one of the others. Opinions vary as to whether the traveler starting from Vladivostok should take the International express of the Wagon-Lits company or the Government express. The first is better fitted up, but is lacking in politeness. The second is lacking in the matter of English language and private lavatories, but has better food and courteous attendants. It must be said that the Wagon-Lits company, which in western Europe supplies its patrons with fifth-class imitation of American Pullman accommodation, at millionaire prices, affords much better accommodations in the Russian Empire. The Wagon-Lits company operates the best train it possesses anywhere, between Vladivostok and Irkutsk over the line of the Chinese Eastern railway. The accommodation grows progressively worse as you approach Paris.

The expenses of a man who travels this route second-class on the Trans-Siberian and American railways, and first-class on intermediate steamers will be about three-quarters of that below. In first-class travel by the Trans-Siberian, a traveler taking the Government express is nearly sure to have a compartment to himself by paying for one berth. This is the reason the price in the list below is compared with that of a compartment in crossing the United States.

The following estimate of expenses, London to London, around the world, by way of Trans-Siberian, may be of use. The items include meals, sleeper, tips, and hotel arrivals and departures:

	Cost.	Time, days.
London-New York	$ 150	6
New York-Yokohama (via San Francisco):		
Fare (including berth and meals on steamer)	281	22
Pullman compartment	54	
Meals and extras	60	
Yokohama-Vladivostok (via Tsuruga)	35	3
Vladivostok-London (via Moscow)		12
Fare includes sleeper	215	
Meals and extras	75	
100 lb. excess baggage (100 lb. free)	25	
Extra expense and time for making connections	105	7
Total	$1000	50

The distance traveled by rail and the Channel

A Slight Disarrangement of Traffic in Manchuria.

passage from Vladivostok to London is about 8300 miles, and assuming that from New York to San Francisco at 3000 miles, the comparison of rates per mile for first-class transportation figures out at 3c. for the Siberian route, as against 4½c. for the United States. As the accommodation in the United States is proportionately better, however, the traveler gets his money's worth in both cases.

Nitre in Crucible Assay

The Editor:

Sir—On page 93 of Fulton's 'Manual of Assaying' the author says, "Where large quantities of nitre are employed, the oxidizing action in the crucible is greatly increased, and it is probable that thereby losses in silver are apt to occur by the slagging of the silver. There is no accumulative evidence on this subject, but many assayers hold this opinion."

For some time I have recorded silver values by crucible with nitre, and by scorification. As these were umpire determinations, each result is the av-

erage of at least six fusions. With few exceptions, the crucible charges were ½ A. T. and the scorification $^1/_{10}$ A. T. In 85 samples, of an average value of 167 oz. Ag, the scorification averaged 0.918 oz. or 0.55% more than the crucible. The nitre varied from 6 to 25 gm. Only occasionally were the results higher by crucible, and this occurred as often with nitre high as with it low. The assay of six samples of an average value of 1103 oz. reversed this, as the crucible assay gave 4.45 oz. or 0.4% more than the scorification. On these high-grade ores ¼ A. T. crucible charge and $^1/_{20}$ A. T. scorification, gave the difference the same way. In this case the low scorification result is probably due to volatilization when rich ore floats and is wasting on the lead bath.

Progressive Mill Practice

The Editor:

Sir—In your issue of January 21, under the heading of 'Progressive Mill Practice,' you suggest that California millmen be more progressive and alert to the possibilities developed by others working along the same lines, referring more particularly to the practice in South Africa of equipping the stamp-mill mortars with coarse screens and thereby increasing the capacity of the plant to about double, without a proportionate increase of power consumption.

If you will refer to the article by myself in the *Mining and Scientific Press* of April 30, 1910, you will see that at least one California millman is not so slow in the recognition of a good thing, and was more of an originator than imitator of the practice which is being so almost universally adopted in South Africa.

"At Tuolumne Mr. Elmer is crushing through a four-mesh battery screen. A short copper plate is interposed between the screen and the pebble-mill and the total product, amounting to upward of about 100 tons in 24 hours from 10 stamps, is then passed directly to an 8-ft. Hardinge mill into which is fed at regular intervals of half an hour, a spoonful of quicksilver; the regulation wooden mustard spoon being used. From the pebble-mill the pulp is run through a box distributer over a second set of amalgamating plates, where additional free gold or amalgam produced within the mill is caught." (A plan of the flow-sheet then follows.)

This innovation by Mr. Elmer was based upon the use of coarse screens on the stamp batteries of the Creston-Colorado mine at Minas Prietas, Mexico. Coarse screens were adopted there, to my certain knowledge, as far back as 1897, and have been continuously used at that mine, with the exception, however, that they are now using screens of practically ¾-in. mesh, the discharge going to re-grinding machines.

Though admitting that the California millman is practically wedded to his stamp, at the same time full credit must be given him for setting a style when he furnished his lady with a new dress which does not 'hobble' her activities. The introduction of coarse crushing by stamps was the cause of my being such a staunch advocate of the oft-repeated statement that the stamp should not be considered as a fine grinding machine, for as such it is wasteful of energy.

Our friends in South Africa deserve all the credit they are receiving for what to them is original work, but at the same time we should give credit to any young worker who makes an advance in methods, such as Mr. Elmer did, in a field of conservative stamp-mill practice like those found in many of our Western mining camps. For myself, I believe that the stamp has seen its best life; I realized this in 1897. Then why does it exist? For the same reason that a candle exists in these days of electric lights. Local conditions govern its use.

H. W. Hardinge.

A B C of Empire Drilling

The Editor:

Sir—The articles by Messrs. Hutchins and Stines appearing in your issues of January 7 and 28 on the 'A B C of Empire Drilling' were of great interest to me, and the troubles which R. B. McGinnis relates in his letter published in your issue of January 28, are due, in my estimation, to two causes, namely, his failure to constantly rotate the casing and his neglecting to start the hole perfectly plumb and with the top ground firmly packed.

I have used the Empire drill in all my work for the last two years, in some instances in ground similar to that described by Mr. McGinnis, and have not had such difficulties. I find that it is most essential to rotate the casing continually, as it makes both the sinking and pulling of it much easier, especially when one recalls the many difficulties encountered in steam drilling when driving and pulling the casing. I can sympathize with Mr. McGinnis when it comes to the troubles with the cutting shoes, as I have had some difficulty with them. However, this was about the only difficulty that I had, and I soon learned to draw the temper of the shoe just a little when drilling in hard ground, as these shoes are very hard when received from the manufacturer, and while they work well in this condition in medium gravel, for hard gravel and large boulders the temper should be slightly drawn. The cutting shoe is about the only part of the drill that ever wears, and a few extras should always be on hand, as suggested by Mr. McGinnis.

In some recent drilling in eastern Canada I put down 38 holes ranging from 38 to 73 ft. deep, averaging 36 ft. drilled per day at a cost of 41.63c. per foot, and in this entire work I used only two cutting shoes, which were occasionally ground down. This is about double the amount of work at one-half the cost of any steam drilling that I have ever done. I hope you will publish more of these articles on drilling with the Empire, as they deal with the whole process in so much detail as to be interesting.

Fred J. Siegel.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Patents are obtainable upon any combination of old elements that produces a new or better result. On the contrary, if each performs its office independently the device is not patentable. A knife having a cutting blade, a file, and a corkscrew or other implements in the same handle is not patentable. Each instrument acts alone and not in conjunction with another to produce a new result.

A satisfactory powder for flash-lights to be used in photography may be made by mixing 20 parts by weight of magnesium, 20 parts permanganate of potassium, and 10 parts barium peroxide, to be ignited by a spark or small cap. Powder must be used with judgment. In underground work where everything is black or dark colored, a much larger quantity is required than in a stope where the surrounding walls are dazzling white quartz.

Mineral claims may be located within a National Forest (forest reserve) as readily as on any portion of the public domain outside of a reserve. There are no special regulations governing the location of a mining claim within a National Forest. The forest officers may investigate in order to determine the good faith of the locator and whether a valid discovery has been made, but this does not alter the prevailing law.

Compressed-air sewage ejectors, according to *Ideal Power*, were put in a few years ago in Guildford, England, to raise sewage from low-lying areas and permit it to discharge into the basins at the sewage-treatment works. There are eight of these ejectors in use with capacities ranging from 50 to 1200 gal. per min. The compressed air for operating them is furnished by a power station situated adjacent to the town refuse-destructor. The waste heat from this destructor generates sufficient steam to drive the air-compressors which raise the sewage.

Wool, cotton, silk, and other fibres all have more or less rough surfaces, and when spun into a thread this roughness aids in holding the mass together. While its fibres are almost infinitely finer than these, asbestos has an absolutely smooth, glossy surface, and for a long time this characteristic prevented the successful spinning of what was otherwise an ideal fibre. The overcoming of this difficulty has made possible the spinning of a fairly strong thread weighing approximately an ounce per hundred yards of length.

Fertilizers for agricultural purposes are made from various substances, the most important constituents being potash, nitrogen, and phosphoric acid in such a form that they can be readily absorbed by the plant roots. Phosphoric acid is obtained by treating phosphate rock with sulphuric acid to convert the insoluble rock into the so-called 'superphosphates,' the soluble form. As fertilizers must be reasonably cheap to be of use, deposits of phosphate rock must be adjacent to cheap transportation to be economically available, otherwise the cost of handling will be too great.

Antimony is not produced in the United States except as a by-product, according to F. L. Hess, of the U. S. Geological Survey. A considerable quantity was recovered from various wastes, such as old type and babbitt metal, and some antimonial lead was produced as a by-product at smelters and refineries. The imports of antimony were large, the total value of the metal and ore entered for consumption during the year being $774,719. In all, 1617 short tons of antimonial lead, valued at $252,252; 743 short tons of antimony from foreign ore smelted in this country, valued at $115,908; and 1556 short tons of antimony recovered from old alloys, valued at $242,736, were produced here in 1909.

Cement floors, particularly in office buildings or warehouses, which do not have the advantage of obtaining the necessary moisture from the atmosphere such as outside floors and sidewalks on which the dew falls at night, if not properly protected and kept damp, become prematurely dry and are therefore more or less porous and weak, causing easy abrasion under foot traffic. Care should be exercised in keeping such floors damp by covering with wet sand, wet hay, or straw, for a week or more, until the floor has properly hardened. If this has not been done and the floors are found to dust under foot traffic, the following remedy, devised by Albert Moyer, will be found easy and effective. Wash the floor thoroughly with clean water, scrubbing with a stiff broom or scrubbing brush, removing all dirt and loose particles. Allow the surface to dry and apply a solution of one part water-glass (sodium silicate) of 40° Baumé, and three to four parts of water, the proportion of water depending upon the porosity of the concrete. The denser the concrete the weaker the solution required. Stir well, and apply this mixture with a brush (a large white-wash brush with long handle will be found the most economical). Do not mix a greater quantity than can be used in an hour. If this solution is sufficiently thin, it will penetrate the pores of the concrete. Allow the concrete surface thus treated to dry. As soon as dry, wash off with clean water, using a mop. Again allow the surface to dry and apply the solution as before. Allow to dry and again wash off with clean water, using a mop. As soon as the surface is again dry, apply the solution as before. If the third coat does not flush to the surface apply another coat as above. The sodium silicate which remains on the surface, not having come in contact with the other alkalies in the concrete, is readily soluble in water and can therefore be easily washed off, thus evening up the color and texture of the floor. That which has penetrated into the pores, having come in contact with the other alkalies in the concrete, has formed into an insoluble and hard material, hardening the surface, preventing dusting, and adding materially to the wearing value of the floor.

Concentrating Tin Tailing in Cornwall.—Flotation Processes at Mount Lyell.—Treating Stannite Ores.—The Ferreira Deep.

One of the most interesting ventures in Cornwall at the present time is the exploitation of old tailing heaps at the Carn Brea & Tincroft Mines at Camborne. A company was formed a year ago, called Cornwall Tailings Limited, for the purpose of acquiring and re-treating these dumps. The financial supporters of the scheme form a group well known in connection with Australian mining, the names including Baillieu, Robinson, Clark, and Lempriere. Arthur Richards is engineer and managing director, and it is due to his energy that the project was started. Most of the tailing at the Camborne mines is washed down the Red river. Owing to lack of water much of the tailing at Carn Brea & Tincroft could not be so removed, and it has been stacked in one compact dump. This was carefully sampled by boring and was estimated to contain over one million tons of material. The chemical assay showed an average content of 17 lb. metallic tin per ton. A concentrating plant was erected, and during the six months ended December 31, 24,000 tons of material was treated, yielding 93 tons of black tin which sold for £6901. This recovery is 8.68 lb. black tin per ton, which is only 30% of the content according to chemical assay. The price received per ton was 5s. 9d. and the cost including purchase was 3s. 1½d. per ton. The total profit was £3144. Additional machinery is now being erected, and by next month the capacity will have been increased to 200 tons per day. By the end of the present year the plant will have been further extended so as to treat 400 tons per day. The figures for recovery are low, but slime tin is difficult to treat. It is expected that the extraction will be gradually increased until 50 to 60% is recovered. Many people may think 17 lb. of metallic tin a high figure for a dump, but it must be remembered that much of the material was stacked 30 to 60 years ago, when the content of the ore mined was four or five times as great as that of the ore at present being mined. This constitutes one of the most interesting ventures in Cornwall at the present day, and the satisfactory results so far obtained are a matter for congratulation.

The application of flotation processes in the Mount Lyell copper district, Tasmania, is watched with great interest, and the prospects of the Elmore process at the Mount Lyell Comstock are keenly followed. The Comstock company was originally floated in England in 1898 to acquire the property from an Australian company and for years the work has been unsuccessful. The company was reconstructed in 1907, and the management was placed with Alexander Hill & Stewart. Hitherto the ore discovered has been low grade and highly silicious, and treatment at a profit has been impossible. Recent reports show that development and prospecting work has been attended with satisfactory results. It is now estimated that 300,000 tons, averaging 2.8% copper is available in existing levels, and that another 300,000 tons varying from 2.8 to 4.5% copper will be developed in other parts. In addition to these resources there are strong indications of the ore continuing laterally and in depth. The outlook is encouraging, seeing that the recently developed ore is of a higher grade than that in the upper levels. Experiments with the Elmore process show that freshly broken ore from the lower levels is amenable to this treatment, but it is not so certain that the ore that has been exposed for a long time to the atmosphere in the upper levels will give good results. Some of the sulphide is partly oxidized, thus becoming untreatable, and in other ore the gangue is so much decomposed as to make a clinging slime. The engineers recommend the provision of an Elmore plant to treat 250 tons per day. To provide the necessary funds the directors intend to place before shareholders at an early date a proposition involving the issue of preference shares.

Nearly three years ago the Comstock company became interested in the Oonah mines, near Zeehan, Tasmania. In earlier days this property had yielded silver-lead ores, but more recently lodes containing stannite, that is, sulphide of tin and copper, have been worked. The metallurgical problem was an extremely difficult one. The process eventually recommended by Alexander Hill & Stewart was smelting in a blast-furnace and producing a copper-silver matte and an argentiferous copper-tin alloy, with the subsequent refining of the matte in a reverberatory. Pot-roasting was then adopted as a preliminary to the blast-furnace treatment. The recent news has been most disappointing, for the sintering operations commenced in October soon proved to be unsatisfactory. In December it was found that the rate of operation of the process in the pots was not nearly sufficient to keep up with the blast-furnace. Operations were therefore suspended. Unfortunately the capital of the company is exhausted, and the future is uncertain.

The safety of the workings on the Rand are attracting attention in England and the recent report by Ferreira Deep is taken as a good sample of what may be expected in the future. That the movements of the hanging wall have not had more serious results is the only wonder. A year or more ago it was known that the pillars left behind were not sufficient to prevent movements of the superincumbent strata. At first attempts were made to strengthen the supports, especially near the main haulage-ways, by packing with waste, but, as this was not sufficient to meet the case, it was found desirable to resort to close timbering. Subsequently, in June last, in order to give permanent support, experiments were made with sand-filling. Up to the end of September last 87,587 tons of tailing had been deposited in the mine in this way. Under the circumstances above detailed it was natural that the mining operations were interfered with considerably and the costs increased. The amount of ore raised during the year ended September 30 was 53,910 tons less than the previous year. The development was curtailed, being not much more than was required to keep pace with the extraction of ore. The cost of treatment increased by 2s. 8½d. per ton from 16s. 2½d. to 18s. 11d., though, as the yield per ton increased 2s. 7d. per ton the actual decrease of profit per ton was only 1½d. Owing to this and to the smaller tonnage crushed the total profit was less by £80,941. The report by the manager, W. E. C. Mitchell, shows that during the year under review 454,571 tons of ore was raised and after the removal of 20% waste, 364,147 tons went to the mill. The content of the mill-feed was 11.7 dwt. and the recovery by amalgamation was 141,206 oz. or 7.75 dwt. per ton. In the cyanide plant 364,487 tons yielded 66,874 oz. or 3.67 dwt. per ton, and the residue assayed 0.5 dwt. The total yield was 208,080 oz., worth £873,337, and the working cost was £344,400, leaving a profit of £528,937. The yield per ton milled was 48s., the cost 18s. 11d., and the profit 29s. 1d. The amount distributed as dividend was £500,500, being at the rate of 55 per cent.

Ferreira Deep.

TORONTO, CANADA

Investments Made in Porcupine Claims.—Development News. — Cobalt Output.—Iron and Steel Bounties.— Brazeau Coalfields.

F. A. Heinze has purchased the Foster claims, adjoining the Dome mine, and has engaged R. Alvin Weiss to take charge of development. It is understood that the price paid was approximately $300,000. This investment is regarded as indicating a growing interest in the camp on the part of American capitalists. Of equal, or perhaps greater, importance is the organization at London, under the auspices of Bewick, Moreing & Co., of the Northern Ontario Exploration Co., capitalized at £400,000, and embracing among its promoters the Earl of Errol, Sir William Bell, David Richards, and John Barry. It is announced that Alex. Moreing, David Richards, and a staff of engineers will shortly arrive in Porcupine to investigate properties with the view of purchasing, and brokers and claim-owners are eagerly awaiting their arrival. Some investors who have recently visited Porcupine are of the opinion that the prices asked for undeveloped claims are unreasonable, and that unless owners are willing to accept lower terms with small payments of cash down, practical mining men will not buy. A number of claim-holders have had little or no mining experience, and the announcement of a good find in proximity to their holdings leads them at once to put their price at extravagant figures. The Pearl Lake Gold Mines camp is complete, having accommodations for 45 men. Sinking is to be commenced at once on a lode of free-milling ore. The Scottish Ontario has decided to sink another shaft on the vein north of the main shaft. There is one Nissen stamp in operation at the Vipond, where a 10-stamp mill is soon to be erected. The main vein, where opened at 100-ft. depth, has a width of 7 ft. The Leyson claims, in North Whitney, have been sold by A. J. Young, of North Bay, to Major Vane. The Mancha-Newman syndicate, holding 13 claims in Deloro, has 20 men at work stripping the veins. The Flynn Bros., of New York, the principal owners of the Vipond, have taken over the Hughes claim, half a mile north of Porcupine lake, at $300,000. Stripping there is being done under the direction of Thomas J. Flynn, and a shaft is to be sunk. The Porcupine Exploration Co. has acquired the three Thompson claims in Whitney, adjoining those of the Timmins syndicate. Among prominent mining men recently in Porcupine were A. C. Conway and Charles Connolly, of Colorado, and E. C. Aman, of London.

There was recently a falling off in the ore-production of Cobalt, owing to an accident to the hydraulic power machinery at Ragged Chute. Some of the mines have had their power cut off and others have been working intermittently. The Temiskaming is in good ore in the winze on No. 3 vein 37 ft. below the 500-ft. level. This is the deepest working in the camp. The main shaft of the Beaver is being put down to 400-ft. depth. A station was cut at 350 ft., and a cross-cut toward the main vein has been started. A rich ore-shoot, 11 to 16 in. wide, has been opened at the 300-ft. level on vein No. 5, and this has been followed 30 ft. A favorable statement was presented at the annual meeting of the McKinley-Darragh, January 31, showing a total silver recovery for the year, valued at $1,426,856, and net profits of $983,043. The ore reserves were estimated at $6,041,500 tons. The net profit per ounce is 37c., as against 28.08c. the previous year. The annual meeting of the Hargraves company took place February 8. The statement there made showed receipts of $71,148, and expenditures of $58,800. The cash balance on hand was $48,620, and the value of ore in stock and at the smelters was $37,612. The production during the year was 625 tons of ore of a gross value of $117,400.

There is some agitation favoring the renewal of the iron and steel bounties, particularly the bounty on steel rods, which expires in June next, the others having already terminated. An impetus has been given to the movement by the proposed reciprocity agreement, the steel interests urging that their position will be adversely affected thereby. The president and manager of the Dominion Steel Corporation have been in Ottawa in conference with the Government. Though no official announcement is made, it is anticipated that their mission will have a successful issue, as in view of the struggle over the reciprocity measure, the Government naturally wishes to conciliate as many interests as possible. Important developments this year in the Western coal mining industry is anticipated, owing to the construction of a railroad into the Brazeau coalfields. This area, which comprises about 50,000 acres, is situated at the head-waters of the Brazeau, McLeod, and Pembina rivers, about 130 miles west of Edmonton, and about 50 miles south of the main line of the Grand Trunk Pacific railway. A branch line is under construction to connect the coalfields with the main line, and it is expected that before the end of the season the work will be accomplished. The coal is stated to compare favorably with Pennsylvania coal, and occurs in veins of uniform depth and extent. Three veins thus far discovered have a depth of 27 ft., with about 10 in. of slate interspaced as layers. As there is a large area to the east to be supplied, the mines will have a ready market for any possible output, and they will probably be a genuine rival to the Crows Nest of southern Alberta and British Columbia.

NICARAGUA, CENTRAL AMERICA

A Commission Investigating Concessions to Foreigners.— The Mining Exploration Co. and Oroya.—Iniquitous Provisions.

David Arellano, a lawyer of Nicaragua, who was educated at Fordham University, and David Moffat, formerly United States Consul at Bluefields, are members of a commission appointed by the Nicaraguan Government to investigate concessions made to foreigners. Under the Zelaya régimé it is claimed many concessions were granted in the names of dummies, in the interest of Zelaya and his henchmen. Among these are banana concessions to the Bluefields Steamship Co.; others were for control of navigation. Two mining concessions which were acquired after Zelaya was deposed were by the Mining Exploration Co., controlled by Minor Keith and A. Chester Beatty, and by the Oroya Exploration Co., the latter known as the Irias concession. Whether the latter two will be deemed valid seems questionable, as both contain provisions which would tend to stifle the mining industry in that country. The Irias concession gives exclusive right for 10 years to locate mining claims, a total area of 20 square kilometres, after which the concession holds for 50 years, giving the owners free import of mining supplies during that period, regardless of any changes that in the future may be enacted in the laws of the country. The concession bought by the Mining Exploration Co. gives control over all minerals, ores, coal, oil, and precious stones that may be found in the valleys of the Siuma and Matis rivers, and that of Bambana to its junction with the Bana Cruz, and all tributaries to their sources, the boundaries being 2½ kilometres on each side of each stream and tributaries. The latter company had this concession under option two years ago, and turned it down. According to information received, the purchase price was greatly reduced from the figure at which it was originally offered, and the company is said to be depending on its ability to influence the present Nicaraguan Government to enable it to hold the concession. William Adler, main owner of the Siempre Viva and Topaz mines in Nicaragua, was recently sentenced to serve six years in the Atlanta, Georgia, penitentiary, on account of questionable banking transactions at New Orleans. He is said to have borrowed money from one of the banks of which he was president, putting up as collateral a large number of shares in the Siempre Viva company. Mr. Adler was prominent in Central American affairs and had various interests there. It is learned from a director of the Oroya Exploration Co. that a man named Nobbs has gone from Mexico to Nicaragua to take charge of the Babilonia mine, recently acquired by that company at a price stated to be $110,000. H. B. Kaeding has left San Francisco to become manager at the Siempre Viva mine.

JOHANNESBURG, TRANSVAAL

Gold Output.—Randfontein Consolidation.—Alluvial Mining.

The gold output of the Transvaal for the month of December has been declared at 640,995 oz. of a value of £2,722,775. The output of the province for 1910 amounts to a total value of £32,001,735, of which the Witwatersrand has contributed £30,703,912. The Rand's yield in the previous year was £29,900,359; the whole of the Tranvaal producing £30,925,788. The December output of the Southern Rhodesian gold mines has not yet been announced, but the output of that country for 1910 may be estimated at practically the same yield as the yield for the previous year, namely, £2,623,709. Taking into account one or two producers in Natal, Cape Colony, and Northern Rhodesia, the gold output of British South Africa for 1910 may be approximated at £35,000,000.

At the moment the two features of most vital interest to Witwatersrand mining are the absorption of the mining interests of the great South African house of Wernher, Beit & Co. by the Central Mining & Investment Corporation, Ltd., and the proposed consolidation of the Randfontein South and Randfontein Central mines. For the past half a dozen years the keynote of Transvaal mining policy has been concentration. Whereas at the conclusion of the Boer War there were many scores of companies' claims, syndicates, and mines in various stages of development; there are at the present time not more than five dozen different mining concerns of first-rate importance operating on the Witwatersrand, and it is clear that before the end of the present decade consolidation will have been carried out to such an extent that a dozen mines will account for 85 or 90% of the production of the entire Main Reef field. The transfer of the Wernher-Beit interests to the Central Mining & Investment Corp. appears to have been advised mainly in order to secure provision for the efficient administration of the firm's affairs in the years to come. Sir Julius Wernher—the Grand Old Man of South African mining—makes no secret of the fact that he is getting up in years and that in all probability the time is not far distant when it will be impossible for him to devote the energy to the manifold interests of his firm that he has cheerfully given in the past. Some few years ago Wernher, Beit & Co. formed a powerful trust to acquire and regulate many of their holdings. That trust was the Central Mining & Investment Corporation, and at this juncture it is only fitting that the sphere of the concern's usefulness should be increased and the other interests of Wernher, Beit & Co. taken under its protective wing. The holdings which the corporation will take over are valued at about £1,250,000. With the consummation of this project the familiar name of H. Eckstein & Co. will practically disappear, although happily for the Witwatersrand the able lieutenants of the firm who have done such a tremendous amount for the mining industry in South Africa are not to be lost to us. Messrs. Lionel Phillips and Raymond W. Schumacher will remain as managing directors of the Central Mining & Investment Corporation in Johannesburg, with Messrs. H. C. Boyd and E. A. Wallers as managers. L. Reyersbach, who was for long the able chairman of Rand Mines Ltd., is, I understand, to direct the affairs of the organization in London. Other motives have prompted the Randfontein directors to urge on shareholders the advisability of amalgamating the two great subsidiary companies controlled by Sir Joseph Robinson. The prime reasons for amalgamating the Randfontein Central and Randfontein South mines are given as follows: (1) less capital outlay necessary for increasing the crushing capacity of the plant; (2) increase of ore reserves; (3) additional security against shortage of native labor. The ore reserves in the two mines are given at 6,055,076 tons of an average assay value of 6.9 dwt. per ton, of which 5,325,130 tons average 7.45 dwt. The South Randfontein mills have been at work for years past, but the new 600-stamp battery of the Randfontein Central has not yet been started. The combined capacity of the two plants as at present constituted is 3,100,000 tons per annum. The general opinion here is that the admittedly unsatisfactory state of the situation with regard to unskilled labor has been the primary reason that has induced the directors to advise amalgamation of the two vast properties.

Hitherto alluvial mining in South Africa has proved a distinct failure. It is true that in the 'early days' of Transvaal gold mining several decent sized fortunes were made at Mac-Mac and Pilgrim's Rest in the northeastern portion of the province, but of recent years work of this nature has given poor results. It is interesting and gratifying therefore to learn that in the Kaap Valley (Barberton district of the eastern Transvaal) experiments have recently been carried out which point to the probability of alluvial gold in this valley being worked at a profit if scientific and up-to-date methods are introduced and a certain amount of assistance is afforded the scheme by the State. Up to date a matter of £350 only has been expended on the scheme and already valuable experience has been gained. The Government cannot be charged with extravagance in the matter, and one or two of the South African papers are agitating for the continuance of the experiments on a larger scale, with a view to finding a solution, or at any rate partial solution, for the distressing problems connected with the 'poor whites' in South Africa. This evil is an ever present one, in fact an increasing element in the affairs of the Union States, and any experiments which appear to point to a remedy, whole or partial, should be followed up to the best of the State's ability. For these reasons the preliminary results secured in the Kaap Valley are of much importance.

GOLDFIELD, NEVADA

Bullion From Consolidated Mines Co.—Efficiency of Refinery.— Estimate of January Output. — Florence Goldfield Operations for 1910.

A recent shipment of gold bullion to the Selby Smelting & Lead Co. by the Consolidated Mines Co., weighing 23,660 oz. avoirdupois, was 0.900 fine and is worth about $18 per oz. Heretofore the bullion shipped by this company graded about 0.350 fine, and the higher degree of fineness of that now produced has been rendered possible by the completion of the new refinery. Four years ago a shipment of ore was made from this mine which still holds the record for highest value of a single consignment. This was a carload of 48 tons from the Hayes-Monnette lease on the Mohawk, in payment for which the lessees received from the Selby company a check for $574,958. The report of January operations has been delayed owing to the absence of the secretary and treasurer of the company, but it is reported on apparently good authority that the production will be greatly in excess of that in December, and may not fall short of $1,000,000 gross. In the mines, development continues with satisfactory results on the deeper levels and in new territory, and the new work from the Grizzly Bear shaft, south of the Clermont, is getting close to the Clermont vein and in the vicinity of the Clermont ore-shoot on the 1160-ft. level. According to present plans the ore, when opened on the deepest level from the Grizzly Bear, will be taken out through the Clermont shaft, which is connected with the Grizzly Bear shaft on two levels. On the 600-ft. level the Red Top vein is being explored from the Laguna shaft, and drifts from the Clermont at this depth are now in unexplored ground. The official report for December operations shows net profits of $447,294.67 from 25,500 tons of ore treated, the gross value of which is given at $752,409, with total costs of $10.25 per ton. The sum of $65,044.63 is charged off for construction, and a footnote explains that this item includes all amounts expended for construction to date.

The Florence Goldfield Mining Co., in its annual statement gives the following figures for the year ended December 31, 1910: Cash on hand December 31, 1910, $92,318; revenue from bullion and concentrate, $586,539; interest and rentals received, $3306; miscellaneous income, $1820; total debit, $683,983. Operating expenses, $320,799; marketing expenses, $47,053; general expenses, $22,130; taxes, $6650; materials and supplies, $1860; dividends paid, $105,000; total credit, $503,492. Less deductions from capital

accounts, $3215, leaving $500,277. Balance on hand December 31, 1910, $183,707. The annual meeting of stockholders of the Florence company will be held at Goldfield March 1, and will be immediately followed by a meeting of the directors. It is not probable that a dividend will be declared, as the payment of 10c., the established rate, would leave too small a fund in the treasury. The Florence main shaft has reached a depth of nearly 700 ft., where another station will be cut; and development is in progress on the 600-ft. level, where an ore-shoot was opened by a cross-cut driven 40 ft. from the shaft, the ore assaying about $70 per ton. The mill is treating from 130 to 150 tons per day, with a reported improvement in the mill-heads.

NEW YORK

Condition of Metal Market.—Congressional Inquiry.—The Calumet & Hecla. — Merger of Bisbee Mines to be Effected. — Davis-Daly, Porcupine, and Ohio.—Ray Central.—San Toy. — Zinc Smelters.

Those who are the chief factors in the metal market realize the necessity for such an organization as will be able to outline and carry through a program of curtailment that will check overproduction of copper, conserve resources, and stabilize the metal market. On the other hand, the necessity for careful action is shown by the introduction of a resolution in the lower House of Congress providing for an immediate investigation of the relations now existing between the Anaconda Copper Mining Co., the Amalgamated Copper Co., and the United Metals Co. If the resolution be adopted, the Attorney General will be directed to make an investigation to determine whether the companies named are doing business in violation of the Sherman Act. While the intimate relations existing between these concerns are known to all who are at all conversant with affairs in copper mining, it will probably be found eventually that instead of there being any violation of law the three are in fact one, in point of ownership. The resolution is not important, except to make it plain that any copper merger, or any effective working organization must be first approved by the Washington authorities, or it will be branded as an outlaw and robbed of any usefulness it might possess for correcting present conditions. The present move probably is due to the rumor that the United Metals Selling Co. is to be eliminated and its copper selling contracts turned over to the Anaconda. The truth is that the Federal authorities are perturbed by the drift of affairs in copper, the centralization of interests which has come about largely as a matter of self-preservation. The recent investigation into the timber situation has revealed a state of affairs of much the same nature. Conservation of natural resources has been made a political issue, and, as it means the railroad, banking, and financial interests on the one side, and the reformers and champions of popular rights on the other, the issues so raised are not, frankly, welcome ones. As to the most important one of the copper consolidations now forming, that of the Calumet & Hecla, there may be some obstacle to overcome before it is allowed to go through. The opposition of the Boston interests seems to have been overcome. The report of the Boston Stock Exchange committee says: "We believe that the directors of the various companies have made an exceedingly thorough and honest effort to find a just basis of consolidation, that the principles of arriving at these valuations are correct, and that whereas many of the factors can not be exactly determined, we believe on the whole, that the valuations reached are equitable and that each and every detail has been given due consideration. In conclusion, your committee has come to the unanimous conclusion that the plan is conceived with absolute intent toward fairness and is as fair a plan as could be produced under existing conditions." In a letter to Quincy A. Shaw, the president of the Calumet & Hecla, the committee recommends that the new holding company be given a larger capitalization than has been contemplated. On the present basis of market value that new stock would sell for something like two hundred dollars per share, which would make a unit rather unwieldy for any shareholders who might care to go in and out of the market speculatively. The copper country people know the mines and the markets thoroughly, and the Boston houses that command this patronage value it highly. As against the smoothing away of objections in Boston, the Calumet & Hecla merger has met with a serious setback in Michigan. Thomas L. Chadbourne, of Houghton, was for many years general counsel for the Calumet & Hecla, and is an Ahmeek holder, owning about 3000 shares of stock, which he does not want to exchange on the basis proposed, as he says he can only do so at what he believes will be a heavy loss to him. Mr. Chadbourne has addressed a circular to all of the shareholders of the various companies asking them to refrain from voting, "which," he says, "is as effectual as voting against the merger." He charges that the Ahmeek property was undervalued and also says that he will immediately have introduced into the Michigan legislature a bill providing, as is now the law in several other States, that shareholders must be paid in cash, if they prefer, instead of being forced to take stock in a new company. While the local authorities say that the proposed tonnage tax bill will not become a law in Michigan, Mr. Chadbourne can undoubtedly succeed in having the law he proposes passed, if he desires.

The consolidation of the Calumet & Arizona and the Superior & Pittsburg is assured by the receipt of proxies, covering 130,000 shares out of 200,000 total of the Calumet

Butte, Montana.

& Arizona, to be voted in favor of increasing the capital to $650,000 and absorbing the Superior & Pittsburg. The latter company's shareholders have until April 1 to turn in their stock and render effective the plan to declare a dividend of 87c. per share. The Davis-Daly stockholders are still after F. A. Heinze, and are trying to learn by what right he used Davis-Daly assessment money in purchasing claims in Porcupine. The protective committee, consisting of three members of the Boston Stock Exchange, has been provided with a treasury fund with which to make a fight, and when Mr. Heinze returns from Porcupine he will have a chance to make good on his promise to give the New England holders a majority of the Davis-Daly board and the executive committee. The Davis-Daly assessment money has been loaned to the Ohio Copper Co.; $50,000 said to be secured by $80,000 of Ohio Copper bonds, which, by the way, are almost unsalable in the open market. Twenty thousand dollars has been expended in Alaska, one-half of this sum for options on properties and one-half for examinations and reports by engineers. The Foster property in Porcupine, supposed to have been purchased by Heinze, now appears to have been acquired for the Davis-Daly company, or at least with Davis-Daly money; $25,000 having been paid upon the option and the company bound to pay a total of $200,000. Mr. Heinze is reported as intending to make a public flotation of the Porcupine property, which, if successful, would probably result in the money being returned to the Davis-Daly treasury, less one-third of the profits derived from the transaction, to accrue to Mr. Heinze personally. The Alice Gold & Silver, one of the oldest

of the Butte mining companies, is to be dissolved and its assets distributed among the shareholders. The meeting of the directors of the Ray Central Copper Co. was to have been held this week, but was postponed on account of the absence of some of the members of the board. The long expected report of Frank H. Probert, of the firm of Weed & Probert, is now promised definitely within a week or two.

The advance sheets of the report of the San Toy Mining Co. for the past year has been mailed to the shareholders. The net profits for the year were $157,566. The report is not so favorable as was that of a year ago. The value of the ore was considerably lower and operating costs proportionately higher. San Toy is supposed to be controlled by Charles M. Schwab, and the public has always been inclined to favor the issue, but the showing has not been good enough to keep up the enthusiasm. The situation in the zinc-smelting industry is said to have determined the American Smelting & Refining Co. to erect a zinc smelter at Nuevo Laredo, on the Rio Grande, opposite Laredo, Texas. The anticipated early exhaustion of the gasfields in and about Chanute and Iola, Kansas, has rendered it imperative that new smelters be erected elsewhere in some district where cheap natural gas can be made available. In the present plans there is included the laying of a pipeline from Reiser, Texas, where a new gasfield has been developed, to Laredo, some 28 miles, and thence across the Rio Grande to the new smelter, and possibly later to be extended to Monterey. The erection of a zinc smelter is expected to prove a great impetus in the development of the zinc ore deposits of northern Mexico.

DENVER, COLORADO

Proposed Legislation.—Progress in Cripple Creek.—The Motter Process.—Cokedale Disaster.—Curtailment at Leadville.

Four years ago there was a law proposed which would establish drainage districts in all the mining camps of the State. The same proposition is again before the legislature. The object of this proposed law is to make it possible to collect the necessary funds from all the companies benefited by a drainage tunnel. The experience of those who backed the Newhouse tunnel at Idaho Springs, and of those who financed the Roosevelt tunnel at Cripple Creek, shows how grudgingly some companies and some individual owners will contribute money only when public sentiment can be invoked against them. Surely it is not right for a few generous companies or individuals to be forced to pay entirely for a tunnel which will benefit others who are simply a drag on the industry. On the other hand, if the bill should be passed without careful consideration and provision for the financially weak operators in a district it may act as the proverbial last straw. Another bill before the legislature is one to authorize the State to tunnel the continental divide, between Tolland and Arrow, at a cost not to exceed $500,000. Those most interested in this measure are showing commendable energy in suggesting the numerous ways in which such an enterprise might prove a paying investment for the State. There is some doubt, however, about the rich veins of ore to be cut by the proposed tunnel, and of the millions of acre-feet of water that would be a yearly source of revenue.

The rumor that the Golden Cycle mine at Victor and the mill at Colorado City have been sold is at last officially dead, and now there is much speculating as to whether the 18-mile aerial tram from the mine to the mill will be built. Estimates have been received by the Cripple Creek Deep Drainage Co. on the length and cost of another tunnel to drain the camp 500 ft. deeper. The directors of the company are awaiting developments from the cross-cut from the present tunnel to the C. K. & N. vein. Should ore be found in this vein at the tunnel level, everybody will be much encouraged. It would seem to be the part of wisdom to prospect rather extensively from the present tunnel level before starting on a project which will cost upward of $1,000,000. The management of the El Paso mine has issued a statement that all leases will be renewed at their expiration on May 1. The company will insist that all assaying be done at the mine and that insurance be carried by all men underground. A change room is to be established by the company for the use of the lessees and their employees. This is in line with the action of the Golden Cycle company some time ago.

If the monthly report of the samplers is an index of conditions, the mines in the Clear Creek district are more active than last year at this time. The Malm dry chlorination process, which promised so much for the district a year ago, is still only a hope. To add to its troubles a competitor has entered the field. The Colorado Metals Extraction Co. has secured a long-time lease on the Lowell mill at Idaho Springs, where it intends to establish the Motter process. As far as can be learned this process does not embody any new features. It is adapted to the treatment of mixed sulphide ores. The finely ground ore is subjected to a roast at a low temperature for the purpose of converting all the silver and copper and some of the iron to sulphates. These are recovered from the solution as silver chloride, metallic copper, and iron sulphate, by the ordinary methods. The residue is re-ground, and after passing over the amalgamating plates is concentrated. The lead, zinc, and iron are separated from each other by magnetic separators.

Students at Colorado School of Mines Ready for Training in Rescue Work Under J. C. Roberts of U. S. Bureau of Mines.

On February 9 an unusual accident happened at the Cokedale mine of the Carbon Coal & Coke Co., near Trinidad. In some manner the car of powder in charge of the shotfirers became ignited. Fifteen miners and two rescuers were overcome by the after-damp. This is one of the model mines of the State, and the accident illustrates the fact that mining, even with the best preventive equipment, is extra hazardous. The Leyden mine, a short distance northwest of Denver, is to be reopened. This mine was wrecked by an explosion and fire which caused the shaft to cave in last December. The new shafts are to be lined with concrete so that they will remain open, whatever happens. This is a very sensible construction and should be made a necessary requirement for all coal mine openings in the State.

Leadville has passed quickly from the height of joyous celebration to the depths of despair. The Western Mining Co., a subsidiary of the A. S. & R. Co., has closed all its zinc-producing mines in the camp indefinitely. This has thrown about 200 men out of employment. It must be admitted as good business on the part of these large holding companies to let the lessees and small operators supply the market as long as they will at a figure that admits of no profit and to market their own ores on a rising market. The rich placer ground in French gulch near Breckenridge is now involved in litigation. Englishmen interested in placer properties with B. S. Revett are now demanding a settlement. The present hearing will last at least sixty days.

General Mining News

ALASKA

JUNEAU DISTRICT

The report of the Alaska Treadwell Gold M. Co. for the month ended January 15, 1911, is as follows: Mill time, 31 days. The 240-stamp mill ran 29 days, 11 hr., 43 min.; water-power, 6 days, 2 hr.; steam-power, 23 days, 9 hr., 43 min. The 300-stamp mill, water-power, ran 9 days, 15 hr., 50 min. The former crushed 32,732 tons, and the latter crushed 16,296 tons; total, 49,028 tons of ore. Concentrates saved by 240-stamp mill, 635 tons; saved by 300-stamp mill, 330 tons; total, 965 tons of concentrate. Estimated gross value of free gold, $78,381.44; estimated gross value of concentrate, $49,818.93; total, $128,200.37. Estimated total realizable value, $122,275.27. Operating expenses, $82,059.16. Net operating profit, $40,216.11; construction expense, $18,248.11. Yield per ton of ore milled, $2.61; stock of ore broken, 20,865 tons. Development work, 1023 ft.—228 ft. in ore, 795 ft. in waste. Assay-value of ore in new work, $0.66 to $4.96 per ton.

The report of the Alaska Mexican Gold M. Co. for the month ended January 15, 1911, is as follows: Mill time, 31 days. Mill of 120 stamps ran 29 days, 17 hr., 34 min.; water-power, 4 days, 1 hr., 56 min.; steam-power, 25 days, 15 hr., 28 min. Ore crushed, 18,129 tons; concentrate saved, 390 tons. Estimated gross value of free gold, $33,704.82; estimated gross value of concentrate, $34,660.87; total, $68,365.69. Estimated total realizable value, $65,746.77; operating expense, $33,209.33; net operating profit, $32,537.44; construction expense, $4072.05; yield per ton of ore milled, $3.77. Stock of ore broken, 8929 tons; development work, 506 ft.—235 ft. in ore, 271 ft. in waste. Assay-value of ore in new work, $2.13 to $3.16.

Report of the Alaska United Gold M. Co. for the month ended January 15, 1911, is as follows: Mill time, 31 days. Ready Bullion 120-stamp mill ran 29 days, 17 hr., 36 min., by steam-power. The 700 Ft. Claim 100-stamp mill ran 29 days, 17 hr., 27½ min.; water-power, 2 days, 7 hr., 19 min.; steam-power, 27 days, 10 hr., 8¼ min. The former crushed 19,628 tons of ore, and saved 365 tons of concentrate; the latter crushed 15,471 tons of ore, and saved 295 tons of concentrate. Estimated gross value of free gold, $20,947.91 in Ready Bullion, $16,348.99 in 700 Ft. Claim mill; estimated gross value of concentrate, $15,957.80 in former, $14,071.24 in latter mill. Estimated total production, $36,905.71 in Ready Bullion, $30,420.23 in 700 Ft. Claim; total realizable value, $34,767.46 in former, $28,702.72 in latter. Operating expenses, $27,652.89 in former, $24,683.07 in latter. Ready Bullion net operating profit, $7114.57; 700 Ft. Claim profit, $4019.65. Construction expense, $1971.84 and $2238.99, respectively; yield per ton of ore milled, $1.88 in former, $1.96 in latter. Development on Ready Bullion, 432 ft.—272 ft. in ore, 160 ft. in waste; assay-value of ore, $2.64 to $3.22; development on 700 Ft. Claim, 291 ft.—232 ft. in ore, 59 ft. in waste; assay-value of ore, $0.27 to $2.72. Stock of ore broken, 2875 tons in former, 13,139 tons in latter.

ARIZONA

GILA COUNTY

The Montgomery mine, situated in Globe district, and operated by the Warrior Development Co., mined and shipped 39,042 tons of ore between October 14, 1909, and December 31, 1910.

GREENLEE COUNTY

The Twin Peaks M. Co. is employing 60 men at its gold mine, situated 13 miles from York station, on the A. & N. M. railroad. The Clear Lake mine is being developed with a force of 15 to 20 miners, under direction of C. M. Fairham. A considerable tonnage of ore has been hoisted, which is to be hauled to Sheldon and shipped to the smelter.

PINAL COUNTY

(Special Correspondence.)—The directors of the Ray Central were at Ray last week, and will recommend in their report to the stockholders that several churn-drills be installed to prospect the hitherto unexplored portion of the property. That section already developed contains, according to the estimate of Weed and Probert, 6,500,000 tons of ore.

Ray, February 14.

CALIFORNIA

CALAVERAS COUNTY

The new 3-compartment shaft being sunk at the Lightner mine, Angels Camp, has reached a depth of 345 ft., and cross-cuts have been started at the 200 and 300-ft. stations to connect with other cross-cuts leading to the principal orebody. A tramway is being built from the new shaft to the mill. The stamp batteries are being overhauled, and it is intended to have 20 stamps operating by March 1, and 20 more a few weeks later.

INYO COUNTY

The interest aroused in the Villareal camp by the operations of the Domingo M. Co. has been increased by recent discoveries of lead-silver ore in that district by John Beauregard of Laws. He made the find by sinking through a lava capping into lime-shale and quartzite in which the ore occurs. He is mining ore of a grade that will stand shipping. In this vicinity are the claims recently located by Massey and Sheehan for George S. Nixon of Nevada. The Domingo company keeps up ore-shipments from its Villareal mine, but is letting no leases. The camp is about 12 miles from Keeler.

NEVADA COUNTY

(Special Correspondence.)—The winze from the 700-ft. level of the Pennsylvania is being sunk. Shaft-sinking continues and the orebody is showing up well; 15 stamps are in action. The San Francisco owners of the Union Hill have decided to replace the old mill with a modern 20-stamp plant. The unwatering of the property will soon be commenced, and a small force of men put to work. The North Star Mines Co. has a small force of men at work in the Champion mines, completing the drift from the Champion to the Nevada City workings. Meanwhile the Champion company continues to operate the property along normal lines, with usual developments progressing. At the Delhi the sinking of the shaft is progressing steadily. The recent break in the flumes, caused by the heavy snow, has been repaired. The Gaston mine has partly recovered from the effects of the recent storm, and a portion of the stamps are again in action. It is reported that development will be resumed at the Murchie mine. The Sacramento people, who recently became interested, are keeping the pumps in action, and expect to commence activities as soon as certain claims against the property have been adjusted. A small crew is employed at the Golden Gate, and some good ore is reported. W. P. Martin is superintendent. The North Star Mines Co. is having work done at the Cincinnati Flat group. The recently installed hoist is greatly facilitating developments. The Tidal Wave gravel mine near North Bloomfield has been leased to A. M. Hotchkiss and associates. The bedrock adit is being re-opened to tap the extension of the noted Derbec gravel-channel.

Grass Valley, February 13.

SAN BERNARDINO COUNTY

The Mohave Mines Incorporated, controlled by people in the East, has purchased the Mohave mine, situated near Silver mountain. The property embraces five claims, on which are veins of low-grade, free-milling gold ore. The purchasers, it is said, are to erect a 40-stamp mill and lay a 3-mile pipe-line to conduct water to the property from the Mojave river.

SIERRA COUNTY

(Special Correspondence.)—Despite the heavy snow in this district, which has caused damage to flumes and ditches, as well as to mine-buildings, several companies are keeping up operations to the normal. The Croesus Mining Co. is developing the Plumbago mines, and extract-

ing good ore from the main adit workings. Charles W. McMeken is superintendent. At the Gold Canyon a small crew is employed and good ore is being opened. Operations have been resumed at the German Bar group by the Buck brothers of Moore's Flat. The adit is being extended to pick up the vein lost by the old company. The upper workings of the Tightner will soon be re-opened and the shaft sunk deeper. It is stated that the last shipment of bullion by the Tightner company amounted to $33,000. A 3-ft. vein of gold-bearing quartz is being opened in the Nonpareil. Reno capitalists are interested. The Andy Fitz Mining Co. has placed a contract with a San Francisco firm for a 10-stamp mill for the Fruitvale mine. Concentrators will also be installed. Reserves of good ore have been opened. At the Sixteen-to-One driving is progressing on the lode. A second pay-shoot is being sought. The Alleghany Channel Mining Co., of Pennsylvania, has a rich gravel deposit in the Gold Star. L. W. Jennings is superintendent. The recent snowslide at the Telegraph failed to do as much damage as reported. No sheds were destroyed, and only a part of the power-line was damaged.

Alleghany, California.

Operations are again in progress. There is no truth in the report that the Keystone mill has been destroyed by a snowslide. At the Sierra Buttes, operations have been resumed. A lower adit is being driven at the Columbo to open the vein 150 ft. deeper.

Alleghany, February 10.

The Oriflamme, on Lafayette ridge, Alleghany district, is being developed under direction of C. C. Ward, who is having a cross-cut driven to intersect three veins. This cross-cut is now in 540 ft.; at 414 ft. from the portal a vein was opened, and by drifting north thereon a shoot of ore was found containing free gold and gold in sulphide. The cross-cut is being extended farther, with the expectation of cutting another lode. Later in the year, it is thought, a sufficient tonnage of ore will be available to justify the building of a mill to treat it. A 6-ft. channel of gold-bearing gravel was opened lately on the property of the Deadwood Consolidated, situated in Poker Flat district. This company, composed of San Francisco and Los Angeles men, has the Deadwood, Reese Ravine, and Sebastopol under bond and lease. Development has been in progress for nearly a year under direction of A. B. Call.

TUOLUMNE COUNTY

(Special Correspondence.)—Los Angeles investors have become interested in the Mastodon aud California mines, on the Mother Lode, and preparations are under way for commencing operations. A pump is being installed on the Mastodon, and an engine, boiler, and hoist have been leased from the Longfellow mine. The shaft is 115 ft. deep, at the bottom of which the ore is of good grade. It is reported that Lester R. Wiley and others are to take a bond on the Nonpareil mine, in the Groveland district, and will begin operations at an early date. A promising new vein has been discovered on the Santa Ysabel, to the west of the shaft, and the ore at the surface is said to be richer than any yet worked at that mine. The vein can be tapped at depth by driving a cross-cut from the shaft, and this will probably be done. A residence that will cost approximately $10,000 is to be erected at the Tarantula mine for J. G. Crawford, manager for the United Gold M. & M. Co., which operates the property. The lumber, which comes from Oregon, has been delivered at the mine. It is reported that operations were resumed at the Draper mine, near Soulsbyville, on the 20th inst. The Springfield Tunnel & Development Co. is installing three new transformers on its property at Springfield. The owners of the Snell mine, situated near American Camp, have entered into an agreement with Edward H. Scott for the sale of the property. The early resumption of operations at the Mazeppa mine is said to be assured.

Tuolumne, February 22.

COLORADO

CLEAR CREEK COUNTY

(Special Correspondence.)—A 3-in. streak of ore has been opened in the east drift on the Unicorn vein that assays 600 to 700 oz. silver per ton. Hurley & Co. have leased a block of ground on the Aetna, and they have a 5-in. streak of ore that assays 3 oz. gold and 15 oz. silver per ton. The east drift on the Aetna vein, intersected by the Capital adit 4600 ft. from the portal, will be driven 700 ft. farther. Holcombe & Co., leasing on the Aetna vein at the bottom of the 50-ft. shaft, have purchased an electric hoist, and shipments will be started next week. The Hite M. Co. is developing the White claims on Columbia mountain. The adit is to be driven to intersect the lodes. The output from the Santiago mine, East Argentine, now averages one carload per day, the average value of the ore being $40 per ton in gold, silver, and lead. The Central Capital mine on Griffith mountain is receiving attention. Shipments of lead-zinc ore will be started next spring. A body of ore, 12 to 18 in. wide, has been found on the Mint property, on Covode mountain. The stuff mills from $40 to $45 per ton in gold. The Conqueror M. & M. Co. is increasing its working force and will start its 50-ton concentrating plant as soon as sufficient water is available. Ore-shipments are being sent out from the Gold Fissure mine to the Golden smelter. It samples from $25 to $30 per ton. Willis Bristol is manager.

Georgetown, February 13.

(Special Correspondence.)—The Lowell mill at Idaho Springs is to be equipped with the Motter process of ore extraction. It is claimed by those interested that all of the metals can be separated, thus doing away with the smelting cost. O. W. Lowell is manager. Ore has been opened on the Bride vein, on Seaton mountain, which assays from $60 to $65 per ton in gold and silver. Hoban & Oxley are operating under lease. Work was resumed last week on the Gold King claims, on Saxon mountain. Operations, carried on through the Eclipse adit, are in charge of W. O. Robinson. Work has been started at the Scepter adit on Democrat mountain. This property was recently taken under bond and lease by M. D. Draper, the bond calling for a payment of $125,000. If the result of development prove satisfactory, it is probable that a milling plant will be constructed.

Idaho Springs, February 12.

GILPIN COUNTY

(Special Correspondence.)—The Coaley M. Co. has been organized to take over the Coaley group, in the Enterprise district. The 200-ft. shaft is to be sunk 200 ft. deeper. Ore was mined years ago that ran as high as $1000 per ton in gold and silver. Six tons of ore sent out last week from the Perigo mine sampled 2.52 oz. gold and 2 oz. silver per ton. The shaft on the Topeka mine has reached a depth of 1400 ft., the last 100 ft. having just been completed. A station is being cut at this depth, and driving will be started on a 3-ft. vein. An orebody 3 ft. wide, averaging $9 per ton, is opened on the 900-ft. level, and ore is being shipped to the Iron City mill.

Emmett Tuck is operating as lessee. The Gilpin-Eureka M. Co. installed a heating plant and is again operating. Simpson & Co., leasing on the Old Town, last week shipped 23,480 lb. of ore that sampled 5.41 oz. gold, 7.2 oz. silver, and 3.5% copper. Pike & Co. sent out 33,400 lb. that milled 2.90 oz. gold, 6 oz. silver, and 2.4% copper. The 500-ft. shaft on the Chase mine is to be sunk to 700 ft., as was announced by Forbes Rickard, consulting engineer for the operating company. The shaft on the Cashier is nearing the 100-ft. point. Machine-drills are in use, and sinking is progressing at the rate of 2¼ ft. per day. A level is to be driven from the 100-ft. station, after which sinking will be resumed. W. Auger is manager. The Gilpin-Valdez M. & R. Co. will erect a 10-stamp mill in the Alaska district. The plant will do custom work. W. H. Bishop is manager.

Central City, February 14.

LAKE COUNTY

The Mount Champion M. Co. owns what was formerly the Theodolite group of mineral ground on the eastern slope of Mt. Champion, just above the Half Moon amphitheatre. It is claimed that the development of the last year has exposed 30,000 tons of ore, grading $12 to $50 per ton, its principal value being in gold, which may be recovered mostly by amalgamation. The plans of the company contemplate the construction of a gravity tramway 6500 ft. in length over which to convey the ore to the base of the mountain, where a stamp-mill and hydro-electric power plant are to be built. The Miller Gold M. & T. Co. owns property on the west slope of this mountain, which is being developed; a mill and tramway, previously commenced, are to be finished this season. The zinc buyers, who bid for Leadville zinc-carbonate, have made up a new schedule for treatment charges, under which it is claimed the zinc producer receives only $8.80 per ton for ore containing 30% zinc, whereas under the old schedule they received $11.30 per ton for ore of that grade. The change has aroused the mine operators, who are to meet and consider their interests.

PITKIN COUNTY

The shaft of the Free Silver mine, at Aspen, has been unwatered, and mining on the lower levels of the Mollie Gibson and Smuggler mines is to be resumed. Three high-capacity electric pumps, installed at the 1200-ft. station of the Free Silver, are expected to keep the lower workings of these properties practically free of water, and driving from that station toward the orebodies has been commenced.

SUMMIT COUNTY

The Wellington Mines Co., operating a zinc mine and mill, announced from its Kansas City office a dividend of $50,000, payable February 20.

IDAHO

SHOSHONE COUNTY

(Special Correspondence.)—Bunker Hill & Sullivan Mining & Concentrating Co. brought its total dividends up to $12,456,000 by the payment of dividend No. 161, amounting to $81,750, a few days ago. In the Hecla mine, at Burke, the discovery of a 14-ft. vein of profitable ore was made on the 1200-ft. level, a fact that removes all doubt as to the wisdom of deep development on this property. Jas. F. McCarthey is manager for the Hecla M. Co., which owns the mine.

Kellogg, February 10.

MONTANA

BROADWATER COUNTY

(Special Correspondence.)—A meeting of the Ohio-Keating Gold Mining Co. is to be held March 21 to consider leasing the property to a number of miners until December 31 on a 25% royalty basis. The board of directors has already approved of the plan. The mine is situated in the Radersburg district and has been closed down for some time; electric power is being substituted for steam. Under the terms of the proposed lease the company and lessees are to use the shaft jointly. A bond issue of $50,000 was authorized recently, and the capital stock was increased from 500,000 to 800,000 shares. The ore exposed in the shaft is identical with that now being mined in the property of the Keating Gold Mining Co., which has been shipping about 2100 tons of ore per month, of an average value of $24 per ton.

Radersburg, February 17.

SILVER BOW COUNTY

The quarterly report of the North Butte company shows that extensive development has been carried on. The Speculator shaft is now down below the 2600-ft. level, and it is to be continued to a depth of 2800 ft. A pump is being placed on the 2600-ft. level. The raises under the Granite Mountain shaft have been completed and these connections have greatly improved the ventilation in the stopes of the Edith May vein. A large amount of work has also been done in the Edith May, Jessie, South Gem, South Croesus, and North Croesus veins. A portion of the report is devoted to an explanation of the settlement of the dispute between the company and the Tuolumne, it being explained that such a course was necessary owing to a wrong impression having been printed, to the effect that the company conceded to the Tuolumne all of the Jessie vein except about 400 ft. at the west end of its property. Mr. Pope, the general manager, then explains the agreement and says that the settlement establishes ownership by the North Butte company to all the ore which has been developed or worked in the Jessie claim for a full length of close to 1100 ft. and does not affect the orebodies of the company or the mining operations in the least. Mr. Pope concludes with the statement that the compromise is a substantial recognition of the rights of both companies and is of mutual advantage. The East Butte company is gradually increasing its smelter business, and each month finds an addition to the amount of custom ore being received. It has been found necessary to start a second furnace to handle all the ore and at the same time treat the ore received from the company mines, although the output from the latter has not been increased. In the old Pittsmont mine development work is being done on an extensive scale, and bodies of ore are being blocked out. The management believes the ore will continue to run from 6 to 8% copper.

NEVADA

ESMERALDA COUNTY

The Columbus Florence American Leasing Co. has a 15-months lease on the Florence Extension in Goldfield, belonging to the Florence American M. Co. The leasing company was incorporated by Clyde Hill and Corrin Barnes, whose financial backers are at Columbus, Ohio. The Combination Fraction Mines Co., operating in Goldfield, had a gross income of $96,314.82 during 1910, principally from ore mined and milled. It had $44,744.44 on hand at the beginning of that year. Expenses, equipment, development, mining, and milling for the year amounted to $145,371.53. The Sandstorm-Kendall Con. Mines Co. has been organized to further develop and operate the Sandstorm-Kendall mines at Goldfield. C. D. Wilkinson and William Campbell are manager and superintendent, respectively. Those having the Precious Metals lease on Atlanta ground, Goldfield district, are developing at a depth of 730 ft., expecting to cut into the Florence vein. The Queen Con. lease, also on the Atlanta group, is active again, the plan being to explore from the 705-ft. level. Sinking is to be continued till a depth of 1500 ft. is reached.

HUMBOLDT COUNTY

W. G. Adamson and associates, in developing a property on the north slope of Winnemucca mountain, five miles from the town of Winnemucca, have opened a mineralized dike, 50 ft. wide, through which gold ore of milling grade is disseminated. Within the dike was found a 10-in. streak of ore said to assay $1000 per ton.

LYON COUNTY

S. S. Arentz, superintendent for the Nevada-Douglas Copper Co., operating the Nevada-Douglas and Ludwig mines in Yerington district, is reported as stating that

all stations have been completed to water-level in the Ludwig shaft, and that pumps are to be installed at the lowest station; that 59 mine-cars have been ordered and a new 150-hp. electric hoist has been shipped, and that a 150-ft. tramway is to be built from the top of Douglas hill to the railroad track. The Mason Valley Mines Co., owner of the copper mine near Mason, has a force of 125 men at work constructing the smelting plant at Wabuska. The concrete work is about completed, and the steel construction will soon be commenced.

MINERAL COUNTY

By enactment of the State legislature, the county of Mineral has been created. The new county embraces what was formerly the northern part of Esmeralda, and the principal towns are Rawhide, Hawthorne, and Mina. It is announced that the Black Eagle company has purchased the King-Heisner mill, at Rawhide, the Huntington mills in which are to be replaced by stamps. Cyaniding equipment is to be provided, and an air-compressor is to be installed.

NYE COUNTY

Loftus and Davis, who control the Gold Bar property, 10 miles from Rhyolite, are reported as having decided to spend no more money on it, and they may move the 10-stamp mill to Round Mountain, and add the equipment to their mill at that place. Lessees on the Big Four mine brought gold and silver bullion of the value of $40,000 into Tonopah last week. This was recovered from ore taken from the 225-ft. level. It is said to have averaged $100 per ton. The property is on Gold hill, Manhattan district.

NEW MEXICO

GRANT COUNTY

(Special Correspondence.)—The Savanna Copper Co., operating in the Burro mountain district, 13 miles southeast of Silver City, has a copper property which is developed by seven shafts having an average depth of 300 ft. There are four miles of underground workings. Of

Map of New Mexico.

the 7 hoists in use, 3 are operated by steam, and 4 by gasoline engines. Present work is confined to exploration with two Star churn-drills on the northeast portion of the property. Drilling for the last 11 months has been continuous, and the result has been satisfactory. There are 43 drill-holes, averaging 664 ft. in depth, mostly in porphyry through which copper is disseminated. Drilling is to be continued to determine the limits of the ore zone. Within the next month the company intends to resume underground development. I. J. Stauber is the company's manager. The Comanche mill and smelter, formerly operated by the Comanche M. & S. Co., are in good condition, and the mill, especially, may be of use in concentrating. Chloride Flat, adjoining Silver City on the southwest, contains lime and iron deposits, which could be used as flux for the smelter. The iron contains some silver.

Silver City, February 10.

The property of the Hermosa Copper Co., in Santa Rita district, has been taken under bond by the Indian Copper Co., an organization controlled by the Gunn-Thompson company. The Hermosa adjoins the Chino, and has been extensively developed. There is said to be 100,000 tons of ore exposed in the workings.

SOCORRO COUNTY

The Mistletoe M. Co. has erected and set in operation a 50-ton plant for dry concentration at Kelly. Its ore consists of lead carbonate and zinc, containing from 4 to 8% lead. A concentrate is obtained that will sample about 47% lead. The plant cost $20,000. The Lynchburg mine in the same district is under bond to the American Zinc & Lead Co., which has made a payment of $5000 on the purchase price. It is probable that other dry-concentrating mills will be erected in Kelly district. The Tri-Bullion M. & D. Co. is operating its mine and mill, the latter being equipped with tables suitable for separating lead from zinc and iron; also a magnetic separator.

OREGON

BAKER COUNTY

The White Swan, now called the Susan D. mine, situated east of Baker, is under bond to C. F. Sodering and others of Spokane. In driving from the bottom of a 122-ft. shaft a vein was opened containing 2 ft. of high-grade ore. Operations have been resumed on the Virtue mine, situated in the same locality. The Imperial property, in Cable Cove, is being operated again by E. R. Davidson, of Spokane. It is stated that he will soon ship ore to the Sumpter smelter. The Oroville Dredge Co. has acquired a considerable area of placer ground at Sumpter which is adaptable for dredging. Development is going on at the Ben Harrison with a force of 25 miners. A cross-cut is being driven to open the vein 250 ft. lower than the present working level. The property is in the Greenhorn district.

JOSEPHINE COUNTY

The Deep Gravel mines, situated in Waldo district, have been sold to Eastern people who have organized the Waldo Con. Gold M. Co., in which title to the mines is vested. O. A. Turner is president of the company; Frank M. Leland is general manager. The same company has acquired the Osgood, and the Simmons-Cameron-Logan placers. The Deep Gravel is equipped with 6000 ft. of hydraulic pipe, 4 giants, having heads of 150 and 200 ft. A shaft sunk to bedrock on the lower end of the property is 122 ft. deep, the gravel containing gold and some platinum.

The Scandinavian-American Dredging Co., for which P. H. Holdsworth is manager, is moving a dredge to the Argo property, and is expected to be ready to operate in a few weeks. A carload of equipment has been received by the Rogue River Dredging Co. for use in rebuilding its dredge.

TEXAS

(Special Correspondence.)—The mining men of this State are making an effort to get the enactment of a law governing the location and development of claims upon State lands. A bill has been introduced in the legislature with this object in view—in the Senate by Claude B. Hudspeth, of El Paso, and in the House by A. M. Turney, of Alpine. Mr. Hudspeth has also introduced a bill providing for the establishment of a State School of Mines and Metallurgy, which shall be separate from the mining department of the State University, at Austin. The bill provides that the proposed school shall be built at El Paso. In effect the mineral lands measure provides that persons prospecting State or school lands for precious minerals may, within one year after filing affidavit of claim, work the land, and

if mineral is found no more than the amount necessary to pay the prospector's reasonable expenses may be taken away, but the claimant may purchase the land any time within the year, giving his note for the unpaid balance of purchase price, bearing 3% interest annually, and depositing in the State Treasury one-fifth of the purchase price. Thereafter, in addition to the interest on his note, the purchaser must pay annually to the Treasurer one-fifth of the cash price until the sum of $1500 an acre is paid. The nineteen sections of this bill provide for regulations also as to State lands worked for all baser metals; land bearing oil or natural gas being fixed for sale at not more than $25 or less than $10 per acre if within five miles of an operated railroad; otherwise to be sold at $5 per acre. The bill for the School of Mines and Metallurgy provides that its establishment shall be conditioned on the city of El Paso deeding to the State a tract of not less than 20 acres to be selected by the Governor and Superintendent of Public Instruction. The school is to be under the supervision of the regents of the State University and all subjects pertaining to mining and metallurgy will be included in the curriculum. The institution is designed to be self-supporting, all money received from tuition and other sources to be returned to the State annually in repayment of the appropriation of $15,000 that the bill carries with it.

Austin, February 6.

UTAH

JUAB COUNTY

The Chief Consolidated, for 1910, received $177,639.12 for ore sold and expended $63,078 for hoist and equipment; $111,190.77 was the cost of mining and development. During the year 6947 tons of ore was shipped, which yielded 440 oz. gold, 433,850 oz. silver, 525,552 lb. lead. The net value of the ore was $25.57 per ton. The principal part of the development performed was on the 1400-ft. level. The work was divided as follows: Shaft-sinking, 118 ft.; driving, 3044 ft.; raising, 328 ft.; winzes, 526 ft.; a total of 4016 ft. for the year. Ore shipments from the mines of Tintic district run from 140 to 156 carloads per week; for the week ended January 27 they were as follows: Dragon mine, 23 cars; Iron Blossom, 20; Sioux Con., 6; Colorado, 6; Brookiyn, 2; Grand Central, 8; Gold Chain, 4; Centennial Eureka, 46; May Day, 2; Uncle Sam, 6; Ridge & Valley, 3; Iron King, 3; Opohongo, 2; Chief, 2; Gemiui, 3; Scranton, 4; New Bullion, 1; Tintic Smelter, slag, 3; total, 146 cars.

The Yankee Con. M. Co., owning the Yankee mine at the north end of Tintic range, during 1910 raised $89,929.50 by assessments, and received $23,200.62 from other sources. The expenditures for the year amounted to $79,461.56, there being a balance January 1, 1911, of $10,388.96. The mine work accomplished during the year consisted of 485 ft. of shaft-sinking and 4000 ft. of driving for exploration and development purposes. In the meantime, new shaft equipment has been supplied. B. N. Lehman is, and for several years has been, the company's manager. The directors are John E. Du Boise, J. E. Frick, B. N. Lehman, H. C. Edwards, and C. J. North. The Dragon mine produced 4000 tons of ore in January. The mine is in charge of L. E. Riter.

PIUTE COUNTY

The Shamrock Gold M. Co., operating near Marysvale, shipped two cars of ore in January. W. J. Wolstenholme is in charge and employs eight miners. An adit, now in 1000 ft., is being driven on the Gold Bullion, controlled by Springville men.

SALT LAKE COUNTY

It is announced that a 3-compartment interior shaft is to be sunk from the Utah Con. company's No. 7 haulage level, to aid in the more economical development and extraction of ore below that level. There is now a 250-ft. incline which starts on this level at a place 500 ft. from the portal; but the new shaft is to be farther in, near the centre of the mineralized area, and will be sunk to a depth of 300 ft. This work is the beginning of operations in undeveloped ground. A station is being cut out for the collar of the shaft. The heading of the adit which the Bingham Copper Co. is driving in Bingham district has intersected a second fissure-vein containing 18 in. of galena ore of good grade.

Werner Ziegler, having a lease on the old Winnemucca mill in Bingham canyon, has the plant in successful operation on custom copper ores, consisting mostly of low-grade stuff from various mine dumps.

SUMMIT COUNTY

Ontario lessees are mining and marketing ore and developing in new ground. The old Ontario mill is to be so remodeled as to make it a modern plant, when it will be operated on ore mined by the lessees. The new mill at the Little Bell mine, Park City district, has been closed by reason of an insufficient water-supply.

PHILIPPINE ISLANDS

Australian investors, who control the Rio Chico Gold Dredge & Mining Co., have acquired 100 acres of placer ground on Rio Chico and Rio Cahu, in Nueva Ecija district. Tests made by boring in this field indicate 18 to 52c. gold per cubic yard. A dredge is to be built for this work. In the Paracale district, a dredge being built for the Gumaus company is expected to be ready for work by next August. The dredge operating on ground of the Philippine company recovered 73 oz. gold in 11 days operating in November. The Paracale Gold Dredging Co. is operating one dredge and may erect another this year. This company has installed a stamp-mill in which to crush the gold-bearing boulders. Shipments of 135 tons of concentrate and 125 oz. of gold and silver bullion were sent out from the San Mauricio mine at Mambulao in November.

CANADA

BRITISH COLUMBIA

(Special Correspondence.)—The Hercules M. & S. Co., composed principally of Spokane men, has acquired and is to develop the Reco, Trachyte, and Buffalo claims on Copper mountain, situated 15 miles south of Princeton. In the group are said to be three fissure veins, on one of which is a 4-ft. vein of copper ore. Those interested comprise N. S. Pratt, Peter Hoogenbaezem, R. H. Hughes, J. E. McCauley, Andrew Anderson, and R. L. Sheppard. It is claimed considerable money has been spent on development.

Princeton, February 17.

(Special Correspondence.)—A discovery of 6 ft. of steel galena, assaying 170 oz. silver per ton, has just been made on the 1000-ft. level of the Rambler-Cariboo mine. Another find of importance was made in the Standard mine, Silverton. The No. 6 tunnel, the heading of which has been in concentrating ore for some distance, now has 2 ft. of galena ore of shipping grade, though it is more than 100 ft. from a point vertically under the beginning of the ore-shoot opened on No. 5 level. The width of the vein on No. 5 level is 41 ft. at its widest point. Much of this ore is suitable for concentrating, though there is a strip of silver-lead ore near the foot-wall over 4 ft. wide that will assay 65% lead and 90 oz. silver per ton. Two gold bricks were shipped from the Nugget mine last week valued at $8000. This was the result of 26 days run of the 4-stamp mill. Ore is being shipped from the Molly Gibson mine of the Consolidated company over the new tram line, which has a length of over 4½ miles. The shipments of ore and concentrate from the Slocan-Kootenay district for the week ended February 11 amounted to 5114 tons.

Nelson, February 18.

(Special Correspondence.)—The Consolidated company has placed the Phoenix Amalgamated on a producing basis, and shipped 380 tons of ore to the Trail smelter last week. Operations are also continued at the Snowshoe. This concern may build a cyanide plant at Boundary Falls to treat the ore from the No. 7 mine. The ore shipments from the Boundary district for the week ended February 11 aggregated 40,377 tons.

Phoenix, February 15.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

W. J. Lorino is in London.

E. W. Parker is in San Francisco.

Edmund Juessen has gone to Portland.

Edward J. O'Connell has been in San Francisco.

W. H. Hutchinos is in charge of the Ohio mine, Pearl district, Idaho.

R. B. Lamb, of Toronto, Canada, is in Porcupine, on professional business.

F. K. Boyd is mill superintendent for the Seguranza Mining Co., Zacualpam, Mexico.

G. A. Denny is consulting engineer for the Julieta mine, at Almoloya, Chihuahua.

R. H. Channing and S. A. Lewisohn visited Virginia City, Nevada, on February 12.

Robert N. Bell is again State Inspector of Mines for Idaho, after an interim of two years.

C. B. Lakenan, manager for the Nevada Consolidated Copper Co., was at Salt Lake last week.

A. L. Queneau has opened an engineering office at 929 Chestnut street, Philadelphia, Pennsylvania.

Lee Mantle, of Butte, Montana, has purchased the Jack Waite lead mine, situated near Murray, Idaho.

Kirby Thomas, who spent several weeks in Alamos district, Sonora, Mexico, has returned to New York.

R. B. McGinnis left San Francisco for Brazil, by way of New York, on February 18. He expects to return in August.

Emerson Gee is at the Minas Del Carmen, in the district of Juquila, Oaxaca, Mexico. He will return to Los Angeles March 1.

M. J. Heller, consulting engineer for the Consolidated Arizona Smelting Co., Humboldt, Arizona, was at Pioche, Nevada, last week.

W. H. Landers, superintendent for the Standard Con. Mg. Co., at Bodie, California, is in San Francisco to attend a meeting of the company.

W. J. Thomas has resigned as superintendent for the Seven Troughs Coalition Mining Co., which office he has held for the last three years.

Frederick J. H. Merrill has opened offices at 624 Citizens National Bank Bdg., Los Angeles, for consulting practice in geology and mining engineering.

C. H. Repath, who designed the International smelter at Tooele, Utah, is at Douglas, Arizona, designing some construction work for the Calumet & Arizona company.

F. W. Solomon, assistant superintendent of the concentrator of the Steptoe Valley Smelting & Mining Co., has been appointed superintendent of the concentrator of the Miami Copper Company.

Chester W. Washburn, having finished the examination of Mexican oilfields for S. Pearson & Sons, Ltd., has gone to London. From there he will go to Buenos Ayres to investigate the possibilities of finding oil and artesian water in the western Argentine States.

George Q. Palmer, formerly vice-president, has been made president of the Alberger Condenser Co. and the Alberger Pump Co. Mr. Palmer is succeeded as vice-president in the Alberger Condenser Co. by D. H. Chester, and in the Alberger Pump Co. by W. S. Doran.

The Geological Society of London will this year award its medals and funds as follows: The Wollaston medal to Prof. Waldemar C. Brögger, Sc.D.; the Murchison medal to Mr. Richard H. Tiddeman, M.A.; the Lyell medal to Dr. Francis A. Bather, M.A., and Dr. Arthur W. Rowe; the Bigsby medal to Dr. O. Abel; the Wollaston fund to Prof. O. T. Jones, M.A.; the Murchison fund to Mr. Edgar S. Cobbold; the Lyell fund to Prof. Charles G. Cullis, D.Sc., and Mr. John F. N. Green.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

MINING—LIENS FOR LABOR AND MATERIAL

The procurement of the carbonaceous mineral commonly known as mineral coal, by digging in the earth is termed 'mining'; and the term 'mine' or 'deposit yielding metals or minerals of any kind,' used in the statute of Oregon giving laborers and material-men a lien for the working or development of any mine, lode, mining claim, or deposit yielding metals or minerals of any kind, has been held to include a coal mine, although the term 'mining claim' as used in such statute may not do so.

Escott *v.* Crescent Coal & Navigation Co., (Ore.) 106 Pac. 432. Jan. 1910.

STATE REGULATION OF MINING LOCATIONS

A State may add to the regulations made by Congress for the location of mining claims; but such State regulations must not be inconsistent with those adopted by Congress. And a failure to comply with the State laws and rules will work a forfeiture whether such laws and rules provide for forfeiture for noncompliance or not, and the mining claim becomes subject to re-location by any qualified locator. Such statutes are said to be mandatory and substantial compliance with their provisions are necessary to perfect a valid location.

Knutson *v.* Fredlund, (Wash.) 106 Pac. 200. Jan. 1910.

LOCATION OF MINE—SUFFICIENCY OF NOTICE

The statute of Washington requires a lode discoverer to record in the county auditor's office within a certain time a notice containing the name of the locator, the date of the location, the number of feet in length claimed on each side of the discovery, the general course of the lode, and such a description of the claim by reference to some permanent monument as will sufficiently identify it. In a controversy arising under a notice of a lode location under these statutes, it was held that location notices which did not designate the point of discovery, or state the number of feet in length claimed on each side of the location, or the general course of the lode, or identify the claim by reference to some natural monument, were insufficient; and in an action to recover possession of such a claim it was also held that an amended notice of location which did not cure the defects in the original notice was not proper evidence.

Knutson *v.* Fredlund, (Wash.) 106 Pac. 200. Jan. 1910.

LOCATION OF MINING CLAIM—EFFECT OF FAILURE TO WORK

The statute of Montana requires performance of the following acts in order to constitute a valid quartz lode mining location: (1) discovery of a vein or lode; (2) the posting of a notice of location at the point of discovery containing certain designated matters; (3) the marking of the boundaries on the ground, and the doing of certain development work; (4) the filing for record of a declaratory statement containing the matters mentioned in the statute. Under this statute the failure, among other things, to perform the designated work will forfeit the location. But no one but the Government, or a subsequent locator, can complain of a failure on the part of the original locator to do the necessary annual work, and a subsequent locator is not in a position to make complaint until he himself has completed a valid location; and if prior to the completion of such valid subsequent location, the original locator has resumed work upon his claim in good faith, he thereby saves his claim from such forfeiture and such subsequent locator can take no advantage of such delinquency. And in all actions or controversies for the forfeiture of mining claims the rule is that every reasonable doubt will be resolved in favor of the validity of a mining claim as against any effort or action of forfeiture.

Thornton *v.* Kaufman, (Mont.) 106 Pac. 361. Jan. 1910.

Book Reviews

Any of the books noticed in this column are for sale by, or can be procured from, the MINING AND SCIENTIFIC PRESS.

COMMERCIAL HANDBOOK OF CANADA FOR 1911. By Ernest Heaton and J. B. Robinson. Pp. 540. Index. Seventh edition. Toronto, 1911.

This annual has become a necessity to those having commercial interests in or with Canada. It contains a vast amount of information conveniently arranged in concise form. It also gives much needed information relative to the development of the natural resources of the Dominion, such as mining, lumbering, farming, manufactures, transportation, commerce, and a great many other things, including various tables which are always useful for reference. Price $1. Postage 10c. Heaton's Agency, Toronto, Canada.

DESCRIPTIVE MINERALOGY. By E. H. Kraus. Pp. 332. Ill. George Wahr, Ann Arbor, Michigan, 1911. For sale by the *Mining and Scientific Press*. Price $2.75.

This is a complete and well prepared volume on descriptive mineralogy, the usual sections on the determination of minerals by means of the blow-pipe and on the optical properties of minerals having been omitted. Blank pages for notes are interleaved, making a rather bulky volume. Of the making of books there is no end, and authors do not always feel the necessity of presenting a reason for adding to the already bulky literature of the subject. Presumably in this case it is the presentation of mineralogy in a form better adapted to student needs than the 'big Dana,' while retaining the Groth classification. The less scientific classification by bases seems better adapted to the teaching of mineralogy to mining and civil engineering students. Presumably this volume is intended as a textbook for such students, but it is difficult to understand how time can be spared in an engineering course for so extended a treatment of only a portion of the subject of mineralogy. The illustrations in the book are confined to diagrams in the text, so that it is somewhat lacking in this regard, but the paper and press work are good.

T. T. R.

METALLURGY OF LEAD. By H. F. Collins. Second edition, revised and enlarged. Pp. 538. Ill., Index. Chas. Griffin & Co., London, 1910. For sale by the *Mining and Scientific Press*. Price $6.

This is a revised and enlarged edition of the valuable work which first appeared in 1899. So much new material has been added in bringing it up to date that, in addition to increasing the page size, the present volume contains 170 more pages than the first edition. Advantage has been taken of the opportunity to rearrange the chapters so that the presentation of the subject is more logical. The author calls attention to the fact that the two best known texts on the metallurgy of lead are national in character and expresses a desire to make his own cosmopolitan. This, the second edition, may fairly claim to be, though the first scarcely attained the desired ideal. The excellences of the work are so many that their enumeration would require much space, so that a commendation of the description of blast-roasting, of the more advanced discussion of the principles of smelting, and the more complete description of a modern plant and of present-day practice, and especially of the much more complete and better chosen list of examples of lead smelting practice throughout the world, must suffice. There are new chapters on electrolytic refining and flotation processes and recent improvements in the collection of flue-dust are described. By omitting matter that is of little present importance Mr. Collins has made the first step toward the production of an ideal text on metallurgy, one where lengthy descriptions of archaic methods are omitted and a full description of the uses and applications of the metal in question is given. It is quite the best presentation of the metallurgy of lead which we have as yet.

T. T. R.

COMMERCIAL PARAGRAPHS

The Edgar Allen American Manganese Steel Co., has moved its general Eastern sales office to New Castle, Del., one of the manufacturing plants of the company.

The Joshua Henuy Iron Works of San Francisco was the first concern to reserve space for an exhibit at the Panama-Pacific International Exposition, to be held in San Francisco in 1915.

The General Engineering Co., Salt Lake, has added a second story to its building, moved its offices and drafting-room to the second floor, giving double its former floor-space for the ore-testing plant. A cement-testing department has been added to the business of the company.

The Sullivan Machinery Co. announces the opening of a branch office at Spokane, Washington. Austin Y. Hoy will be in charge. Announcement is also made that Howard T. Walsh has been appointed manager of the London office and that J. C. West comes to the Pacific Coast as manager of that branch.

Herman Nieter, who was formerly New York agent for the Hammond Iron Works and later sales manager for the Canton Boiler & Engineering Works of Canton, Ohio, has recently been appointed general sales manager of The Kennicott Co. of Chicago. The Kennicott Co. is prepared to handle all kinds of steel-tank work as applied to mining plants, oil refineries, and water-works. It also manufactures water softeners.

The Wedge Mechanical Furnace Co. has been organized to take over the furnace business of the Pennsylvania Salt Manufacturing Co. The officers of the new company are the same as the old, with the exception of Utley Wedge and Leslie H. Webb, who have been added to the furnace company's staff. The sales of the Wedge furnace have been increasing very rapidly during the last year, and it is a significant fact that the first sale has almost always led to further orders.

Among the growing industries on the Pacific Coast are those represented by the Leona Chemical Co., with offices in the Albany building, Oakland, California. The Leona Chemical factory in Oakland started several years ago the manufacture of sulphuric acid, and the raw material from which it is made is procured from mines which this company owns and operates at Leona Heights. With sulphuric acid as a base, the manufacture of other commercial acids, such as nitric, muriatic, etc., was soon taken up, and then followed the production, one by one, of such industrial chemicals as are used in the arts and manufactures about the bay cities. Alum and aluminum sulphates are being made for use in the manufacture of paper and paints, also in the preparation of leather and as a mordant for dyeing. It is used in large quantities in winter, for purifying and clarifying water. It is made from bauxite with sulphuric acid. Barytes and other salts of barium are produced in large quantities for use in the manufacture of mineral paints, pottery, glass, and sugar refining. The crude baryte ore comes from large deposits which this company owns at El Portal, the entrance to the Yosemite valley, whence it is shipped to Oakland for grinding and refining. The finished product is a fine, impalpable white powder, and has become in such demand that the Leona company plans to erect a large mill in the future, for grinding the ore and manufacturing other salts of barium. Electrolyte is another of this company's prominent products used entirely for storage-battery purposes. This is an especially pure sulphuric acid. The Leona quarry, situated in the hills of Oakland, at Leona Heights, was opened 20 years ago and has been in continual operation since that time. The rock quarried is a hard, clean, blue trap rock, particularly well adapted for both concrete and macadam purposes. During the past year and a half, the operating machinery has been completely changed, the old plant having been torn down and new and large equipment installed, having a daily crushing capacity of over 1500 tons. The rock is quarried by glory-holes, from the base of which it is fed directly into cars hauled by electric locomotives out of a tunnel to the crushers. The rock is automatically dumped from the cars into the crushers and is conveyed down the hill by means of a 24-in. rubber belt-conveyor over 1800 ft. to screens on the bunkers at the foot of the hill. The company has its own power-plant, consisting of three double-cylinder Doak gas-engines which were manufactured in Oakland. These develop 450 hp. to drive the generators, compressors, machine-drills, crushers, conveyors, and screens. The crushed rock is delivered at the bunkers to the California railway, which has direct shipping connections with the Southern Pacific, Western Pacific, and Santa Fé railroads and also with the Oakland Traction and Key Route systems, thus giving varied and far-reaching outlets for the products. The officers of the Leona Chemical Co. are F. M. Smith, president; Wm. L. Locke, vice-president; Dennis Searles, secretary; Roland L. Oliver, general manager, and Harry P. Stow, general superintendent.

Lap-welded pipe may now be obtained in sizes larger than 30 in. The American Spiral Pipe Works of Chicago is now making lap-welded pipe from open-hearth flange-steel from 55,000 to 65,000 lb. tensile strength, in sizes from 12 to 72 in. diam. After the pipe is welded, it is again heated in a large annealing-furnace and thoroughly annealed, thus removing any strains that may have occurred during the process of making. Test-bars cut from the welded seam show the weld possesses remarkable strength, and in many tests the strength was in excess of 60,000 lb. per square inch. In a test-bar cut from the welded portion of 20-in. pipe, ¼ in. thick, the metal broke under a strain of 62,520 lb. per square inch at a short distance outside of the weld, while a bar cut from the same pipe away from the welded seam stood 60,370 lb. per square inch. However, the makers do not claim the welded seam to be stronger than the material from which the pipe is made, but do claim to be making a weld which will average close to the maximum strength of the plate from which the pipe is made, and a weld which enables them to use the best grade of flange-steel of 60,000 lb. tensile strength. A length of 24-in. inside diameter pipe, ¼ in. thick, was tested for fatigue of the metal, to see if the weld would weaken under repeated strains. The pressure was brought up to between 900 and 1100 lb., nine different times, the pipe showing no signs of fracture, although it had bulged out 1¼ in. diam., stretching the metal about 4 in. Finally on the tenth test, a small fracture occurred near the weld. As the internal diameter of this pipe was then 25¼ in., the strain on the metal was in excess of 55,000 lb. per square inch. A length of 20-in. inside diameter pipe, ¼ in. thick, was crushed in a hydraulic press for the purpose of testing the welded seam. Although the seam was badly folded together, it remained perfectly tight under water-pressure. It may be of interest to note that the total end-pressure required to crush this pipe was 565,000 lb. The pipe is used for high-pressure hydraulic lines, condenser piping, compressed air, and in places where severe duty is required.

TABLE OF CONTENTS

EDITORIAL

JAPANESE laborers continue to return to their home country, figures for 1910 just made public, showing an excess of 3899 in the arrivals in Japan, over America.

OIL MEN in California are rejoicing over the passage by the Senate at Washington of the remedial legislation already passed by the House and designed to allow perfecting of title to lands under dispute.

GOLDFIELD CONSOLIDATED in January earned $552,627, according to the report issued last week. The gross output, from 27,192 tons milled, was $798,177; the tailing ran $2.03; net recovery $27.32. Development amounted to 4004 feet and is said to have yielded satisfactory results.

PHOSPHATE deposits have been entered under both the lode and placer laws and there has been no final decision as to which form of entry is correct. The House at Washington passed last week a bill providing that in case of conflict between locators under placer laws and the lode laws, the respective rights of the claimants should be determined as though location under either law was valid at the time the entry was made. This will clear away some existing conflicts but the main matter remains undetermined.

SPELTER production of the United States in 1910 amounted to 269,184 short tons, while consumption was 245,884, according to figures prepared by Mr. C. E. Siebenthal of the U. S. Geological Survey. Apportioned according to the source of the ore, 140,651 tons came from Missouri; 23,238 from Colorado; 20,952 from Wisconsin; 20,217 from New Jersey; and smaller amounts from other States. Kansas led in smelting, with 105,697 tons, while Illinois produced 73,038, and Oklahoma 34,760. The year was one of increased production and decreased consumption.

INDUSTRIAL safety is to be promoted by a new society which has taken the name of 'The Industrial Safety Association.' The mining industry is appropriately represented in its control with Mr. Philip T. Dodge on the board of managers and Mr. Charles Kirchhoff among the vice presidents. The object of the society is to prevent accidents to life, limb, and body of persons engaged in productive industry, and to promote health and well being of wage earners by disseminating knowledge of sanitation and hygiene. There is evidently a large and useful field

open to the society. It is proposed to hold exhibitions of safety appliances, to furnish lectures in industrial centres, and to distribute reports, pictures, and leaflets designed to inculcate sound notions of sanitation and hygiene. The Association will depend on membership dues for funds. It deserves hearty support from mine and works managers.

STEAM-SHOVEL mining has long been in vogue in the Lake Superior district where the cheapest iron mining is done by means of steam-shovels in open pits. When the porphyry copper mines came to be opened in the West the same method was applied. Small shovels are employed underground in the Joplin zinc mines, and at Blair, Nevada, a shovel is used in mining gold ore. Generally, gold ore does not exist in large enough bodies to warrant introduction of steam-shovels, but none the less mining engineers evidently need to know more about these powerful machines. They have too long allowed civil engineers their exclusive use. Whether or not steam-shovels can be introduced to advantage is not always easily determined. Their field is limited. If the scale of work is such that only one shovel can be used, there is doubt as to their adaptability, though in the Lake Superior region they are used individually in 'milling' pits where the ore is handled underground. In large work they permit selection of material. In crowded quarters the rule works the other way. Steam-shovel mining involves more than ordering a shovel by telegraph. There are problems of trackage, of grades, of blasting, and of handling material, that are peculiar to this form of work. Some of these are discussed in this issue by Mr. E. E. Barker on the basis of experience at the Ely copper mines.

STATE CHAPTERS of the American Mining Congress are being organized. The usefulness of such chapters will depend on the character of the men who go into them, and particularly on the executive officer. The Colorado chapter is conspicuously fortunate in the men who are active in its affairs, and in its secretary, Mr. A. W. Warwick. Regular and special meetings have been held for discussion of bills introduced into the State Legislature and affecting mining. Active campaigns have been inaugurated for and against a number of bills, and there can be no doubt that much good is being accomplished. The best way to fight a bad bill is by well-directed publicity; and there are always bad bills. The best way to secure enactment of good laws is by intelligent attention to the bills introduced. Many a good cause has been lost by poor presentation, and successful campaigns can only be waged after thorough preparation. The man who sits back and does nothing but criticize deserves little sympathy if there remain a large field for his activities in that direction. Organized effort is essential to success. In California, since the practical demise of the California Miners' Association, there is no organization that can speak directly and authoritatively for the mining industry. When any law is proposed in which mining men are interested they must work for or against it as individuals. The bill that we discussed last week, proposing regulation of smelters, is one of first importance to the whole mining and chemical industry, and yet the miners' side is being presented by a few men representing corporations directly interested. However fair and able a presentation of the case these men may make, their work will be discounted in advance by their direct self-interest and the present anti-corporation sentiment. The matter is, however, one of vital import to many more than the managers of smelters and acid works, and this instance is typical of what comes up in every American State from time to time. Mining men should be fair about such things. Don't leave the corporations to fight your legislative battles and then object to 'big business' in politics.

Mineral Resources of Japan

In one of our recent issues Mr. T. Haga described some of the difficulties which have been encountered in the operation of the Imperial Japanese Iron Works at Wakamatsu, in the northwestern part of the island of Kiushu. Iron and steel constitute almost exactly one-half of the import trade of Japan in mineral products, kerosene forming about one-half of the remainder. In 1909 of a total mineral import trade of 53,328,897 yen, iron and steel amounted to 26,878,724 and kerosene 11,657,300 yen. To offset this there was a total mineral export of 43,221,316 yen, of which copper constituted 21,071,383 and coal 17,297,139 yen. This situation presents certain features of broad significance from a strategic standpoint. Iron, steel, and kerosene are so essential to the daily life of the Japanese nation that in the event of a war the greatest inconvenience would result from a blockade of commerce. The Japanese Government judged it wise to expend considerable sums in an attempt to develop domestic sources of supply. But the results attained have been most discouraging. Extensive exploration failed to discover either petroleum or iron in large enough quantities to become the basis of an extensive industry, and the iron works, which were constructed on an elaborate scale, exhibit yearly losses of discouraging magnitude, which the Government Board in charge, pressed for funds to carry out the plans for extensive development of all lines of industry, found an oppressive burden. More recently there have been signs of relief. Exploration work in Saghalien has shown the existence of petroleum deposits that promise to become important. Transport from Saghalien to Japan in tank steamers would be easy, and both Saghalien and Japan would profit if the crude oil were refined in Japan. It is hoped by the expenditure of 13,000,000 yen at the Iron Works to reorganize the business in such a manner as to compete with imported iron and steel. The ore supply is secured by a contract for a supply of ore of bessemer grade, at a low price, with the mines at Tayeh, China, and is buttressed by the recent discoveries of iron ore in Korea, which has already become a producer in a small way. From a strategic standpoint the difference between importing refined products and raw materials would seem to be exactly the same as that between tweedle-

dum and tweedledee. How adequate returns are to be derived from the sums expended on the attempts to develop these two industries in the decade past, is not clear. Nor is the export of coal to be regarded as an unalloyed benefit. The coal supply of Japan is far from inexhaustible, and the Government looked forward to the possibility of its exhaustion with grave apprehension. With the acquisition of Korea and southern Manchuria this problem has been solved, since the Fu-shun mines now produce nearly a million tons yearly, the Pen-hsi-hu are beginning to produce, and Korea has already developed a small output of good coal. These mines have been developed with capital furnished jointly by the Government and the principal colliery owners of Japan, so that the important part which these new coalfields are already taking in supplying the export trade is not a source of loss to the coal producers of Japan, the profits from the Manchurian and Korean mines more than repaying any slight decrease of profit in the operation of the mines in Japan, while the great object of conserving her resources is firmly secured.

The Belmont Mine Fire

The fire at the Belmont mine at Tonopah, Nevada, has spread a feeling of sadness throughout the world of metal mining. The story is the usual one of unpreparedness, of underestimation of danger, of prompt response to the call for volunteers, and of heroic efforts to rescue the men who were trapped. Both officers and men did their full duty to the best of their ability when once the danger was apprehended; still seventeen men are dead. 'Big Bill' Murphy made two trips with the cage through the smoke, bringing men to the surface. He went down a third time never to return. His story is the same as that of the twelve volunteers who at Cherry, Illinois, under similar conditions, lost their lives in attempting to rescue their fellows. With all its faults, human nature is a fine and noble thing; heroes are found in every emergency. The pity is that the same sacrifice must be made over and over.

In the great coal mine disaster in northern Illinois, November 13, 1909, 259 men lost their lives because of a small fire not promptly attended to, because there were no adequate means of fighting a large fire, because the men were not promptly notified, and because there was no crew trained to fight fire underground. The disaster startled the world, and in Illinois coal mines are now thoroughly equipped with fire-fighting apparatus. Metal miners have been wont to think of the great disasters as confined to the collieries. The experience at the Belmont indicates the contrary, and the accident there does not stand alone. In the nearby Comstock district stories are still told of the great and disastrous fire that once raged underground for days and cost much in life and property. At Butte, Montana, and at Jerome, Arizona, fire underground is a constant menace. Only by unceasing vigilance and excellent supervision have great disasters been avoided. But they have been avoided; and the lesson should sink deep.

The Belmont is an excellent mine, well run and well managed in every particular. At the time of the fire the men in control had taken all the usual precautions, and before criticizing them it would be well to ask how many mines are better prepared for such an emergency. The fundamental trouble is that the customary precautions are too few. It is entirely too common to extend workings from a shaft, winze, or raise, with only one outlet; to provide no control, and especially no emergency control, for ventilation; to use open lights carelessly while handling combustible material; to have no adequate water-supply or fire-fighting apparatus; and more important still, to have no trained men or predetermined system for fighting a fire. We have been in and around mines for years, but we have never seen a fire drill at any metal mine, and at but few have we learned of rules and regulations with regard to fighting fire and rescuing men. Apparatus is important, but training and plans count for more. At none of the mines at Tonopah were there helmets that the men might wear while working in the smoke, and the two sent from Goldfield were incomplete. It is probably just as well that they were, for a helmet is an element of danger rather than safety when worn by a man unskilled in its use. Mr. J. R. Williams has shown that the new apparatus requires new tactics, and the whole plan must be thought out in advance. With such a plan, with proper equipment, and with a corps of trained men, few if any lives would have been lost at the Belmont. Each mine, or at least each district, should have a volunteer crew of rescue-men, another of first-aid men, and an adequate outfit for fighting fires. Methods of handling such situations as that at the Belmont should be thought out and discussed; and a thorough system of promptly notifying the men throughout a mine in case of any accident, should be worked out at every property. The United States Bureau of Mines is doing excellent work in demonstrations and instruction along just these lines. So far its work has been confined largely to the coal mines. When the fire was discovered at Tonopah the nearest mine-rescue car was at Alma, Wyoming. Though the engineer in charge, Mr. Sumner S. Smith, made every effort, delays at junction points and elsewhere prevented his reaching the scene until Sunday afternoon. In some such case, waiting for a delayed connection may cost a score or more of lives. While he arrived too late to be of immediate service, Mr. Smith will remain and instruct a corps of men at both Tonopah and Goldfield with a view to the next contingency that may arise. This is fundamental work and should be rapidly extended. If the present Congress does not provide money for expanding this work so as to cover all mines, its leaders will be derelict in their duty.

The past is gone. For those that are dead we can do nothing, though to their relatives and friends we extend a comrade's sympathy. The future, however, remains to us, and Mr. W. H. Murphy and the others who were killed, will have died in vain if better fire protection be not provided at the mines not only at Tonopah, but throughout the West.

Stopes in Steam-Shovel Mining

By E. E. Barker

How steep a slope may be carried in the bench system of steam-shovel mining, has been the subject of much discussion. Possibly the following details of work in Nevada may be of interest to engineers having similar problems to face.

The slope of the standing bank depends upon the depth to be excavated, as well as the structure and formation of the material, so that a rule can not be formed to fit all conditions, but a general slope may be determined on which to base calculations. In the case of steam-shovel mining of the large low-grade copper deposits, the material mined is usually a variety of the so-called porphyry, which has been subjected to a leaching action, leaving the material in a very porous condition, as for example, the monzonite-porphyry of the Ely district of Nevada. In some cases, as, for example, the altered schist of the Miami district, Arizona, the material was originally much fractured, thousands of veinlets crossing and re-crossing in all directions, giving ready access to percolating waters. In both cases the porphyry when mined, especially in the sulphide zone, breaks into pieces rarely larger than six inches in diameter and more often of a size of which 50% will pass a half-inch screen, or else it crumbles directly on exposure, making the holding of a bank steeper than a slope of 1 to 1 almost impossible. In speaking of the slope ratio in this article, the horizontal will be given first, as 1½ to 1, meaning 1½ horizontal to 1, the vertical. In every case the vertical is taken as the unit. Even if the formation should be of more durable material, as would be the case in granite or limestone, the necessity for heavy blasting to loosen the banks in order that steam-shovel operations could be carried on would so shatter the walls as to prevent the standing of a bank steeper than 0.66 to 1, at most. The recent failure of some slopes of this ratio in the Culebra cut at Panama only tends to prove that, generally speaking, a slope of smaller angle is more reliable in the end. Various reasons have been given for these failures, such as surface flows, surface disintegration, or structural breaks. Since any of these may occur in any formation, the greater the reason for a slope that approaches the 1 to 1 ratio. Since the height of a standing bank is a factor in determining the slope, in the following discussion a height of 50 ft. will be taken for the vertical distance between benches. This distance has been found to be the most advisable for all purposes, including the nearness to which one shovel-cut can follow the one above, and safety in operating the machines. The blasting of this bank is usually accomplished by the springing and firing of churn-drill holes, from 8 to 12 inches in diameter, drilled on each bench by the ordinary portable churn-drill rig. With this height the shovel is seldom in danger of being buried by a slide, and with a horizontal bench

Fig. 1. Steam-Shovels at Ely, Nevada.

of 50 ft. the loading track is not so likely to be buried by the blast, thus avoiding serious and costly delays. Of course, higher banks can be carried, a height of 200 ft. or more being possible, but this would necessitate tunnel-blasting, requiring a heavy tonnage of explosives and naturally a much wider bench, so that in working by benches or terraces the reason for the rejection of this method is obvious, to say nothing of the care necessary to avoid exposing the shovel and crew to danger from a treacherous bank.

The accompanying photograph, Fig. 1, shows the shovels in operation on their respective benches with the higher one slightly in advance of the one below, thus insuring an ample width of bench for the bank when blasted. A churn-drill may be seen above the lower shovel, and the waste and ore trains are in position for loading. The cars in the right fore-

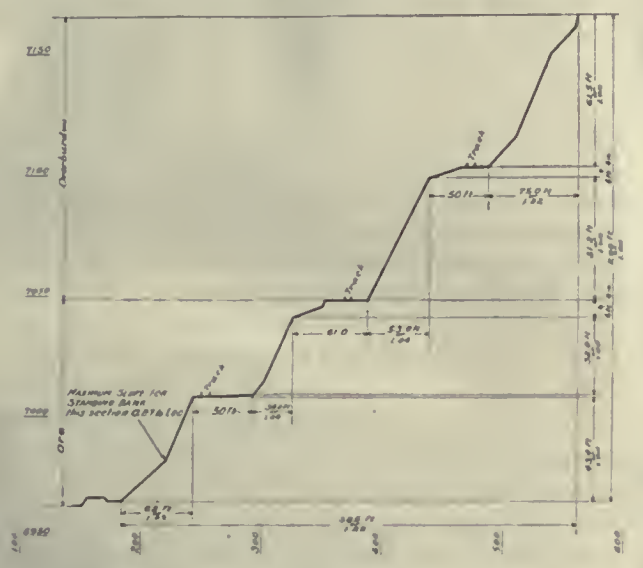

Fig. 2.

ground are loaded with ore, ready for shipment to the mill.

A study of an actual section (Fig. 2) through a bank of the steam-shovel ore-pit of the Nevada Consolidated Copper Co. at Ely, Nevada (the material being, as mentioned before, a monozite-porphyry) shows that the slope between the benches from the upper edge to the toe of the talus below, is a little greater than 1 to 1, varying between 1.04 and 1.43, or an average of 1.18 to 1. The talus, or broken material, that has become loose and has fallen to the bench below, as shown in the diagram, will always be found at the foot of a bank, the quantity varying in amount according to the condition of the standing ground. In the analysis of a steeper section, as shown in Fig. 3, the ratios of the corresponding banks are somewhat less, varying between 0.8 and 1.18, or an average for the four banks of 0.99 to 1. The steepest bank in the shovel-pit is one in the zone of sulphide ore, shown above in Fig. 3, 52.9 ft. high and standing at a ratio of 0.6 to 1. This bank is freshly cut and will stand at this ratio for only a short time, when disintegration will cause it to crumble. It will be seen, then, that an average slope for this height of bank and material will average closely the ratio of 1 to 1, a little steeper in the zone of sulphides and a little flatter in the oxidized material above.

So far the discussion has dealt with banks between the benches, not considering at all the general slope from the bottom to the upper edge of the excavation, which is the real question of moment. This ratio is, of course, much larger since the added width of the bench on which the shovel operates nearly doubles the horizontal distance. In Fig. 2 this ratio over all from the edge of the top to the toe of the bottom bench, will be seen to be 1.92 to 1, and in Fig. 3, 1.76 to 1 for four benches. With the addition of more benches the ratio will not remain the same, but will grow larger by a decreasing amount. Using the ideal section (Fig. 4), with 1 to 1 slopes, 50-ft.

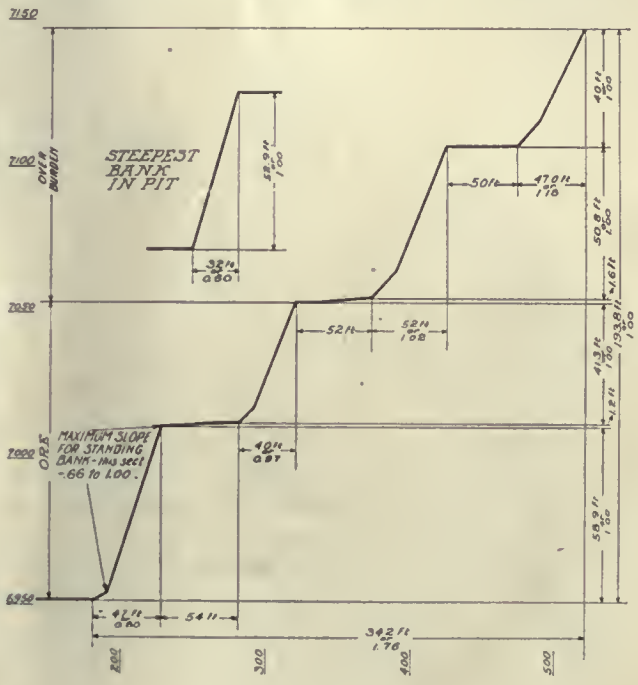

Fig. 3.

benches and 50-ft. heights, the table below will be self-explanatory and tabulates the principle.

Number of benches.	Horizontal distance.	Vertical distance.	Ratio of slope.	Difference.
2	150	100	1.50 to 1	...
3	250	150	1.66 to 1	0.16
4	350	200	1.75 to 1	0.09
5	450	250	1.80 to 1	0.05
6	550	300	1.83 to 1	0.03

From this table the formula below is deduced:

$$S = \frac{na + (n - 1)b}{nc} \text{ or, substituting}$$

$$S = \frac{4 \times 50 + 3 \times 50}{4 \times 50} = \frac{350}{200} = 1.75 \text{ to } 1$$

Let S equal the slope ratio; a equal the base of the individual slope triangle; b equal the width of bench; c equal the vertical height of bank; n equal the number of benches.

Again, with $c = 60$ ft.; $a = 50$ ft.; $b = 60$ ft.; $n = 6$, we have

$$\frac{6 \times 50 + 5 \times 60}{6 \times 60} = \frac{600}{360} = 1.66 \text{ to } 1$$

In the selection of the width of bench, the deciding factor is the slope taken by the blasted bank. Ordinary broken material will repose at a slope of about 1½ to 1, but the impetus given the broken

rock in a blast usually causes the slope to form at approximately the ratio of 2 to 1. Since the drill-holes are placed about 10 ft. from the edge and the blast loosens the ground for about 10 ft. more, the bank, when blasted, lying at a slope of 2 to 1, assumes the position of the dotted line at the top of Fig. 4, still leaving 20 ft. clear on the bench below, which gives ample room to safely accommodate the

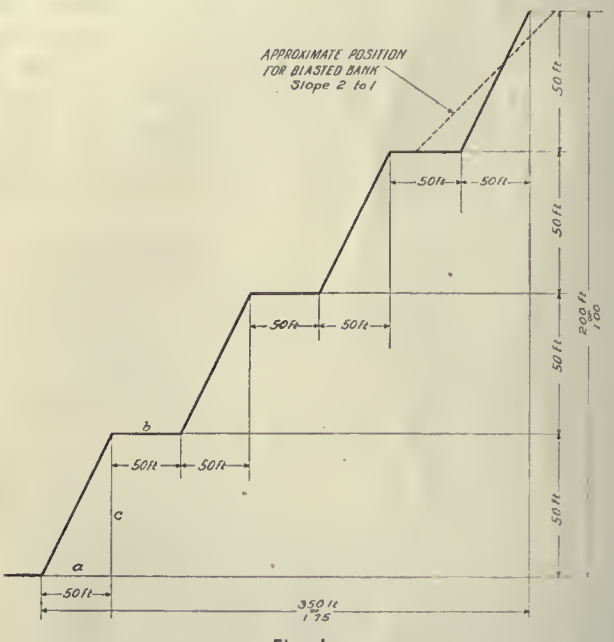

Fig. 4.

loading track without danger of being covered. From the data at hand and with conditions as given above, the section with the minimum bench and the maximum height and slope for economical operation, is the one shown in Fig. 4, with a general slope of 1.75 to 1, or a corresponding ratio for the number of terraces required.

COPPER IN RUSSIA

By S. H. Ball

In a recent interview published in the *Boston News Bureau*, Mr. Ball, who recently returned from Siberia where he investigated copper conditions, discussed conditions as below.

Copper production in Russia for the first six months of 1910 amounted to approximately 25,000,000 lb., an increase of 33%. The yield of this metal has been increasing considerably, the greatest factor being the Ural region. There are four mining regions in Russia, the Ural, Caucasus, Baikal, and Kirghese Steppes. Although the heaviest increase came from the Urals, substantial gains have also been made by the mines of the Caucasus and Kirghese Steppes. The increase in the Ural region has been due primarily to the re-starting of the Demidoffs smelter, which plant, owned by a private estate, has been closed down for two or three years. The Kyshtim Corporation has blown in two furnaces of its new smelter of the Washoe type and is treating 600 tons of ore per day. The ore assays high in sulphur and iron and the first matte carries 20% copper. To obviate further smelting a basic converter is being erected while an electrolytic refinery is already in operation. Best prices obtainable for copper are secured by this company. In all of Russia there is but one other electrolytic refining plant. The Kyshtim estate covers 2000 square miles and a railroad runs into the property. In the Kirghese Steppes there are two important mines. The Spassky mine in southwestern Siberia is one of these. It has a smelter at Spassky, a coal mine at Karagandy, and copper mines at Yuspenssky. A company railroad connects all these points. June production was 224 tons, and by now should have reached 300 tons. The shaft at the copper property is 490 ft. deep; ore runs from 14 to 18% copper. A cost of £29 per ton has been attained, and on November 10 the company paid its first dividend. Its first six months' production amounted to 2,573,172 lb., as compared with 1,760,436 in the same period of last year. The Atbaser Copper Fields Ltd. controls 28½ square miles, the greater portion of which is covered by rock of the ore-bearing series. The mine has been developed by six shafts, and ten drills are now at work. A considerable tonnage has been won and a large amount blocked out either by underground work or drills. The ore occurs either in flat or inclined sheets which are from 18 to over 8 ft. in thickness. The ore is high, averaging from 14 to 17% copper and containing from 45 to 50 oz. silver per ton. The erection of a smelter is now being considered. The company also owns valuable coal claims.

COST OF LITHIUM

The operation of amblygonite mines in South Dakota during the last two years has reduced the price of lithium carbonate from $2.50 to 50c. per pound, and large quantities have been sold at still lower prices. The carbonate is the lithium product most used, and is employed in making storage batteries and fireworks and for medicinal purposes. Lithium, the metal, has no practical use. Lithium bromide is used to some extent in photography and in medicine. In an advance chapter of the U. S. Geological Survey's volume entitled 'Mineral Resources of the United States, Calendar Year 1909,' prepared by Frank L. Hess, the occurrence and extraction of lithium ores are discussed. In 1909 several carloads of amblygonite were taken from the mines at Keystone, S. D., and a few carloads of spodumene were shipped from the same locality by another company. Practically all the lithium compounds prepared in the United States in 1909 were extracted from these ores. The pamphlet can be obtained free by applying to the Director of the Geological Survey at Washington.

Wood may be made acid and chlorine-proof by taking 6 lb. of wood-tar and melting it together with 12 lb. rosin in an iron kettle. Then stir in 8 lb. finely powdered brick-dust. The wood must be perfectly clean and dry before being painted over by the warm preparation. An even better way is to paint the surface with the warm mixture of tar and rosin, allow it to soak in slightly and then dust it over with the powdered brick. The coating must not be took thick or it will soften in hot weather.

Relation of Chemistry to Metallurgy

By Arthur C. Claudet

*Among the large number of processes that might be quoted as illustrating the debt of metallurgy to chemistry, I venture to select the following:

(1) The 'cementation', or precipitation process as applied to cupriferous pyrite at the mines in the south of Spain, and in adjoining districts of Portugal. This group of mines is traversed by a belt of cupriferous pyrite, containing 2% copper, with 46 to 50% sulphur. The processes used on the spot for the extraction of the copper belong both to chemistry and metallurgy. This is a case where chemicals are formed naturally, and in place, for the purpose of rendering the copper soluble. Briefly, the process consists in building up enormous heaps of mineral, so arranged that air can penetrate through them; water is pumped on them, and, aided by the heat of the sun, chemical reactions are set up: the copper sulphides are more easily oxidized than the iron pyrite, and are dissolved by the water. The resulting solution finds its way through the mass of the ore, and, after passing through a filter-bed of small pieces of pyrite, is led by suitable channels to precipitation-vats; where the copper is precipitated by means of pig iron, the precipitate being subsequently collected and sent to the smelting works. The pyrite heaps, after their copper content has been extracted, are sold to sulphuric acid works, whence, after burning out the sulphur, the oxidized residue is sold to iron works to be smelted. The copper precipitate is sold to the copper smelter.

This appears to be a simple process, but it has its complications. The chemist must thoroughly understand the reactions in order to regulate the cost, and to be able to produce a copper precipitate as free as possible from impurities, so that the best prices may be obtained. This requires metallurgical as well as chemical knowledge, that is, information concerning the requirements to which such products must conform at the hands of the smelter and in the market. In this process the main reactions are as follows: Oxidation is promoted by the action of the air, which is naturally warm owing to the climate, penetrating through the heaps, helped by the water percolating through them. When once the oxidation commences, considerable heat is generated; this must be carefully controlled. The copper sulphide becomes copper sulphate, and the iron sulphide becomes converted into ferrous and ferric sulphates. The ferric salt exerts a powerful action on the oxidation of further quantities of copper sulphide, being thereby reduced to the ferrous state, then re-oxidized to ferric sulphate, and so on. The liquor issuing from the heaps contains a large proportion of iron as ferric sulphate, and in order to lessen the consumption of pig iron, this liquor is led through filter-beds of fine ore, so that the ferric sulphate becomes reduced mainly to ferrous. It may here be remarked that much more iron is consumed in precipitating the copper than is required by theory, and this excess consumption is reduced considerably, according to the proportion of the ferric salt present in the liquor, before it enters the precipitation-vats. The number of these vats, which are filled with cast-iron pigs, and the length of the series are determined by the work done by the iron; that is, when the iron consumed costs more than the worth of the copper precipitated, the liquor is run to waste. In the iron precipitation process, the copper precipitate gets contaminated by the impurities present in the iron, and this affects the quality of the precipitate produced during the final stages. The pig iron used varies from 92 to 94% metallic iron, the remainder being carbon and phosphorus. In most descriptions of this leaching process the phosphorus is rarely mentioned. At certain stages of the process the precipitate will therefore contain considerable quantities of these two elements, carbon and phosphorus, and in addition arsenic from the ore itself. The arsenic also is chiefly thrown down in the final stages of the process. It is therefore desirable to collect the copper precipitate in grades of quality, as by doing so the precipitate will command a higher average price. The heaps, after having been denuded of their copper, are sold to sulphuric acid makers all over the world. On the average, the washed pyrite contains 45 to 50% sulphur, and the United States takes a considerably larger tonnage than any other nation.

This is a brief description of an important industry. It requires considerable skill to keep costs down to the lowest limit, and to effect this object it requires well-trained technical men who possess sound knowledge of mineral chemistry and metallurgical requirements. Some years ago the ore was roasted in heaps, but such enormous quantities of sulphurous acid fume were evolved that the agricultural country for miles around the mines was devastated, and the Spanish Government insisted that the mining companies should gradually abandon roasting and adopt the natural weathering process that is now universal—an enlightened policy having regard to the magnitude of the industry locally.

(2) The treatment of Spanish cupriferous pyrite exported direct to Great Britain and other European countries for sulphur and copper extraction. The composition of this ore is much the same as given under No. 1, except that it is richer in copper. This class of ore is first burned by the sulphuric acid manufacturer to extract its sulphur. This reversal of the order of operations as practised in Spain is an example of the influence of economics. In both cases the ore is essentially the same, but one or two per cent more copper permits of its direct shipment to centres where metallurgical facilities are greater, and where consequently a closer recovery can be made, the additional profit outweighing the freight. The burned ore is calcined with salt, and lixiviated with waters containing hydrochloric acid recovered from the furnace-gases by ordinary condensation. The residue, representing the bulk

*Abstract from *Journal of the Society of Chemical Industry*, December 31, 1910.

of the ore, is thereafter sold to the iron smelter. The liquors pass to vats where the silver and gold (present in very small proportions) are separated by means of soluble iodide, and then pass to vats where the copper is precipitated by wrought-iron scrap. The silver and copper precipitates are sold to smelters.

Perhaps I may be allowed to touch upon the Claudet iodide process used in conjunction with the ordinary Longmaid & Henderson wet copper process as practised on this class of ore, more especially as this process is now suffering a lingering death, and I have no interest in it, the patent having expired some years ago. I think I am correct in saying that no other chemical process has ever been able to make a profit out of an ore containing only 1 to 1½ oz. silver per ton and 3 gr. gold, as the Claudet process did some years ago. This was only possible on account of the conditions existing at the time. First, the price of silver was 5s. per oz. when the process was invented by my late father, Frederic Claudet; now the price is under 2s. 6d. per ounce. Second, it was only applicable to copper ores when treated by the Longmaid-Henderson process; these were practically limited to Spanish cupriferous pyrite. The use of this silver process does not interfere with the subsequent precipitation of the copper. In the Longmaid-Henderson process the roasted pyrite, called 'burnt ore', obtained from the sulphuric-acid makers and containing 3 to 4½% copper, is calcined with 10 to 15% rock salt, and the chloridized ore lixiviated with acid water; the resulting solution is then run into vats and the copper precipitated by iron. The strong chloride liquor held the silver chloride in solution, while silver iodide was found to be practically insoluble. The method adopted was to place a series of vats in front of the copper precipitation-vats, and separate the silver therein as insoluble argentic iodide by means of a soluble iodide; the liquor was allowed to settle, decanted, and passed to the copper precipitation-vats. The silver iodide was collected and reduced to spongy metal by means of zinc, the zinc iodide being used for a further precipitation of silver. About 1 oz. of silver and 2 or 3 gr. of gold per ton of original ore were saved, and large profits were made. Under normal conditions, about 10 to 15% of the iodide was lost. The only condition required in the iodide process is that the calcination of the burnt ore with salt needs careful regulation in order to prevent the formation of subchloride of copper, which, if formed in any considerable quantity, militates against the success of the process, cuprous iodide being produced with a loss in iodide. The silver residue, containing 500 to 15,000 oz. silver per ton, was smelted in the usual way.

(3) Pyritic smelting.—In this case it is the metallurgist who comes first. The direct smelting of low-grade pyritic copper ore, perhaps containing silver and gold, which by any other process would be of no value, is now successfully conducted in various parts of the world. The object to be attained is to perform the smelting operation in such a way as by a first smelting to obtain a matte containing 20 to 25% copper, then by a second smelting to obtain a matte containing 45 to 50% copper, the slag from this operation being rich enough to add to the first smelting. This rich matte is then run into converters of the bessemer type, and by blowing air through the mass the combustion of the sulphur is effected, a blister copper containing over 90% of the copper originally present in the ore is obtained, and 95% of the silver and gold is collected. Pyritic smelting has the advantage of avoiding the first roasting operation, as it deals with the metallic sulphides direct, in place of their oxides, and by utilizing the calorific value of a large proportion of both the sulphur and the ferrous iron in the blast-furnace, permits of a great reduction in the consumption of coke, an expensive item in cupola smelting. That portion of the iron which is oxidized forms a base for the silica and thus reduces the consumption of extraneous flux. The portion of ferrous sulphide that remains unoxidized falls as matte, carrying the copper with it.

Pyritic smelting is also practised with pyritic gold and silver ores containing but little copper. Some proportion of the latter is, however, necessary to act as a collector of the precious metals, which the ferrous sulphide matte alone is incapable of doing completely. As small a quantity as ½ to ¼% copper may, in some cases, be sufficient to effect the collection of gold and silver into the matte. Pyritic smelting, in spite of its apparent simplicity, demands constant watchfulness on the part of the metallurgist to secure its maximum advantages. This product is sold to the copper refiner and treated by electro-chemical means, separating copper of 99.9% and over, practically free from impurities, the silver and gold with the impurities remaining in the form of a mud, which is again sold to smelters for re-treatment.

The electrolytic refining of the blister copper is a task belonging to the chemist, but he plays an even more important part in the recovery of sulphur from the furnace-gases evolved in huge quantities during the smelting processes that yield the copper matte. This work has been forced on the chemist on account of the devastating effect of the sulphurous acid gases on vegetation. Agricultural land has suffered so much from their action that unless some method for their elimination from the air were found possible, pyritic smelting in most cases would have to cease, and large smelting works would be compelled to stop. The best way to suppress a nuisance is to turn the cause into a source of profit. During the last few years these deleterious gases have been turned to account, and large quantities of sulphuric acid are now made from them by the 'contact' process, and the intensive chamber process. In dealing with immense quantities of ore, as in pyritic smelting, every endeavor in the way of reducing working costs has to be made, and as the plant must be made and designed for as nearly automatic working as possible, the mechanical engineer takes a prominent part. I may mention here that the sulphuric acid is mainly used

for the manufacture of superphosphates, the raw phosphates being shipped to the works from a long distance. Thus, instead of pyritic smelting being a curse to the agriculturist, it becomes a blessing.

(4) Broken Hill lead-zinc-silver sulphide ores. Here the whole treatment consists in an association of chemical and metallurgical processes gradually evolved during a period of many years. The ore consists of an intimate mixture of galena and zinc-blende, with garnetiferous schist, but the rocky gangue has so high a specific gravity that it can not be separated by ordinary methods from the blende. Hence for many years the zinc tailing (after separation of the bulk of the lead) lay accumulating, in millions of tons, awaiting the advent of a suitable recovery process for zinc. At the present time the ore is crushed and jigged, and a concentrate produced containing 65 to 70% lead, 5 to 10% zinc, and about 20 oz. silver per ton of concentrate. This is smelted to obtain lead containing the silver and a small quantity of gold. The lead is desilverized in the ordinary way, producing almost pure market lead, and silver bullion containing an amount of gold sufficient at least to pay the cost of refining and a possible additional profit. Here you will realize that the metallurgist and the chemist are equally necessary.

The lead concentrate is now more successfully smelted by interposing, before smelting, an agglomeration process such as the 'pot-roasting' process, which consists in roasting concentrate mixed with lime, or carbonate of lime, yielding a product that is in a suitable mechanical condition for smelting, and making sulphurous acid more simply and cheaply. The first to prove the great efficacy and economy of 'pot-roasting' processes were Huntington and Heberlein, these inventors using lime. Carmichael and Bradford modified the method by the employment of gypsum. Savelsburg uses carbonate of lime. In essential features these various methods closely resemble one another. The crushed ore or concentrate, after incomplete roasting to a low sulphur content (say 6 to 7%), is mixed with a suitable amount of reagent, charged into a 'pot' or other receptacle, ignited at the bottom, and 'blown' by a strong air current. The reaction being strongly exothermic, no additional fuel is required, and torrents of sulphurous acid are evolved. After the 'blow' is complete the agglomerate is discharged (broken by the fall into suitably sized lumps), and sent direct to the blast-furnace for reduction to lead-silver bullion. Not only is the necessary agglomeration economically effected in this way, but richer sulphurous acid gases are claimed to result for utilization as acid, while, finally, the lead recovery is increased by some 6 or 7 per cent.

In producing the lead concentrate, the zinc tailing (a product known locally as 'middlings') carries considerably more zinc, weight for weight, than the original ore, considerably less lead, and about the same amount of silver. After years of experiment, physico-chemical processes have at length been devised for the treatment of this product also. It is ground fine, pulped with slightly acid water, and then stirred with a small quantity of oil. The oil coats the particles of sulphides with a thin film. These oiled particles are brought to the water surface and, having once broken through it, they float by virtue of the surface tension of the water. In two or three instances the raising of the oiled sulphides to the surface is effected by causing small gas bubbles to become attached to them while submerged. The scum or film of valuable metals is removed by different mechanical methods, while the gangue or valueless material is left unaffected in the liquor, and after subsidence and separation, is sent to the waste-heap. Over a million tons of accumulated tailing has been treated at great profit by this essentially physical method, and Broken Hill has now become as great a zinc producer as it formerly was famous for its lead and silver. Already one mine alone produces one-tenth of the world's total output of zinc ore. In this way, valuable products are obtained at the present time. Here the physicist, the chemist, and the mechanical engineer help the metallurgist. If, however, this zinc concentrate is smelted for the production of spelter on the spot, then the metallurgist takes a prominent position; but the chemist does also, for in the production of spelter the concentrate must be roasted, and he has to endeavor to turn to account the sulphurous fume from the roasting to form sulphuric acid, to be used, if possible, in the production of superphosphates.

(5) The manufacture of copper sulphate. At first sight this would seem to be a chemical process, pure and simple, but on looking into it, various metallurgical operations are found to play a part in the process. Copper sulphate is produced on a large scale, either by the direct treatment of smelted copper or as a by-product from some other process, such as in the refining of silver and gold bullion, where copper is used as a reagent, and has to be recovered.

As a direct process, the smelter in its operations produces copper bars, which may contain silver and gold; these are granulated and treated with sulphuric acid, and, with the aid of air, the copper is brought into solution, from which the copper sulphate is crystallized out, leaving an insoluble residue which is smelted for its silver and gold. An important factor in this process is that iron sulphate, the enemy of copper sulphate, is nearly absent from the copper sulphate crystals. As a by-product, this salt is obtained in the process of refining silver and gold bullion, a suitable alloy being made up by melting the bullion with silver 2¼ times the weight of gold and copper ¼ the weight. This mixture is granulated and boiled with sulphuric acid in suitable vessels; the gold remains as a mud, which is collected and melted into bars; the silver goes into solution and is precipitated by metallic copper, to be melted into silver bars. The liquor is then subjected to crystallization and yields copper sulphate, thus recovering in a marketable form the original copper added in the refining process to precipitate the silver.

(6) The cyanide process of gold extraction is an

instance of the help that the chemist can give the metallurgist. It is a purely chemical process, which both increases the extraction of gold from ores and enables greater profits to be made than if any other process were adopted. Although apparently simple in application and in the plant required, reactions of great complexity occur, and as the cyanide solutions are used over and over again, they become highly complex in constitution and require careful study, because the compounds produced may accelerate or retard the solution of gold. The zinc-gold mud produced has to be refined by acids, and smelted to produce bars of bullion. One process of refining this mud is cupellation with litharge in a large furnace, involving a purely metallurgical operation. Without the aid of the cyanide process, the gold extraction obtained from the Rand ores would be 20 to 30% less than at present. The application during the last few years of the process to silver ores, especially in Mexico and the United States, must be noted. The large quantity of cyanide required for precious-metal extraction necessitated improvements in its manufacture to reduce its cost of production, and thus the metallurgy of gold has benefited a large chemical industry.

It may be recalled that at the outset of the cyanide process potassium cyanide cost 4s. per pound, and the consumption of this chemical was high. Thanks to the aid of the industrial chemist, potassium cyanide now costs nearer 6d. per pound, while the consumption has been reduced (as regards loss) to but very few ounces per ton of ore. In a recent case brought before the notice of the Institution of Mining and Metallurgy the total cost of extracting gold from one ton of ore, for potassium cyanide, power, and labor, amounted to only 11 pence.

(7) **The Pearce process** of treating auriferous copper was the product of both chemist and metallurgist. The main feature in this process, which has now been replaced by later methods, was the discovery by Richard Pearce that a granulated alloy of copper and gold, when melted with iron pyrite, yielded some of its copper to form a matte, but the gold remained in the unattacked copper; by repeating the process a number of times the whole of the copper is separated from the gold. This method was worked in conjunction with the well known Swansea smelting and the Ziervogel processes, the latter of which is of a purely chemical nature.

(8) **Treatment of the arsenical cobalt and nickel-silver ores** now being mined in Ontario affords an interesting field for research work for the chemist and the metallurgist. These ores are rich in silver, often yielding several thousand ounces per ton. Great difficulties are involved in their satisfactory treatment; arsenic may reach up to 30%, cobalt and nickel 10 to 15%, in each case. Efforts have also been made to save not only the silver, but also the cobalt, nickel, and arsenic. The present treatment is to smelt these ores with lead, thereby extracting a large proportion of the silver; in this operation a speiss is obtained consisting of arsenic, cobalt, and nickel, with several hundred ounces of silver per ton.

DONT'S AND EXPLOSIVES

Miners' Circular No. 1, the first of a series to be written in plain, non-technical language for the benefit of the miner, has just been issued by the Federal Bureau of Mines. It contains the names of the permissible explosives tested by the Bureau at its Pittsburg station up to November 15, 1910, and gives precautions as to their use. Permissible explosives give a short and relatively cool flame that is less likely to ignite inflammable gas or coal-dust than is the longer and hotter flame of dynamite or the longer and much more lasting flame of black powder. Because they can be used with greater safety, permissible explosives have taken the place of other explosives in many coal mines in the United States during the last two years, and their use is increasing rapidly. The following precautions are urged by the Bureau of Mines: Don't store detonators with explosives; don't open packages of explosives in a magazine; don't open packages of explosives with a nail-puller, pick, or chisel; don't store explosives in a hot or damp place; don't store explosives containing nitroglycerin so that the cartridges stand on end; don't repair a magazine until all explosives are removed from it; don't use permissible explosives, or other explosives, that are frozen or partly frozen; don't thaw frozen explosives before an open fire, in a stove, near a boiler, near steam-pipes, or by placing cartridges in hot water; don't put hot water or steam-pipes in a magazine for thawing purposes; don't carry detonators and explosives in the same package; don't handle detonators or explosives near an open flame; don't expose detonators or explosives to the sun for any length of time; don't open a package of explosive until ready to use the explosive, then use it promptly; don't handle explosives carelessly; don't use more than 1½ lb. of any permissible explosive for one shot in a coal mine; don't use a detonator (blasting cap) or electric detonator of less strength than No. 6; don't crimp a detonator (blasting cap) around a fuse with the teeth; don't economize by using a short length of fuse; don't use in a gaseous coal mine any fuse or other device which emits flame or sparks; don't use coal cuttings or 'slack' or any combustible material for stemming; don't use a metal tamping-rod—a copper-tipped rod is not to be recommended, wooden rods being safer; don't use two kinds of explosives in the same drill-hole; don't return to the face until at least five minutes after a shot has been fired; don't breathe the gases from the shot; don't return to the face after a misfire for at least one-half hour; don't attempt to draw the charge in case of a misfire; don't leave any detonators or explosives in a mine over night; don't charge or load any hole which has not been properly placed or has been drilled 'on the solid'; don't light the fuse of dependent shots at the same time the first shot is lighted; don't expect to get satisfactory results wih a permissible explosive or any explosive when a miner uses it for the first time; don't think that permissible explosives can take the place of other precautions.

A South Dakota Dredge

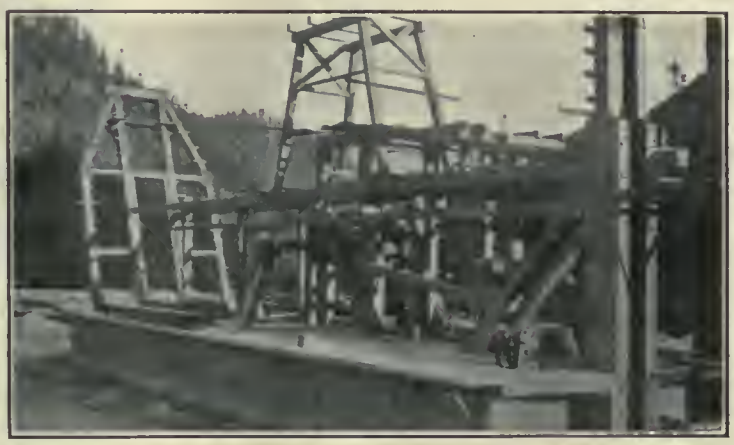
The Castle Creek Hydraulic Gold Mining Co., owning placer ground near Mystie, in the central part of the Black Hills, expects to begin dredging this spring. The hull and framework have already been erected, and the machinery is to be set up as soon as the weather will permit. The dredge is being built by the Stearns-Roger Manufacturing Co. of Denver, under the supervision of J. R. Henderson, whose long experience with the Yuba Construction Co. and the Boston machine-shop at Oroville, assures a good boat. The dredge is of the California type, with close-connected buckets of 5-cu. ft. capacity. The hull is 102 ft. long, 36 ft. 7 in. wide at water-line, 42 ft. wide at deck-line, 7 ft. 10 in. deep, and contains about 230,000 ft. of the best Oregon lumber. The accompanying figure gives a very good view of the boat, showing the framework. It will be noticed that standard lines have been closely followed. One particular feature in connection with the framing is the substitution for the old cast-iron washers, which are placed on top of the stringers, of an angle-iron connection, doing away with all cast iron in the framing and giving a much safer material with which to work.

The upper and lower tumblers, main driving-gears, the buckets, and the rollers, are made of Tiseo steel. The digging ladder, of structural steel, is designed for work at a depth of 35 ft. below water-line. The revolving screen is 6 ft. outside diameter, 26 ft. long over all, and composed of six longitudinal T-bars, 4 by 4 by ½ in. The perforated screen-plates are made ½ in. thick, the holes being reamed to give a slightly larger outside diameter to allow material to pass freely. On the inside of the screens are placed longitudinal bars for breaking up the clay balls. The screen is carried on friction rollers in the usual way.

The pumps are of Buffalo Steam Pump Co. manufacture, and are of the standard centrifugal type, the main pump being 10 inches and the auxiliary 3. These pumps are direct-connected to electric motors. The entire dredge is electrically driven, the motors being of General Electric Co. manufacture, 2300 volts, alternating current. The current is furnished by a power-plant placed on the bank, equipped with horizontal tubular boilers, Corliss engine, and General Electric generator.

The spuds are 24 by 36 in. and 50 ft. long. In steel spuds the method of construction has required countersunk rivet-heads, which, as ordinarily made, weaken the structure. The tremendous strain concentrated upon the spud point causes the rivets sooner or later to loosen, and makes replacement of the spud necessary, together with extensive repairs. To overcome this trouble the builders of the Castle Creek dredge are providing a special construction whereby, by means of angle-iron covering, the line of the spud is brought out beyond the edge of the web plate, so that the rivet-heads can be left full; in other words, they are not required to be countersunk, with the exception of the few heads which come directly into the angle-iron protector. Another detail is the milling off of the lower end of the structural portion of the spud, so that where it enters into and rests upon the cast-steel spud point, the fit is accurate. The cast-steel spud point is made with a shoulder, and the recess caused by this shoulder, into which the structural portion enters, is also machined. This gives an excellent bearing point, with contact all over the surfaces on the sides taking the pull. The spud point is made extra long and of circular section, so that there are no projections or angles to catch when swinging the dredge.

The stacker ladder is approximately 100 ft. long and carries a 30-in. wide, 7-ply conveyor-belt. The idlers are troughing, of the Webster manufacture. The lower tumbler-bearings are of the swivel type, similar to those in use on the El Oro dredges at Oroville. In general, the dredge follows the latest approved construction, but in many details innovations have been made. For instance, larger bearings and a larger proportion of pin area have been allowed. These, though unimportant as regards the general construction of the dredge, are expected to prove extremely important as bearing on the continuous operation of the machinery and of the parts of the dredge, as well as on repair costs.



Castle Creek Dredge, Mystic, South Dakota.

WORLD'S SPELTER PRODUCTION

United States Geological Survey figures for 1909 and 1910, compiled by C. E. Siebenthal, are as below, the figures being given in tons of 2000 lb., and those for 1910 subject to revision.

Locality.	1909.	1910.
Australia	.....	560
Austria and Italy	13,931	14,667
Belgium	184,194	190,243
France and Spain	61,859	64,075
Rhine district (Germany)	82,863	96,454
Silesian district (Germany)	159,731	154,605
Great Britain	65,422	69,535
Holland	21,548	23,123
Poland	8,758	8,960
United States	255,760	269,184
Total	854,066	891,406

Proposed Mineral Law for State of Texas

The following is an abstract of a proposed new law governing the entry and purchase of mineral lands in Texas. The original draft was prepared by a committee from the Chamber of Commerce of El Paso, and a copy has been furnished by H. Vincent Wallace, one of its members.

Section 1.—All land which is now owned by the State of Texas, or the Public Free School land of said State, Asylum, and University land, and all land which may hereafter be so owned, also all land so owned which has been heretofore sold with a reservation of minerals therein, are included within the provision of this Act, and shall be declared to be free and open to exploration, location, and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and none other shall acquire rights under this act.

Section 2.—That mineral lands or claims referred to in this Bill shall be known respectively as: (a) lode claims; (b) bedded deposit claims; (c) oil or natural gas claims.

Section 3. Lode Claims.—Mining claims upon veins, lodes, reefs, or ledges of quartz or other rock in place, bearing gold, silver, lead, tin, copper, antimony, bismuth, cinnabar, zinc, vanadium, molybdenum, uranium, manganese, or other valuable deposits shall not exceed 1500 ft. in length by 600 ft. in width, measured in a horizontal plane, and no location or filing of a lode claim shall be made until the actual discovery of the vein or lode in place within the limits of the claim located. The claim or location shall be rectangular in form. The two ends and the two sides shall be parallel respectively.

Section 4.—The locators of all mining locations on lode claims heretofore made or which shall hereafter be made on any mineral vein, lode, or ledge, situated in the State of Texas, their heirs and assigns, so long as they comply with the laws of the State of Texas governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their location, and all veins, lodes, and ledges which lie inside such surface lines extended downward vertically, and nothing in this Section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim, to enter upon the surface of a claim owned or possessed by another.

Sections 5 to 9, covering Contents of Location Notice, How to Locate a Lode Claim, Equivalent Discovery Work, Time for Discovery Work, and Annual Expenditure, are similar to the corresponding provisions of the State Law of Arizona.

Section 10. Affidavit of Annual Labor.—This provides for the filing of an affidavit in the usual form, on or before March 31 of each year.

Section 11. Bedded Deposit Claims.—Deposits of alum, asphaltum, soda, sulphur, kaolin, fire-clay, borax beds, auriferous cement or auriferous gravel, marble, mica, slate, gypsum, phosphate, guano, and deposits containing precious stones or gems which do not occur in veins, building stone, and coal shall be known as bedded deposit claims. Also bedded deposits or finely disseminated sheets of porphyry rock which contain copper or other valuable mineral but which cannot be traced as veins on the surface shall be classed as bedded deposits.

Section 12.—A bedded deposit claim shall be subjected to location and entry in the same manner as for a lode claim, except that their exterior limits shall conform to the legal subdivisions of the Public Survey, and the size of the claim is limited to 20 acres to each individual or person, and an association of persons may locate a claim in common, not exceeding 20 acres to each individual in the association, and not exceeding 160 acres to the entire association.

Section 13. Provision for Locating Lode or Bedded-Deposit Claims on Lands, the Surface Rights to Which Have Been Sold by the State, with the Reservation of Minerals Thereon.—In the event any land included within the operation of this Act has been heretofore sold by the State with a reservation of the mineral therein for the State or University or Asylum or Public Free School fund or has been purchased by one with a waiver of such one's right to the mineral therein, or if such land should be sold or purchased, the mineral therein which comes within the provisions of this Act shall be subject to prospecting and location, either as lode or bedded-deposit claims, as hereinbefore provided, and may be sold by the State as hereinbefore provided. Anyone desiring to prospect in land described and specified hereinbefore in this Section 13, shall proceed in the following manner: In case the owner or owners of such surface rights and the person or persons making the discovery or location cannot agree as to the value of, or damage to such surface rights, then each party or parties shall name an appraiser and both appraisers present their valuation to the owner and locator, respectively, within fifteen days time counted from the day they are nominated. If the appraisers do not agree, the matter in controversy or right, shall be subject to arbitration as provided in Title 6, Chapter I, Texas Civil Statutes, Volume 1.

Section 14. Patents for Lode and Bedded Deposit Claims, How Obtained.—Any person, association, or corporation authorized to locate a claim under this Act, having claimed and located a piece of land for such purposes, who has or have complied with the terms of this Act, may file in the General Land Office an application for patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the General Land Office, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an
